The Rural New-Yorker.

VOLUME XXXVIII, 1879.

INDEX TO ILLUSTRATIONS.

ARBORICULTURAL.

Abies Sibirica, twig of.....567
Cladrastis Tinctoria, Yellow wood.....637, 639
Fence, Western Live.....135
Frankincense.....456
Magnolia Lennei.....573
— Parviflora.....534
Maple, Japanese.....701
Pinus Ponderosa Pendula.....37

APIARIAN.

Bee-Veil.....328
Hive, Langstroth-Doolittle.....344
— — lower and upper story.....423
— — movable comb.....343, 344
— — position in Apiary.....456
— — Observing.....328
Honey Sections, surplus.....579
Queen Cells.....360

BIOGRAPHICAL.

Bedford, Duke of.....501
Downing, Charles.....517
Gray, Dr. Asa.....517
Johnson, Prof. S. W.....188
Wales, Prince of.....501
Wilder, Marshal P.....341

DAIRY HUSBANDRY.

Butter Stamper.....69
Cheese Press, home-made.....487
Churning Power, handy.....135
Self-Milking, preventive of.....473

DOMESTIC ECONOMY.

Dumb Waiter, for farmers' wives.....805
Fruit Cans, uses of.....216
Grater, horse-radish.....216
Scoop, flour.....216
Table, "Rural" housekeepers'.....568

ENTOMOLOGICAL.

Bag.....535
Bed Bug.....327
Beetle, pinned.....549
Cyanide Bottle.....535
Dog Flea.....293
Forceps.....535
Hen Mite.....314
Insect Breeding Case.....549
Louse, Cattle.....328
— Crab.....328
— Head.....328
— Ox, foot of.....327
Net.....535
Pinning Forceps.....549
Plant Lice, wing, venation of.....58
Sheep Tick.....312
— — head of.....312
Spreading Board.....549

FARM ECONOMY.

Cisterns, manure.....7
Corn Crib, excellent.....519
Cultivator, hand.....439
Fence, convenient.....623
Fruit Cans, uses for.....216
Harrow, a good.....704
Horse Power, home made.....560
Lime Kiln.....55
Lime Pit, foundation for a.....55
Rack, feed.....7
Root Cutter.....407
Sled, easy-dumping.....805
Smoke-house, home-made.....820
Snow-Plow (4 Illustrations).....836
Stone Boat.....344
Thether-Pegs.....704
Trough, water.....7

FARM TOPICS.

Corn Marker.....376
Drag Teeth, how to slant.....520
Farmers, portraits of.....85
Fence, convenient.....623
— wire.....362
Fish Pond, Farmers'.....686
Gate, Lee's.....53
— slide.....53
— Teel.....53
Knife for cutting fodder.....69
Lime Kiln.....55
Lime Pit, foundation for a.....55
Plow Sled, English.....520
Rope Knots.....719
Rope, whipping the ends of.....719
Silo for green fodder.....69
Smoke House, home made.....134
Summer Visitors, our.....5
Tank, a surface.....202
Trough, hog.....134
Wagon Jack.....567, 623

FIELD CROPS.

Corn, Blunt's White Prolific.....149
— — — — cob of.....153
— — — — ear of.....152
Cow Pea, Southern, Dolichos Sinensis?.....817
Cranberry Culture.....752
Millet, Pearl.....9
Oats, Mold's Ennobled.....569
Potato, Alpha.....670
— Beauty of Hebron.....671
— Bliss's Triumph.....672
— Brownell's Beauty.....670
— Burbank's Seedling.....674
— Centennial.....672
— Cutting to a Single Eye.....675
— Extra Early Vermont.....671
— Improved Peachblow.....677
— Late Snowflake.....677
— Manhattan.....669
— Power's.....591
— Ruby.....679
— "Rural".....673
— Snowflake.....677
— St. Patrick.....671
— Superior.....669
— Washington.....674
Potato Mound.....671
Root Crops, planting of.....440
Sorghum, Drooping.....39
— Dwarf.....39
Tobacco, method of curing.....520
Wheat, Arnold's Gold Medal.....589
— Clawson.....591
— — cultivated plant.....357
— — uncultivated.....379
— Diehl.....591
— English Square-Head.....589
— Fultz.....589
— Fultz and Clawson, crosses.589
— Gipsy.....687
— Lancaster.....591
— Lincoln.....591
— Saniomirka.....589
— Silver Chaff.....589
— Swamp.....570
— Velvet Chaff.....591
— Yellow Missouri.....570
Wheat Grain.....492

FLORICULTURAL.

Aquilegia, Bebb's.....568
Carnation, a tree.....624
Dianthus Caryophyllus.....262
— Diadematus.....262
— Heddewigii.....262
— Imperialis.....262
Hibiscus cæcineus.....57
Ipomœa Leptophylla.....579
Iris Iberica, var. Insignis.....585
Iris Isevigata Seedling.....573
Log, hollow, with trailing annuals.....230
Pits for wintering plants.....768
Rustic Vase Supporters.....105
Tillandsia Usneoides (Florida moss).....117
Vase, hollow tree as a.....280

GARDEN.

Artichoke, Cynara scolymus.....120
Cauliflower, Lenormand's Short-Stemmed.....121
Celery, Early Dwarf.....232
— Turnip-rooted.....232
Egg Plant, Early Long Purple.....169
Pea, Telephone.....567, 570
Pepper, Capsicum annuum.....156
Pits for gardeners' stock.....621
Radish, Raphanus sativus.....156
Sea Kale, Crambe maritima.....216
Squash, Hubbard.....169
— Turk's Turban.....169
Tomato (Lycopersicum esculentum).....184
— Acme, Red Smooth.....184

HERDSMAN.

Animals, prize at Kilburn, 503, 508, 509
Anti-Sucking Device.....768, 789
Bull, short-horn, "Rear Admiral".....821
— — "Royal Windsor".....821
Cattle, Polled Angus of Paris..104
— "Duke of Underley," Earl Bective's.....437, 469
— "Empress".....213
— Feeding Pail, calf's.....768
— Galloway.....104
— Hereford Bull.....76, 245
— "Jelgle".....25
— Long-horns, heads of.....705
— "Mormay".....41
— Norfolk.....104
— Polled Angus, "Gally".....213
— Short-horns.....749
— "Success".....245
— "Telemachus 9th," Lord Exeter's.....489

HORSEMAN.

Horses' Legs.....640

HORTICULTURAL.

Amelanchier Canadensis, Var. Alnifolia.....453
Andromeda Mariana.....421
Aristolochia Sipho.....566, 567
Experimental Grounds of R. N.-Y.....565
Fence, Western Live.....135
Hydrangea, New Climbing, Schizophragma Hydrangeoides.....101
Mats, To make Straw.....805
Persimmon, Japan (Diospyros Kaki).....296
Pits for Wintering Plants.....768
Raspberry, Cuthbert.....571
— Hawthorn.....719
— Montclair.....521
Roses, Standard, To Winter.....788
Strawberry, Charles Downing..408
— Lincoln, largest ever raised.569
— Pioneer.....408
— Sharpless, No. 1, 2, 3.....408
Wistaria, double.....264
Vitis Indivisa.....261

INDUSTRIAL IMPLEMENTS.

Cart for Oxen.....363
Churn, rectangular and Box....229
Corn Marker.....376
Corn-Sheller.....105
Cultivator, Hand.....439
Cultivator, La Dow's.....156
Drill, New Buckeye.....505
Drill, New Seed.....217
Engine, Birdsall.....411
— New Traction.....329
— Payne's New.....457
— Traction Attachment.....49
— Watertown.....233
Grain Drill, small.....409
Grain Fan, Rockaway.....361
Harrow, a good.....704
Hay-Press, Lever Perpetual....121
— — Perpetual.....121
Horse Power, home-made.....360
Knife Grinder.....297
Mills Bradford Under-Runner.721
— Dickey's Fanning.....377
— flour, corn and feed.....737
— "New Era" Portable.....813
— Plantation.....9
— Planters' Pride.....705
Mower, Woods Enclosed.....361
Plow.....247
— Conical.....249
— for Sub-soil Plowing.....607
— Sled, English.....520
— Western.....106
Potato Masher.....670
Rake, Lion.....345
Root-Cutter.....407, 520
Scales, Osgood's Patent.....425
Shingles, metallic.....241
Shops of Leffel & Co.....377
Stump-pullers, screw.....233
Thether-pegs.....704
Wagon-Jack.....623
— Watertown.....217

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXVIII. No. 1.
WHOLE No. 1510.

NEW YORK CITY, JAN. 4, 1879.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1878, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

OUR SUMMER VISITORS, AS SKETCHED FROM LIFE AT THE RURAL FARM.

Farm Topics.

THE FERTILITY OF THE SOIL.

J. B. LAWES, OF ROTHAMSTED, ENGLAND.

It is a well-established fact that coal and the various carbonaceous deposits found below the surface of the soil, are derived from an extinct vegetation. If no such deposit existed, and our only supply of fuel were derived from living vegetation, the present condition of man upon the earth would be altogether different from what it is.

Our dependence upon an extinct vegetation for our supply of food, as well as for our fuel, has not, I believe, up to the present time, been in any way the subject of discussion. Our investigations regarding the exhaustion of soil have made it appear possible, or perhaps probable, that fertility, or the power possessed by soils to furnish food for man, is largely dependent upon the residue left in the soil by a previous generation of plants. Owners and cultivators of the soil are constantly complaining of its exhaustion, and they probably may think that a process so easily performed, can hardly be worthy of scientific investigation, whereas, carried out with care and over periods of time sufficiently long, such investigation is capable of yielding very valuable information.

In a field set apart for growing continuous wheat crops, thirty-nine years have elapsed since certain parts of it received manure of any sort. Two bushels of wheat are drilled on the acre every autumn, and the straw and grass removed. Every one might safely predict that under such treatment the produce would decline; but the slow rate of decline, and the very long period which must yet elapse before the soil ceases to grow wheat, would hardly have been anticipated. Adjoining this unmanured plot is one which received every year a supply of all the necessary mineral food of the wheat plant, the quantity being more than that contained in the largest possible crop. The produce in this experiment is so slightly larger than that of the unmanured space, that an experienced eye could hardly detect any difference between the two crops.

To what are we to attribute this want of effect upon the wheat by these manures? It may be said that these manures are not supplied in a form suitable for the plant to assimilate; our answer to this is, that the same minerals when applied with ammonia or nitric acid, will produce a crop two or three times larger. We must, therefore, look for some other explanation, and it is difficult to attribute it to any other cause than to the absence of active nitrogen.

In all soils nitrogen is found in various combinations, as nitric acid, as ammonia and in combination with carbon. It is in the last form that by far the largest quantity exists, and it would appear probable that the ammonia and nitric acid are principally derived from the decomposition of this carbonaceous matter. Our soil still contains large quantities of organic carbon and nitrogen, still the quantity is sensibly declining and the crop is declining with it, and at present it does not appear quite evident what is to prevent the complete exhaustion of the soil taking place when the whole of the organic matter is gone.

It is said that plants can assimilate free nitrogen; that rains and dews furnish ammonia to the soil; that the soil condenses nitrogen in its pores; that the slow combustion of organic matter within the soil produces nascent hydrogen which unites with nitrogen forming ammonia. Without attempting in any way to estimate the value of these several processes for furnishing nitrogen to plants, I will merely remark that our wheat crop will derive as much benefit from them as the wheat in other fields, still the nitrogen obtained from these sources as well as from the organic matter stored up in the soil by a previous generation of plants, has not prevented a gradual decline in the crop. It would appear that upon an ordinary soil having a clay subsoil, the mineral food of the wheat is largely in excess of the nitrogen obtained both from soil and atmosphere. As nitric acid is constantly passing away in the drainage water, we may assume that the ammonia supplied by rain, dew, or condensed in the soil, is converted into nitric acid and unless arrested by the plant, escapes into the drains. A similar process goes on when the organic matter in the soil is decomposed. Nitric acid and ammonia appear to represent the active and transitory fertility, while the organic nitrogen forms the inactive but durable fertility.

In what manner these large amounts of organic matter have accumulated in our soil, I do not attempt to explain. Upon the newly cleared land in the States some of the organic matter would be due to recently existing vegetation, but upon land similar to mine which has been under arable cultivation for centuries, and which has for nearly forty years been subject to exhaustion, we must go back to a very remote period to account for so large an accumulation of organic matter yielding nitrogen.

HINTS FOR JANUARY.

LOOK BEHIND AND BEFORE.

Many of the hints for last month are equally applicable for this. Now is the time to make plans for the campaign of 1879. Take an inventory of the farm-stock and everything on hand. If this has never been done before, the proprietor will doubtless be surprised to find how much he owns. Straighten up the books, and the little debts, and collect those due from neighbors. Small accounts should not run long. Trust not to memory. Arrange the books for the business of the year. Study over the plans considerably in detail, and do not wait till the ground is ready to plow before deciding what to do. Look over the past and study the good hints and the failures—whether all was done to the best advantage; whether there was too little or too much help. This should lead to better plans for the future. Nothing can bring larger returns, for the time, than a few weeks spent in accordance with the above suggestions.

ENGAGE HELP.

Look about early in the season, and get your pick of hands in the market. Make a written bargain in detail, no matter if you are well acquainted. This will prevent misunderstanding. The man agrees to remain a certain number of months; to perform certain chores Sunday, or holidays; to start about such an hour in the morning, and close at such an hour in the evening. If, in case of an emergency, he works longer, he may have certain privileges to compensate for it. In case he quits before his time is out, he only receives a certain stipulated sum.

CARE OF CELLARS.

If they are too cold, bank up the outside with something, or place a double thickness of newspapers over the windows. This lets in some light and prevents the escape of heat. A double floor, or a fire in the room over the cellar, will help to keep out the frost. A kerosene stove in the cellar may be used in extreme cases. Ventilate on suitable days, and clean out decaying vegetables and fruits.

WOOD, TOOLS, ICE.

Cut a supply of wood, posts, rails, and logs for lumber, ready to be moved easily on the advent of sleighing. No thrifty farmer will leave these things to be done in the busier seasons. Get wagons and buggies repaired and painted, as well as tools and implements for summer use. Make stone-boats, cut hand-spikes and stakes, and get ready everything which can be got ready. Snow may be scraped from the ice to keep it clear and allow it to freeze thick. If you have never tried it, build a cheap ice-house, and enjoy a cheap luxury next summer. The cakes should be cut of even size, and set on edge close together. There should be perfect drainage at the bottom, but no recess of air. Around all, place a layer of eighteen inches of sawdust.

COWS.

Treat them generously and kindly, but do not keep them fat, unless they are to be turned off for beef. A cow is a machine, a laboratory for converting raw materials into milk. If little be given, little will be received. All animals should have exercise, especially those kept for breeding. Some of them are naturally lazy, but they will be the better for stirring about in the open air. It is cruel to keep animals tied up or shut up for days at a time. They need light, too. Direct sunshine exerts a powerful influence for good on animals, as well as on plants. Do not overlook a good supply of pure water two or three times a day; or good ventilation and proper cleaning of stables. When the ground is frozen and covered with snow, it may be well enough, on pleasant days, to scatter the fodder, and allow the stock plenty of room to pick it up, but when it is muddy, no one but a sloven will fodder on the ground. Good racks should be made for the sake of convenience and economy.

CALVES AND SHEEP.

Lard and kerosene are good to keep lice from calves; sulphur mixed with salt is good to drive ticks from sheep. Calves, like all animals, should be kept growing from birth to maturity. Here is one place where the profit comes in. There is always a loss of time and feed and more, too, by allowing young animals to "stand still" for six months or more of the year. Sheep are well clothed, and need shelter from snow and rain, and perhaps from the very strongest winds, but cold agrees with them. Feed them well; give them plenty of water, in small flocks; keep them dry, and they may stay out in the cold and thrive. A close dark pen is a poor place for sheep.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

A GOOD WORD FOR PEA CULTURE.

WHY are not peas cultivated to a greater extent, as a field crop, in the Eastern States? They yield well on good soil, and ripen early, making one of the best of foods for swine in fall. Cooked, or soaked in milk until soft, they are excellent for fattening purposes, and their ripening so early makes them available before corn is husked. In fact, we have yet to learn that corn is superior to them. Mixed with oats, and ground, they are excellent for horses or cattle. Sheep eat them greedily, and fatten on them. They increase the weight of the wool, though not as much as beans. There is not so much oil in the former, as in the latter. After a crop of peas, the land is left clean, mellow, and rich. At least it has not been exhausted by the crop. The land from which they are taken, is left in fine condition for wheat, or for any other cereal. We have been successful in seeding to clover after peas. To sum up, there are very many reasons why peas may be raised with profit as a field crop. We would not sow the small, common field pea, but the large black-eyed Marrow-fat. They are usually of quick sale at good prices for seeding in spring. We always calculate to raise enough every year, to get the pigs well started, then finish with corn. We have sold bushels of them for cooking, when green. They yield fully as well as the small variety, and the latter are not fit for table use. Each farmer should sow a small piece, at least. As an old acquaintance remarked the other day, "they are handy to have around, anyway."

ECONOMY IN FATTENING PIGS.

We are giving the pigs all they will eat. They gain faster now than after it becomes cold, and require less grain to give them the same amount of fat. "Which is more profitable for fattening purposes: pigs at six months, or a year old?" is a question we have often asked ourselves, and have decided in favor of the latter. Young pigs while growing, require much more food to fatten. They must be fed heavily the entire season. Pigs that are wintered fatten quickly the following fall, and cost no more than those six months old. It costs but little to winter them. We have pigs that were a year old last month, that weigh over 300 pounds, and in the same pen, separated by a partition, others six monts old, that will scarcely weigh 200 pounds. The cost of feeding has been carefully estimated, and we are satisfied that the ones that weigh the most, cost the least. They are grade Berkshires.

LEAVES IN THE PIG-PEN.

Leaves make excellent bedding for pigs and we are gathering large quantities for that purpose. No animal requires more bedding, and none, we fear, receives less, as a general thing.

A SOILING EXPERIMENT.

M. OAKEY.

My experiment was nothing remarkable. I had either to rent land for pasture or soil my cattle, and believing the latter the better course, I adopted it. The results are nothing to excite wonder, nor are they particularly noteworthy. But facts are always in demand, and those which testify to ordinary practices and possibilities are, after all, the facts of most interest to the farmers generally. Too often those published spring from extraordinary causes, and indicate extraordinary efforts. My experiment cannot be classed among such, and therefore may be of value to others besides myself. Very many refused to adopt the system of soiling, because reluctant to undertake measures so revolutionary, and because, too, so many of its advocates are so enthusiastic over it as to cast doubts upon it, by trying to prove too much, and thus appearing prejudiced.

This was my first trial. It was therefore to be expected that I should make mistakes. I see now where I might have saved myself not a few dollars. Let me say, too, that almost every farmer would be better situated to take up the system than I was, for I had no clover to fall back upon, as it had failed to catch. I used very little timothy and depended entirely upon the crops grown during the season.

My dairy consisted of three cows and the land used was a trifle over two acres and three-quarters, more than half of which was in poor condition and badley run out. My object is butter making. Contrary to general custom, I have my cows fresh in fall, and dry them off in July and August. It was not of great importance to me therefore whether my cows were well fed in summer or not, because there was no need that they should be fed high, as they were not forced in milk or butter.

I will compare, then, the cost of soiling with that of pasturing. I could rent pasture at $2 per month per cow. The account would be as follows:

7 months pasture, 3 cows, $2 per month	$42.00
SOILING.	
2 acres fodder corn, labor and seed....	$22.25
½ do oats and ½ rye do do.....	6.00
Stable manure, guano and plaster.....	19.15
	47.40
Deduct twelve loads manure in yard,	18.00
Total cost seven months' soiling,.....	$29.40
Difference in favor of soiling,.....	$12.60

This is the actual expense, as kept from day to-day. Much more manure than this is saved, but I have allowed something for what would have accumulated during the night, if the cows were pastured. The $18 worth credited above, would have been dropped on neighbors' fields instead of in my yard. It returns almost the total expenditure for fertilizers used. The time required to cut the feed needed every day was less than an hour per day. The expense for the seven months would not be over $2, at the rate of wages I paid. I do not consider it; for the time lost in driving to and from pasture, &c., would balance it.

But there are other things to be considered. I used sweet corn almost entirely. I found the cattle ate field corn equally well, and the result in milk was the same. Sweet corn cost me $6 more than field corn would have done. The manure used is charged against this crop, but is hardly fair, for it is not exhausted by it, but much remains to enrich next season's growth.

After the quarter acre of rye was used up, I had it plowed and millet was sown June 11th at an additional cost of only $1.50. Besides this, I had sown in May two acres of peas and oats in equal quantities, which cost me, with the manure and plaster used, $24.40 I am now feeding the hay made from these two acres. With the millet I have enough to carry me through to the last of January. Add these items, $25.90, to the cost of the summer's soiling, $29.40, and the total is $55.30. This covers the cost of ten months. Last year it cost me to feed and pasture for the corresponding ten months $102.85, making a saving this year of $47,15, I am satisfied with this without comparing the yield in butter of the different years, especially when I know without going to the figures that the flow of milk was more constant and that the expected quantity was always returned without variation, when soiling. I had hoped, however, to make this comparison, but a change in the dairy hands would render it unfair. The rent of the land was nothing in this case as it was at my disposal without cost. That can be calculated by any one desiring it, for himself.

Middlesex Co., N. J.

MOISTURE-RETAINING POWER OF THE SOIL.

A LETTER FROM DR. E. LEWIS STURTEVANT.

I HAVE read with much interest the experimental attempt of the editor of the RURAL to settle the question whether pulverizing the surface soil checks the loss of water from the soil, and if I differ from him as to its value, it is because it seems to me that the experiments were not devised in such a manner as to give a reply to the question asked. The conditions involved in a plant pot of earth immersed in water, and those which occur in the field are vastly different.

We are sorry not to be able to give the figures of actual experiments which shall prove that pulverizing the upper soil does act to conserve the moisture in the field, because we are not entitled to their first use, and to do so would violate a confidence, but these experiments referred to, as well as our own observations upon experiments on the soil, tried for other purposes, show clearly that a loose coating of earth acts as a mulch and does conserve very largely the moisture of a field. For instance: upon a dry spot, a coating of sand was spread over a square yard or so, and a kernel of corn planted. In the summer drought, the adjoining corn plants perished, while that mulched with sand neither wilted, rolled nor showed any other indications of insufficiency of water. Again: a plot of land from which the weeds were removed by hand, as compared with an adjoining plot where the surface soil was kept lightened with the hoe to a depth of about two inches, showed noticeably less moisture of the soil through the dry season, as observed by digging holes to the subsoil. Of the crops of corn planted on these plots, the unhoed crop curled its leaves through lack of moisture, while the hoed crop did not appear to suffer. Again: of two boxes, the one filled with sand, and the water surrounding coming within several inches of the surface, the evaporation from the surface was very great, and the water was kept to within a short distance of the top. In another box of *earth*, likewise standing in the water, but with a coating of two inches of sand, the evaporation was comparatively little. Again: of two pots standing alongside on a green-house bench, the one with the surface hard, and the other with the surface pulverized, the former required more frequent watering than the latter, in order to preserve the life of the plants therein.

Again: In some experiments made to test the power of our common angleworm to convert a subsoil and a sand into loam, carried out through last winter in my study, one of the glasses used contained compact subsoil; a second glass, clear sand; and the third, ordinary loam, a half inch of vegetable matter being originally placed on the surface of each jar. The hard soil required a more frequent and abundant supply of water than did the loam and less was required for the sand.

And so I might multiply observations all tending to show that *where the water level is brought near the surface* of earth, the pulverization of the surface down to and including the water-soaked portion, *oftentimes*, shows an increase of evaporation. When, however, the pulverized surface soil is placed and kept *above* any permanent water level, then the contrary seems evident—that evaporation is checked. In general terms, as experience of the farm shows, a pulverized surface to our fields hinders the rise and loss of moisture from the deeper portions of the soil, although the loss of water is large from the surface which is itself pulverized.

In some observations on soil temperature this past summer, I found, in every trial, that the surface soil was warmer than the air, the temperature being taken early in the morning before the influence of the sun was to be felt. As dew is only deposited upon surfaces *colder* than the air, I cannot believe that, under the circumstances of culture, any moisture from the air can be deposited in our soil as dew, and that therefore this, as a source of water addition to our soil, usually, if not always, addneed as one of the effects of stirring the soil, must be abandoned from our thought. It is very true that under laboratory conditions, dry soils do absorb moisture from the surrounding air. It seems as certain that this absorption has never been determined for arable soils under farm treatment, and that, when exact experiments shall be made, it will be found that although there may be exceptional instances of an accretion of moisture by dry soils, yet that this fact will not apply to the ordinary conditions of soil and air, as met with on farms, during the season of growth in New England.

This whole subject of the physics of the soil is worthy of more full, complete and exact study, and I am very much pleased to see such an influential and advanced paper as the RURAL NEW-YORKER giving it prominence.

I must apologize for appearing in your paper with an article counter to your views, but as we are both seeking the TRUTH, I do not deem my position either as objectionable to you, or in bad taste.

(Far from it.—EDS.)

Farm Economy.

BARN-YARDS.

BY A WESTERN FARMER.

THE barn-yard is one of the most important parts of the farm, inasmuch as it is the manufactory of the manure as well as a place where the cattle spend a large portion of their existence. It should, therefore, be arranged with a view to the most perfect fulfillment of both of these purposes. It is all the better adapted for the latter purpose in proportion as it is more effective for the former, and a well-arranged barn-yard that will preserve the manure in the best manner, will be convenient and comfortable for the cattle.

THE SITUATION.

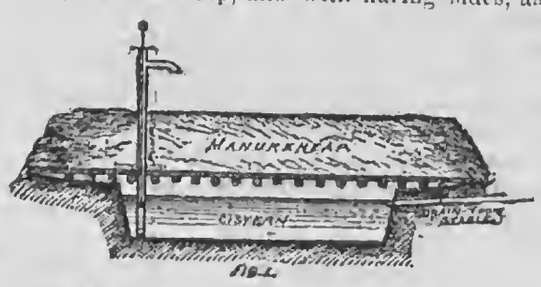
A barn-yard should never be made upon a steep slope. A slight slope to the south is desirable, but the site should be so nearly level that the rain which falls upon it may not flow off and carry the wash to lower ground where it will be wasted. The surface should be somewhat hollowed to the center to retain all the water that may fall upon it, and keep the manure or litter that may remain as moist as may be necessary to keep it in good condition. The manure and the litter of the yard should be heaped in this lowest spot in a square pile built up with perpendicular sides and hollowed at the top to retain what rain may fall upon it. When the yard is scraped up, fresh litter should be scattered over it to prevent the surface from being poached into mud. A muddy yard, or one slushy with soft manure, is unhealthful and contributes greatly to disease of the feet, lungs and udder. The troublesome affection of the hoofs and coronets, known as hoof-ail, foot-rot, etc., is caused by the wet filth of muddy and sloppy yards. Cattle take cold if compelled to lie about in such yards, and innumerable cases of pneumonia and garget are caused in this way.

THE DRAINAGE

of the yard, and stables as well, may be effected by means of a manure cistern in the center of the yard. This is a most valuable adjunct to a well-ordered farm and may be made to return its cost every year, either in a supply of liquid manure for crops that can be fertilized in that way—grass, clover and low-growing fodder crops being especially suited to it; or by furnishing the means for greatly enriching the manure heap itself. Drains from the stables and pens should be led into the cistern, and this should be covered with stout poles upon which the manure may be piled. A pump should be fixed in the cistern, by which the liquid manure can be raised and poured over the heap to moisten and enrich it, or into manure tanks for spreading it upon the field. The leaders from the roof gutters may be connected with the manure drains, so that the liquid manure may be diluted sufficiently for use, as it is far too concentrated to be safely used without being mixed with at least four or five times its bulk of water. During the fall and winter, the leaders should be disconnected from the manure drains and turned into the water cistern.

CISTERNS.

A manure cistern may be a very simple affair. All that is needed is, to excavate a hole large enough, say, twenty-four feet long by twelve wide, six feet deep, and with flaring sides, as

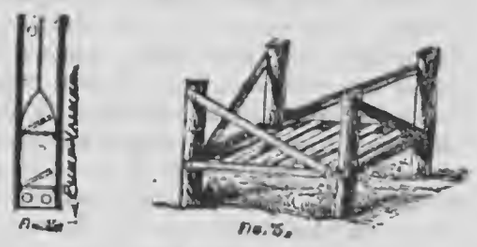


shown in section in Fig. 1. The bottom and sides are covered with a coating of cement made of one part of hydraulic lime and three parts of sharp sand, and laid directly on the earth with a common trowel. The cement should be carried over the edge on the top for a few feet, so as to make a hollow or dish-shaped receptacle to collect the drainage from the manure heap. Round poles are laid across the cistern, and rails upon these, to make a firm bed for the manure. A common wooden manure pump is fitted as shown by the dotted lines. This may consist of a wooden tube made of strips four inches wide nailed together at their edges and furnished with a spout, a lifting valve and iron rod to work it with. The valve is made, as shown at Fig. 2, of a piece of thin, hard wood, hinged by a piece of leather to an iron frame which is attached to the lifting rod. The valve opens (see dotted lines) when it is pushed down, and closes when it is drawn up; the liquid is retained in the pump by means of a check-valve, shown at the bottom in the illustration. Any handy boy can make this pump and a blacksmith can make the rod and valve-seat in an hour.

A water cistern is very handy to have in a barn yard, and will furnish a large supply of water for stock. It may be lined with cement, and for a building 50x24, should be ten feet deep and eight feet in diameter, which will hold 3,600 gallons or 120 barrels. The total quantity of water falling on the roof of a building of the size mentioned in the year, will be 25,000 gallons or over 800 barrels, giving more than two barrels a day through the year. A cistern of this size will easily be filled in a week of rainy weather, in spring or fall, and a heavy thunder-shower (two inches of rain-fall) would fill a third of it.

FEED RACKS.

No barn-yard is complete without feed racks. These are means of saving fodder and preserving cattle from injury caused by fighting over their feed. There are many simple methods of making them. One is by nailing fence strips to posts, as shown at Fig. 3. By this means a



rack for four cows is made. A sufficient number of these may be provided for all the stock, and one or two in excess may be useful. A long rack at which twelve to twenty cows may feed, may be made by setting fence posts in the ground and fitting two strong rails into them, as in a post-and-rail fence; cross laths rest upon the lower rail, and the upper one serves to keep the fodder in the rack. A rack of this kind for twenty head should be three panels, or thirty feet long, and four feet wide. This will give ample room to fit stakes and posts to the rack at intervals of three feet, so as to make species of stalls in which the cows can feed and which will prevent them from crowding each other. Similar, but smaller racks should be provided for sheep.

WATER TROUGHS

are as needful as feed troughs, for a constant supply of pure water is indispensable to health and profit from the stock, of whatever kind it may be. Troughs for winter use should be made to be reversed, so that at night they may be turned over and kept free from snow. One

constructed as shown at Fig. 4, would answer the purpose, and at night might be turned over, emptied and held with the side uppermost by means of the peg near the top of the post inserted in the hole at the corner of the trough.

CRACKS IN BARNS.

There seems to be an idea that these necessary evils on a farm should be winked at, and not spoken of too often. Some barns are nearly all cracks, especially on the outside between the boards. Now these cracks are a very important and very necessary part of all barns. There must be cracks, and they won't be *stopped* up, but they can be *backed* up and this is the way to do it: Mix together "*secundum artem*" in proportion to suit your circumstances, good seed, good soil, good tilth, good after care, and thus produce crops which shall be the "crack" crops of the country. When harvested, haul to the barn, and every farmer will not only stop up the barn cracks, but many little cracks in other folks' premises, such as the storekeeper's, the blacksmith's, the tailor's, the shoemaker's etc. It is astonishing how fast a neighborhood will improve when this mode of getting rid of the RURAL's bug-bear is adopted by the people who have barns.

The RURAL doesn't like people to tell it so much about stopping up the cracks, but is there anyone who has backed up these "airy nothings" as effectually as this same RURAL NEW-YORKER has done, especially during the past year? Let an Irish echo answer "Few, if any," through a crack, and let it be a big one!

S. RUFUS MASON.

Field Crops.

FORAGE PLANTS IN KANSAS.

L. J. TEMPLIN.

ASPECT OF THE COUNTRY.

KANSAS occupies a part of the region marked in the geographies of a few years ago as "The Great American Desert." This region, including Nebraska, Colorado, and Wyoming Territory, is now the home of nearly two millions of enterprising people. The success already achieved in grain and fruit-raising proves this part of the country capable of competing with any portion of the Union in diversified agriculture. But while this is true, it is a fact that admits of no question that the raising of live-stock is to be the great source of wealth to the people of this State. This is equivalent to saying that the forage crops are the most important ones to the prosperity of the State. From the Missouri River to the mountains, this whole region is one vast extent of native pasture. It seems strange to us that these rich plains should ever have been regarded as a desert; but it seems that a marked change has taken place in the appearance of the face of the country within the lifetime of the past and passing generations. Old teamsters and explorers tell us that fifteen years ago the sand-hills that stretch parallel to the Arkansas River, were entirely destitute of vegetation, whereas they are now almost entirely covered with nutritious grasses, making excellent sheep walks and cow pastures. The nutritious character of the native grasses of this region needs no other proof than the readiness with which they fatten stock for the market, even keeping cattle and sheep in good living order all the year round. There is a great assortment of wild grasses found on these plains, extending from the Rocky Mountains to the Missouri River. A knowledge of these grasses is of importance both to the settlers of these plains and also to all whose well-being is in any way affected by the live-stock products of this region.

SPECIES OF GRASSES.

There are in this part of the country 143 species of grass, belonging to five genera. Of these ninety-one are also found beyond the Missouri River, many of them growing all the way East to the Atlantic. Of these, however, seven belong, strictly speaking, to the plains, extending only a short distance beyond the river, while fifty-two are confined to the plains exclusively. Thus, of the whole number, eighty-four kinds belong equally to the East and West, while fifty-nine belong to the West.

Most of these grasses are worthless, or nearly so, as forage plants, and might be dispensed with, with little or no loss to the grazier and feeder. For eastern and central Kansas, one half dozen will include all that are of any special importance to the stock-raiser, while along the ascent of the eastern slope of the mountains, the list would have to be extended to perhaps a dozen. The relative value of the five most important to this region, may be set down about as follows: Andropogon furcatus, 40 per cent.; Andropogon scoparius, 20; Sorghum nutans, 20; Sporobolus heterolepsis, 12; Buchloe dactyloides, 5. The remaining 3 per cent. would be divided between several different species. This comparison of values is necessarily only an approximation, and may not be sustained when the matter is fully submitted to chemical analyses and experimental tests; but it is believed to be not far from correct. The Andropogons, which comprise more than one-half of our valuable grasses, are perennial, with rigid culms, and clustered or digitate spikes. The first-named above, Andropogon furcatus—

"BLUE STEM,"

is most abundant, and is distinguished from the two that follow it only by its spikes of flowers and fruit. It has a smooth, terete branching culm, with digitate spikes. It grows from five to seven feet high. It produces a large mass of radical leaves from eight to twelve or more inches long. These cover the ground so completely as to exclude many of the worthless weeds that abound in other places. Some seasons it produces seed quite sparingly. It seems to require a moist situation, or a wet season to induce it to seed profusely. It is an excellent grass for hay, especially if cut before the stems become hard and woody.

BROOM GRASS,

A. scoparius, is a much smaller grass than the foregoing, growing only three to four feet in hight. It is also much less abundant, and seems much less inclined to send up flower stalks than that grass; but in its radical leaves it very closely resembles the other, being, indeed, often mingled with it on the prairie. As a hay grass, it is probably of equal value, ton per ton, with the Andropogon furcatus. Dr. Darlington, in his "Weeds and Plants," declares these two species to be "remarkably worthless grass." However true this may be in regard to the worn-out and neglected fields of Pennsylvania, on the rich soils of Kansas they are exceedingly nutritious and valuable, constituting, according to the above estimate, sixty per cent of the valuable grasses of this part of the country, and producing enough rich herbage to feed and fatten millions of cattle each year within the limits of this single State. Sorghum nutans—

WOOD-GRASS,

is a noble grass, resembling the two preceding species, and distinguished from them only by its seed stalk. It has an open panicle that has a drooping tendency when ripe. It has often a glaucous color that contrasts finely with grasses of a pale or colorless hue. It resembles the others in not seeding very abundantly, except in favorable seasons and situations. It is injuriously affected by dry weather, the quantity of hay it will produce being greatly reduced by drought.

These three grasses, as shown above, are supposed to constitute eighty per cent. of the valuable hay and pasture grasses of these regions. When left standing, they generally dry up into natural hay before severe frosts, making a very nutritious feed that seems to be relished by stock almost as much as that which has been cut and put into stacks. If the fall and winter are dry, as is usually the case, this natural hay seems to retain its good qualities till the following spring. Stock will often live through the winter, in fair condition, with no feed except this dry grass on the range.

The next to be noticed is Sporobolus heterolepsis. This, with many other specimens, is called

"DROP-SEED GRASS."

It produces a heavy growth of long, slender leaves from the crown of the roots. These have a peculiar curled form, the points often resting on the ground. It is more inclined to grow in stools or bunches than either of those named above. It has a small panicle composed of sharp-pointed spikelets. The round seeds, when bruised, emit a strong, disagreeable odor. This grass, when it seeds, grows about two and a half feet tall, but in a dry season it seldom sends up any fruiting stems at all. It seldom yields any large amount of hay, but what it yields is of a very superior quality.

I come now to speak of a grass of which almost everybody in the country has heard, but of which I find many have formed very erroneous ideas. This is the

BUFFALO GRASS,

Buchloe dactyloides. It is entirely unfit for hay, as will be seen from the description. The leaf-growth seldom exceeds three inches in hight, while the scattering male flower stalks grow to about twice this hight. The seeds are borne near the surface of the ground, under the foliage. Both pistillate and staminate flowers are produced by the same plant. Though so short it forms a very close, thick sward, and furnishes a large amount of very nutritious herbage. It endures an almost unlimited amount of grazing, and seems to thrive better under such treatment than when left undisturbed. It is said to be found 100 miles west of the east line of Kansas and west of that range. In this part of the State it is generally found in limited patches, but old settlers state that when the buffaloes were here in great numbers it was the prevailing grass, but since their disappearance the larger grasses have come in and displaced it over most of the country. In places where it still retains its hold, the subsoil is generally found to be composed of hard-pan, which seems to be in the incipient stage of the process of turning to stone. On account of its impermeable character the water stands near the surface after a heavy rain; and it also dries out worse during a

drought than the surrounding soil. These facts probably account for the continued existence of this grass in these isolated spots.

There are many other species of grass that are found in greater or less abundance throughout these regions, many of which contribute to the sustenance of stock in the form of both hay and pasture; but the ones named, both on account of their quantity and the quality, are so predominant that the subject may be considered fairly treated without entering into a detailed description of the remaining ones. There is no question about the abundant supply of grasses to meet all probable demands for many years to come, provided the present supply can be kept up; but it is very questionable whether this can be done where the land is heavily stocked with animals. These native grasses seem to be quite easily killed out by close grazing and tramping, and their places are speedily occupied by worthless and noxious weeds. It is a question of vital importance to the prosperity of this country to know what success can be had in the cultivation of the tame grasses and clover. The discussion of this question would extend this article to an undue length, and so must be deferred.

Reno, Co., Kansas.

A CORN CROP.

On the 14th of May, 1875, on a piece of ground which had never been manured, I planted a variety of corn from Tennessee. It was a White Dent Corn. I made 120 hills, four feet apart each way, putting three grains to a hill. Every seed grew, ran up very tall, bore from two to nine ears to a stalk, averaging four, having from eight to twelve rows each.

The patch was shovel-plowed twice, a shovelful of hen-house manure (one-third manure to two-thirds common soil, mixed) put upon each hill, and afterward hand-hoed twice. The corn was husked Oct. 12, yielded 3.41 bushels of ears counting three half bushels to the bushel. From this I selected two-thirds of a bushel of twelve-rowed ears for future seed, and discarded the rest.

It will be seen that the corn received but common care, and but little manure, and yet it produced at the rate of 77.4 bushels per acre, all sound corn, there not being a nubbin in it. The season was quite wet, too wet for small grain, but just right for corn on upland, like the land on which this grew. The ears were medium in size, but very even. I hope by careful selection, to increase the yield of this corn to 100 or more bushels per acre, without any fancy cultivation. I think few of the great corn crops of this season can excel this, considering all the circumstances. S. R. M.

Dodge County, Neb.

RAISING POTATOES IN A GREEN-HOUSE.—With regard to a short article on this subject in RURAL for December 14, a correspondent writes us: "Mr. Peter Henderson, in his reply to the query of 'W. W. K.,' of Toronto: 'Would it be possible to plant the 'Beauty of Hebron' potato now, in a bed in the green-house, so as to have the product for planting in spring?' remarks somewhat to this effect: The tubers, being cut lengthwise, so as to expose as many eyes as possible, should, after drying, be planted in small pots, and then placed in the green-house not sooner than March 15th. When the shoots are about two inches long they should be removed, and then propagated. He concludes by saying: 'Every plant of these, if properly handled, is equal to a dry 'set.'" With all his remarks do I agree except this last. It is true that these plants, if properly handled, will produce other potatoes; but he is in error in supposing that these tubers will be as good as those grown in the natural way. This is not a new experiment; but when produced in this manner, it will be found that such tubers are exceedingly liable to rot, and consequently not desirable for keeping purposes; nor are they suitable for replanting, as they are weak, and the bulk of their product are certain to rot. X.

THE MOST PROLIFIC VARIETY OF CORN.—Apropos of our Editorial Brevity on this subject on page 748, a correspondent writes us from Burr Oak, St. Joseph Co., Mich., to the effect that the variety of corn which has averaged the best yield with him for the past thirty years, is the White Dent or the White Gourd-seed. It ears large; frequently has to each ear 1,200 kernels of great length, and sometimes as many as 1,800. It was introduced into this county about 1842, and down to to-day has not been generally grown by farmers thereabouts. He doubts whether it would thrive in Pennsylvania, New York, or the States to the north-east of them.

We know of a wealthy farmer but a short distance from our farm that up to a few years ago failed to get good crops though manure was literally piled upon the land regardless of expense. Lime was suggested and used in large quantities and the best crops ever known on that farm have since been raised. "The more dung the more lime," and the converse is equally true.

The Herdsman.

THE EXHIBITION OF FAT STOCK AT CHICAGO.

AN exhibition of fat cattle was held at Chicago recently to which our crowded columns have prevented us from alluding. This show is something novel and of much interest. We have had many exhibitions of fine cattle whose fancy points, rather than their merit in the butcher's eyes were their chief claims to excellence. In this exhibition intrinsic value as to beef was the object most desired, and the result of the competition cannot fail to be of great importance. American beef has been considered as of inferior excellence to what has been more poetically than truthfully called the grand, unsurpassed "roast beef of Old England." English beef has long been supposed to be the best in the world, and it has been thought that no other beef could ever come into successful competition with it. The results of the Chicago Exhibition go to show that we can produce as good beef and of as early maturity as our British competitors ever showed at their Smithfield butchers' shows. The cattle exhibited at Chicago consisted of Short-horns, Herefords, Devons and their grades. The premiums awarded were as follows:

SHORT-HORN COWS.

	Age.	Weights.	Gain per d y.
1st	1,721 days.	2,075 lbs.	1.20 lb.
2d	1,188 "	1,285 "	1.08 "

HEREFORD STEERS, 4 years old.

1st	2,692 days.	2,010 lbs.	.75 lb.

HEREFORD STEERS, 3 years old

1st	1,336 days.	1,705 lbs.	1.20 lb.
2d	1,356 "	1,760 "	1.29 "

HEREFORD STEERS, 2 years old.

1st	1,080 days.	1,470 lbs.	1.36 lb.

DEVON STEERS, 3 years old.

1st	1,371 days.	1,655 lbs.	1.20 lb.
2d	1,267 "	1,475 "	1.16 "

DEVON STEERS, 4 years old.

1st	1,658 days.	1,645 lbs.	.98 lb.
2d	1,652 "	1,870 "	1.13 "

GRADES AND CROSSED STEERS, 4 years old.

1st	2,058 days.	2,750 lbs.	1.69 lb.
2d	2,033 "	2,833 "	1.79 "

GRADE STEERS, 3 years old.

1st	1,307 days.	2,185 lbs.	1.[illegible] lb.
2d	1,277 "	2,205 "	1.[illegible] "

GRADE STEERS, 2 years old.

1st	958 days.	1,885 lbs.	1.96 lb.
2d	958 "	1,560 "	1.[illegible] "

GRADE STEERS, 1 year old.

1st	596 days.	1,420 lbs.	2.38 lb.
2d	641 "	1,520 "	2.37 "

SWEEPSTAKES. Steers.

1st	1,902 days.	2,440 lbs.	1.28 lb.
2d	1,307 "	2,185 "	1.66 "
3d	957 "	1,640 "	1.71 "
4th	650 "	1,480 "	2.27 "

Cows, 3 years and over.

1st..... A Hereford cow.

The above list deserves some notice. It should be stated that no first premiums for grade animals were secured by any but Short-horn crosses, although a Hereford steer came near to capture a premium in the sweepstakes. It will be observed that young beef is the most profitable because an average growth of more than 2¼ pounds per day may be made within two years. Beef older than two years does not pay so well, because the increase in weight is out of proportion to the necessary increase in food. The rapid maturity of Short-horn or grade Short-horn steers has totally changed the old system of feeding, and it no longer pays to feed until three or four years old, because the former average weights of that age can now be gained in half the time. It may be that the quality of the meat may suffer, but the profit of the feeder is everything and the consumer must take what he can get and be content. There is, however, little to grumble about in the quality of a well fed two-year-old of 1400 or 1500 pounds. This fact may well be considered by those who have not yet introduced the improved breeds into their herds, and are still throwing away feed in the endeavor to grow beef fit for market in four or five years.

FAT-STOCK EXHIBITION AT BIRMINGHAM, ENGLAND.

JOHN HILL.

THE 30th exhibition of fat stock, poultry, agricultural seeds and implements was held at Bingley Hall, as usual, Nov. 30th and Dec. 2d, 3d, 4th and 5th. Although, of course, there were some good specimens in each class, the collection was not as good as it has been on other occasions. The new rule which has been made by the Smithfield Club, which excludes any beasts that have been shown at Birmingham from being exhibited there, for fear of spreading disease, in a great measure tends to spoil both shows, many of the best animals in the present case having been kept for the Smithfield exhibition next week.

HEREFORDS.

Taking the classes as they are arranged in the catalogue, first come the Herefords, which as a lot are decidedly not so good as usual, a few entries excepted. There is to be a large show of these cattle in London, and the best, no doubt, are reserved for it. The ox that wins the first prize in his class for those over four years old is a grand, massive animal with a girth of 9 feet 10 inches; his live weight is 2,520 pounds. The first-prize beast in the steer class not exceeding four years old has wonderfully heavy flesh, with grand Hereford character, on short legs and beef to the ground. He has won 12 first prizes previous to this exhibition. At three years eight months old he weighs 2,114 pounds and girths 9 feet 1 inch. This animal takes the £100 prize for the best Hereford in the yard. The only other beast of this breed that deserves special notice is the beautiful heifer "Beatrice," three years three months old. She has been one of the great features in the leading shows ever since she came out as a calf, and it is a pity her life is now to be ended in the butcher's shop; but this, unfortunately, happens to many of our young show heifers. She often has been exhibited as a pair with the still more celebrated heifer "Leonora," so often the champion female of all breeds, beating the crack Short-horns and others. Fortunately she is breeding, and no doubt will produce offsprings worthy of their dam. "Beatrice" weighs, alive, 1,922 pounds. She is wonderful in the chine, back and loin, with an extraordinary rib and forepart, but rather fails in her flank.

SHORT-HORNS.

There were four entries for Short-horn oxen exceeding four years old. The first prize was taken by a very fine well-bred beast, full of quality, carrying a great weight of good flesh, with fine character. He was expected to have won the champion honors of the yard, but in this he was defeated by the cross-bred ox of which I shall speak presently; his live weight is 2,974 pounds at the age of five years five months. America is well represented in this class by the second-prize ox, bred by Mr. C. P. Bedford, Paris, Ky., and exhibited by Messrs. John Bell & Sons of Glasgow, Liverpool and London. I learn that he had been in this country six weeks, and he certainly is a good specimen of a well-fed Short-horn, and shows far more good breeding and quality than the other American ox exhibited in the class for animals not eligible to any of the other classes. The latter is a large, coarse beast, rough in his shoulders and tight in flank and thighs, and not quite fat enough for an exhibition of this sort. He is four years old and shows a good deal of the Short-horn type. He is exhibited by the same firm. The weight of the second-prize beast just mentioned is 2,110 pounds at four years six months old and the other beast weighs 2,114 pounds. The most level and evenly fed bullock in the Short-horn classes is the first-prize animal exhibited by Mr. A. Darley of Little Ness, Shrewsbury. He weighs 1,953 pounds at two years six months old.

There are a large number of Short-horn cows entered. The first and second honors were won by Walter Cottrell, Thame, Oxford, and Mr. R. Stratton of the Duffryn, Newport, Monmouthshire, respectively. Both the winners were of great merit; but the most striking cow in this class, showing beautiful Short-horn character, of excellent quality, with splendid head and carriage, a beautiful handler, covered with capital hair, with a back and thigh and loin nearly perfect, but rather light in her forepart and thin on her chine (no doubt partly accounted for by her age and what she has done, combined with the great milking properties of the herd she comes from), is the animal exhibited by Mr. John Allan Rolls of the Henkre, Monmouthshire. The judges highly commended her, and as she has not long been feeding, is ten years old, and has reared six calves, it is a very respectable situation to have obtained. She was much admired by all Short-horn breeders, as she is a good specimen of the herd to which the great "Duchess" breeders are beginning to look with interest, tracing back as they do in a direct line to the celebrated "Dairy" bull, and it is believed by many that the old "Dairy" tribe will turn out to be the one to which the breeders of the "Duchess" cattle must look for a cross. It is quite certain they are now at their wits' end where to go, and at all events such a cross is well worth their serious attention, the two tribes being so nearly descended from the same source. Mr. Thornton, the Short-horn auctioneer, has advertised a few of these "Dairy" cattle to be sold by order of Mr. Rolls on the 28th of March, 1879.

The special £100 prize for the best Short-horn in the yard is won by a beautifully fed white heifer bred and fed by Mr. Hubbard Sound, Lowesloft, Suffolk. At three years five months old she weighs 1,953 pounds, being two weeks older than the Hereford heifer, she weighs 31 pounds the heavier. This is another example of how nearly the two breeds agree in weight for age.

OTHER BREEDS AND CROSSES.

The Devons were fairly represented, as also were the Long-horns, but they need no special comment. The Scotch cattle were very fine, but not so remarkably fine as I have sometimes seen them. The cross-bred animals were not good, excepting the magnificent bullock that won the first prize of £50 in his class.

The Elkington challenge cup, value 100 guineas, and silver cup, value 100 guineas, given by Messrs. Jones, Gibbs & Co., as the best animal in the yard. This ox is black, being a cross between a Short-horn bull and a polled cow. He takes rather more than is usual in such cases after the dam, but is horned. He is wonderfully well fed and is square and meets you well with great forehead, foreflank, and rib, perhaps a trifle slack behind his shoulders and low in his back, but he has rare loins and great thighs, and altogether is an enormous mass of firm well-laid-on beef. He weighs at four years ten months old 2,816 pounds, and before he left his Scottish home he weighed 3,024 pounds, losing the difference on the journey, I suppose from not eating so well when traveling and having been weighed when empty at the entrance of the show yard.

Among the cows or heifers of any age not eligible for any of the other classes, there are always some beautiful specimens; young animals that have been in constant show condition and which have failed to breed. The Rev. R. Bruce Kennard of Marnhall, Blandford, wins with a splendid heifer "Isle" which ran the champion ox very hard for the chief honors of the yard, and some good judges even went so far as to say she ought to have had them. She certainly is better in her back, and is the most level and perfectly made animal for her size I have ever seen. She is square and thick on short legs, has extraordinary hind quarters, a capital top and wide in her chine. She has a beautiful coat and handles to perfection. She is really a "gem" and worthy of the grand herd she comes from. The second-prize animal, bred and fed by the Rev. Walter Sneyd of Keele Hall, Newcastle, Staffordshire, is a charming heifer and would have won in less high company.

Miscellaneous.

ROAD-SIDE ORNAMENTATION.

W. I. CHAMBERLAIN.

Difficulties in the Way.

Country road-sides are usually unsightly and unprofitable. They are often a refuge for stones, weeds and briers, or a tramping ground for teams in muddy weather. Under most of our State laws a "supervisor" or "path-master" is chosen for each road district, by vote, each spring. The position is no sinecure. It brings no pay except for labor, and is therefore often taken in rotation by all the farmers in a district, and so all sorts of men hold the office. But the supervisor is "monarch of all he surveys." He can order out the property-holders to work on the road when and where he will. He can run the ditches straight or crooked. He can cruelly plow into your nice turf in front of your very house-lawn, if he chooses. "His right there is none to dispute." Add to this the fact that in spring and fall, when roads are muddy, every man that rides or drives on the road is also an autocrat, and can poach up your turf the whole length of your farm, if he will, and it is plain that road-side ornamentation in the country is not an easy thing, even if one sets about it. Formerly, too, cows and hogs roamed the streets, but now that nuisance is almost everywhere abated. People began to see that since each farmer pays for all highways running through or past his farm the same price per acre as for the rest of his farm, and pays yearly taxes on them, too, his neighbors plainly have no right to use *his road-sides for their hog yard or cow pasture.* The public have a right to the proper and necessary use of them for travel, and nothing more. All else belongs to the land-owner. It logically follows that the latter has the right to improve and ornament his road-sides, and reap all benefits arising from such improvement; also, that the supervisors and the traveling public have no right to hinder his doing so. But how shall we prevent their ruining our roadsides by driving on them in wet times? Some throw down rails and chunks, but the irate and independent public will jump out of their wagons and throw the rails aside with a jerk and an oath.

TREES THE BEST ORNAMENTS.

I know but one effective way, and that is to do what should be done anyway, viz.: set a row of shade trees on each side of the road, about six feet from each fence, and double-stake and guard them while young. The laws in most States give the right to plant and protect thus. The trees will not only be a great ornament and blessing themselves, but will make it possible to have a lawn-like strip of grass, uncut by wheels and hoofs, all along the roadsides. Most of our country roads are about 60 feet wide. If, now, we allow 32 feet for the turnpike, or roadway and ditches, there remains room for a nice grass plot, 14 feet wide, on each side. But with a row of trees, well guarded by stakes, running nearly through the middle of each, it will be impossible for wagons to drive there. And with care, a nice, straight, smooth strip of grass may be had,

which can be mowed twice a year by the farmer with good returns in cash, and in improved appearance.

MOST SUITABLE SORTS.

What trees shall we plant? The Sugar Maple is my own favorite, and I have lately set about 200, making a double row more than half a mile long. The trees are clean and beautiful, and in time this double row along the roadside may be made a part of the sugar orchard, and yield many gallons of the purest, most delicious sweet produced by nature and art combined. The Elm is the most magnificent shade tree, but is a voracious feeder, and will in time draw heavily on the fertility of the adjoining fields. Its roots are of enormous length, and its branches spread far and wide, and will shade the adjacent crops in time. But it is hardy and requires less care than the Maple. Some varieties of the Cherry make good shade trees, and the boys do not object to the fruit. And even the apple tree is used in some parts of New England. A well shaped Baldwin is a handsome shade tree, and the apples will feed the boys and leave a large surplus to the farmer.

But it is not enough simply to plant the trees. The soil must be properly prepared beforehand, and the trees will need much subsequent care and shaping. The soil of some of our clayey road-sides is nearly ruined by travel in muddy weather, and must be restored to mellowness and fertility. In case of the Maples mentioned above, the ground was plowed, manured and cultivated for two years before the trees were set—just as for a young orchard, and it will be cultivated a few years in low crops or without crops, and then seeded to grass and the trees mulched. Some such treatment seems necessary to secure the life and rapid growth of Maples on a clay road-side. Tilling the ground, too, will keep horseback riders off. A plowed field is worse than the road, in muddy weather.

Such improvements add much to the cash value of the farm, and give returns enough each year in cash, if managed rightly, to pay for the labor.

Summit Co., Ohio.

THE HISTORY OF A POOR FARM. NO. 1.

It was certainly a poor farm, and as I inspected my new and accidental possession, I thought of Touchstone's remark about Audrey, "an ill-favored thing, sir, but mine own." It was something that would be costly to let alone and costly to do anything with; but as the latter was the only way to make it worth something in the end, I began to consider what should be done. The land was a sandy loam, a flat ridge with a swamp on each side, and rather steep hill-sides from the ridge to the swamps, a piece of wood-land of a few acres, and a more prepossessing field beyond the wood. The fences either lay down, or tottered in all angles but right-angles, and the rails were moss-covered and in a venerable condition of weakness, which made it unsafe to rest upon any of them. The fields were covered with wild garlic, sand burs, and rag-weed: the buildings were in a wretched condition of decrepitude and, for some years, no animal had put foot upon the premises to stay. The whole 60 acres could not have furnished one fair meal for a cow, and a flock of sheep, notwithstanding their supposed aptitude for, and success in, restoring poor fields to a condition of fertility, would have starved before they could have found a place to begin operations in.

It was over such a prospect that I was dubiously considering how hopeless was the task before me of bringing this farm into a profitable condition, and more particularly viewing a rough swamp of several acres lying in a sort of basin at my feet, when an old gentleman approached me very deliberately and said, "You are the owner of this place, I suppose?" Without waiting for an answer, he continued, "I thought so." Perhaps he saw the fact confessed in my assenting look. "You've a mighty poor piece of land here; that is, it's in a mighty poor condition—the land is good enough in itself, but it has been run down wonderful. And the question is how are you going to get it up again?" "Well," I remarked, "there's that swamp; don't you think that will help towards it?" "Yes," replied the old gentleman, "there is enough land there, if it was only put into good condition, to cut 30 tons of hay every year, and enough manure may be taken out of the drains to make the rest of the farm rich. I have lived more than 60 years on the next farm, and I know that the muck out of these swamps is worth, load for load, as much as cow manure, and that is just what this light soil wants." "I think you are right," I replied, "and no doubt a farmer who has a bed of swamp muck on his farm, is well supplied with manure, if he only manages it properly." "How would you use it?" asked he. "Well I have had some experience with swamps before this, and have used large quantities of swamp muck. I have spread it raw upon the ground and plowed it under, but in that way never found it of the least use. I have dug it and mixed it with lime and made a compost of it, and in that shape it is valuable, especially for top-dressing meadows and for plowing under. But the best method of using it is undoubtedly to haul it to the yard and bed cows, horses and pigs with it, very liberally, and so save all the liquid manure that would otherwise be wasted; and that is what I propose to do with it here."

THE PLANTATION MILL.

"What does this muck consist of?" asked the old gentleman. "I guess it's mostly rotten leaves and grass, and I don't see why it is not as good as they are. Gardeners think very highly of leaf-mold, I always thought." "That is true," said I, "muck that is free from sand, as this is, contains about three per cent of nitrogen; and one ton of it, dry, would be equal in value, in this respect, to seven tons of straw. A ton of good dry muck would contain 60 pounds of nitrogen, or as much as six tons of horse manure or ten tons of cow manure, in the wet state in which these are generally used. And there is no need to draw 1,500 or 1,600 pounds of water with every load of muck, if it is dug and left to dry for a few months, or even weeks." The old gentleman was too astonished to reply; so I continued, "If this dry muck is spread a foot deep in the pig pens or cow stables, every drop of the urine will be saved, and this, in one year, from one cow, amounts to 7,000 lbs., in which there is more than 150 pounds of nitrogen, besides 50 pounds of potash and 5 pounds of phosphoric acid. From 10 cows there might be saved 35 tons of this valuable manure, which would make, with sufficient swamp muck added to absorb it, at least 300 loads which would be worth more than any common barnyard manure ever made." "Then," said the old gentleman, "I don't see what you want more than a lot of cows, and to set a horse and wagon to work hauling muck, to make your farm rich." "There is some truth in that," I replied, "but what is wanted in this case is some way in which I can grow something to feed the cows first; and this must be something which must not require a large outlay of money.

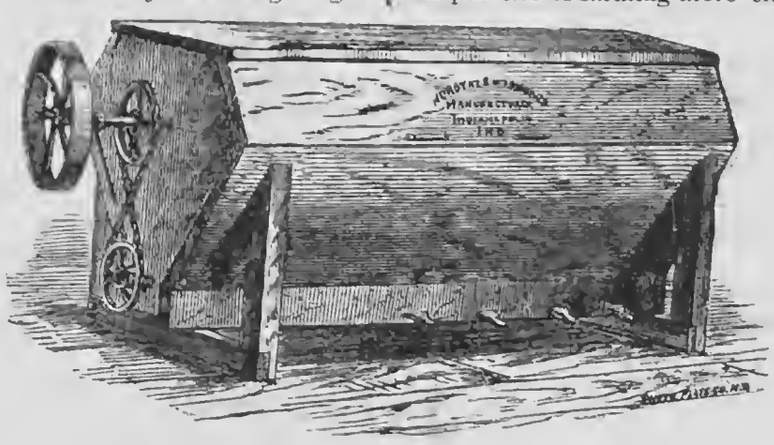
"The most difficult thing in the improvement of a poor farm is the start. This needs an outlay of money to purchase the fertilizers needed to grow the first crop. Just now artificial fertilizers promise to be of the greatest use for such a purpose, and the question of what should be used and how it should be used, is one that requires serious consideration. The points to consider are what crops would be the best to raise upon a poor, worn-out soil; and this involves the consideration of what stock are to be kept, and how they should be fed; and next, what fertilizers are the best to be used for those crops."

My plan was to feed as many cows as possible; to grow fodder crops only; and to purchase whatever concentrated food, such as bran, oil-cakes, wheat or rye middlings might be needed, with the idea that the principal value of these would be returned in the manure. In this way I should procure some rich manure, to which I could add as many times its bulk of swamp muck as possible, and so make a large quantity of fertilizing material, and in this secure my profit. My plan, also, included the growing of crops for the soiling of cows, and to sell only milk from the farm for which I could get a market at the door. From former experience I had learned to give a good deal of weight to the opinions of the neighbors who were native and to the manner born, and I was glad of every opportunity of conversing with them, and of learning their views; a man of ordinary common sense who has followed the plow all his life and has reached a good old age upon a farm, cannot fail to have gathered a large store of practical knowledge. Many a new-comer into a locality thinks himself able to teach the old residents a good many things; but it is generally the case that he finds he has many things to learn before he gets through the first year or two in his new home.

My old neighbor had left with kindly good wishes for my success, and pleased that there was a prospect of the farm, which had been badly mismanaged for years, becoming some thing of a credit to the neighborhood. He was a hale, hearty old man of 86 years, and had lived on the adjoining property for 60 years, starting as a farmer at the age of 26. He had been a tailor, but the sedentary business was not healthful, and on this account was changed for a farm. His grandson now worked the farm, and his house was filled with a number of great-grand-children; a striking instance to my mind of the happy effects upon a man and his circumstances of a healthful, active employment, and of the certain success of farming as a business when it is steadily pursued.

WHAT OTHERS SAY.

SCIENCE AND PRACTICE OF FARMING.—Professor Tanner says: "Take vegetable physiology: the man who understands the structure of plants is far better able to judge of any difficulty which arises in the cultivation of the crop than if he had not that knowledge. I do not say that a man who understands vegetable physiology is going to tell more about any failure in a crop or difficulty in its growth than the farmer of experience; but of two farmers having equal experience, the farmer who had a knowledge of vegetable physiology would give a clearer insight either into his difficulties or his means of success. The experience of the farmer is of priceless value, but if you supplement that experience by a knowledge of the character, habits, and nature of the thing you are dealing with, you must necessarily be in a better position to judge as to what causes your failure or helps you to success than if you had only one knowledge. The same applies to other branches of science. The view I wish to submit is that science must be regarded as a light thrown upon the experience which all derive from every-day practice on the farm. The study, even of pure science is likely then to be of advantage to all who are able to learn farming, because it will enable them to learn the practice of farming more clearly and more distinctly. But we must not think it is chemistry which will teach us farming. Farming is a direct matter of business in its every-day details, and is not to be learnt by science classes. But what science can do is to enable those who have learned it, to become more perfect agriculturists, and to grapple with difficulties which perhaps puzzle the man who has not this advantage. Therefore, it is of tremendous advantage to the younger men who have all their life before them.



BOLTER.

USE OF LIME.—Prof. Caldwell reasons in this way in the N. Y. Tribune: "Hence the first and one of the most important rules to be observed in the use of lime is that it should be applied in these large doses only to soils comparatively rich in humus, or strong clay soils rich in finely divided silicates. It has been proved by experiment that lime will convert plant food from insoluble to soluble forms in either case. We find the proverb current in France and Germany, as well as in our own language, that "Lime without manure makes the father rich but the children poor;" which means, plainly enough, that not only should we start with a good soil in using lime, but should maintain its good condition by the liberal use of manure; and we find that whenever, in this country or elsewhere, lime is used intelligently, manure is used freely."

CORN CULTURE.—"The suckers," says H. M. Engle, in a prize essay, "should, under all circumstances, be taken off before they appropriate too much substance which the main stalks should receive, but under no circumstances allow suckers to tassel, for whatever pains may be taken to bring or keep the corn at its greatest perfection by selection of seed, the pollen from the sucker may undo what has been gained by years of careful selection. I would as soon think of breeding from a scrub male to a thoroughbred animal, as to have the pollen from suckers cast upon an excellent variety of corn. It is also well known that the pollen from a neighboring field is ofttimes carried to an almost incredible distance, and consequently may cause more mixture than is desirable."

CATALOGUES, &c., RECEIVED.

NEW JERSEY STATE HORT. SOCIETY. The Fourth Annual Meeting of the above society will be held in Geological Hall, New Brunswick, N. J., January 15 and 16, at 10 o'clock, A. M., with an evening session on the first day. A number of topics of general interest are presented for consideration. Samples of fruits, flowers, etc., are solicited. E. Williams, Sec'y.

LIST of Clydesdale Horses at Lakeside Stock Farm, Syracuse, N. Y., the property of the enterprising firm of Smith & Powell. This handsome catalogue of 34 pages should be sent for by all desirous of improving their draft horses by the introduction of good blood, for which the Clydesdales have everywhere won an enviable celebrity.

ALSO, a 65-page catalogue of the twenty Hambletonian stallions and colts, and the forty Hambletonian mares and fillies belonging to the same firm and kept at the same place. To those interested in roadsters and light draft horses this list is both interesting and instructive.

ALSO, catalogues of Holstein cattle, to be seen on the same farm and bought from the same owners. The above catalogues will be sent free to applicants.

GARDEN MANUAL and Catalogue of Seeds, Plants, etc. J. B. Root, 802 Kishwankee St., Rockford, Ills. We would especially commend this catalogue and this establishment to the market and farm gardener, and to all especially interested in raising good vegetables.

Industrial Implements.

THE PLANTATION MILL,

shown in our engraving, is adapted to any kind of light power, and is a most serviceable piece of machinery for farm and plantation work. It will grind wheat, middlings or minerals, and will reduce meal to any required fineness. It develops great capacity by a small expenditure of power, because the grinding surface is small. The bed-stone oscillates upon a central point of contact, the spindle of runner-stone resting upon permanent bearings seated in an iron frame. This arrangement keeps the stones in face with each other.

As may be seen (see illustration) the construction is simple, solid and durable, and the stones are very accessible for dressing. The motion is said to be very steady and easily regulated. The buhr-stone is carefully selected, of sharp, even texture, medium, open or close, as desired. The Nordyke and Marmon Co., of Indianapolis, Ind., have given especial care to improving this mill, until now it satisfactorily meets the demands of their trade. The illustration of bolter shown is adapted to meal, buckwheat or flour. Its price is so low that it is possible for every one to add this machine to his mill equipment, and have a complete grinding mill.

This firm is one of the largest manufacturers of mill machinery, and extremely careful to turn out only very superior work. We would suggest that those interested should send for descriptive circulars or any information that experience may prompt.

Dairy Husbandry.

DAIRY SHORT-HORNS.

T. H. HOSKINS, M. D.

ADAPTABILITY OF SHORT-HORNS TO MILK OR BEEF PRODUCTION.

THE noble breed of Short-horn cattle is one that adapts itself, in the hands of skillful breeders, to every purpose for which cattle are required. Though pre-eminently a meat-producing stock, it has always from the beginning been a milk-producing breed as well. In the hands of breeders, whose aim is to make beef only, and who let the calves do all the milking, the system of these animals will adapt itself to the situation, and the nutriment goes mainly to flesh. But the potentiality of a milk-producing race exists in the Short-horn family under all conditions, and even where for years it has been disregarded, a moderate amount of care will in a few generations restore it. This, however, is in practice quite unnecessary, since the milking strains of the breed have in many localities been preserved, and kept under a constant course of improvement. This is notably the case on many farms in the Eastern States, especially in New York and New England. It may be said that in these sections the Short-horn has been as closely bred to milk as in Kentucky it has been bred to beef; and the result is a marked differentiation, whereby have been produced two quite distinct sub-breeds, that are yearly growing farther apart, and while preserving the distinguishing race-aspects in many points, are each assuming a type by which animals of each kind are at once clearly denoted to the experienced observer.

DAIRY SHORT-HORNS IN VERMONT.

In Vermont, especially, has the Short-horn been carefully bred for the dairy. This State, both by soil and locality, as well as by the tastes of her farmers, as one might say, is mortgaged to the dairying interest. The excellent market offered almost at their doors by the great cities and the manufacturing towns of southern New England (to the citizenship of which Vermont has herself greatly contributed) irresistibly urges the Vermont farmers to the task of supplying it with the choicest articles of diet, such as the West does not and cannot offer in perfection. This demand is seconded by her soil and climate, which together make grass her natural crop. Nowhere in America, not even in Kentucky (the writer has lived many years in both States as a farmer), does a richer sod exist, or one more prolific of the best grasses. The "Blue grass" is as much at home in one State as in the other, and the limestone soil in which it delights, underlies, proportionally, as large an area in the one State as in the other. Kentucky, with its large farms and warmer climate, chooses beef raising, and her Short-horns are of the grazier's type; while Vermont can show among her herds an equally good, if not equally numerous, array of the best type of milking stock. The Winslows, of Putney, have perhaps given the most notoriety to the Vermont type of Short-horns, and have recorded the highest prices received for them. The fame acquired by "Lady Sale, of Putney," and her progeny, has gone out into all lands. But although the Winslows have departed for the West, Vermont is not without many herds scarcely less meritorious, though less widely advertised.

A PROFITABLE HERD.

Among these, pre-eminent as a profitable milking herd, as well as of a very noble strain, is that of Henry C. Cleveland, of Coventry. Mr. Cleveland's father, Judge Cleveland, still living at the advanced age of eighty-five years, began the breeding of Short-horns before the era of Herd-Books, and had a large and fine stock of them as far back as twenty years ago. Since this herd has come into the hands of his son, great improvement has been made, not only by the introduction of choice and costly blood, but by a close and discriminating system of "weeding out," whereby every inferior calf and unprofitable heifer or cow has gone to the butcher without hesitation or remorse. The result is such, the milk-producing ability of the cows having been thus sedulously cultivated, that now the record shows an annual average for the whole herd, heifers and cows together, of 261 pounds of butter per head, sold in open market at a price that has netted for the current year slightly over twenty-five cents per pound, clear of freight and commissions.

Mr. Cleveland's stock at this time consists of forty-five head of pure-bred Short-horns, with twenty-three milkers. At the head of this herd stands the fine "Princess" bull, Second Lord of Malvern (14,782) six years old, whose sire was the Fourth Lord of Oxford, and whose dam, Lady Mary Second, sold at auction for $5,000. In a recent visit to Mr. Cleveland's place he pointed out to me six cows in a row, which he assured me had averaged twenty quarts of milk a day for eight months. One cow, the veteran of the herd and ancestress of quite a number of them, now in her twentieth year, records an average flow for one whole season of fifty pounds of milk per day, with a butter product therefrom of two pounds—this on grass alone. Mr. Cleveland feeds no meal or grain of any kind, except to the cows for a short time after calving, and to the calves after weaning.

In Mr. Cleveland's cow-stable the mangers are divided by partitions about four feet high, extending back about twenty inches from the manger. The cattle have each a stout strap around the neck, attached to a chain ten inches long, sliding by a ring upon an iron rod. The platforms are level, and well littered with sawdust. By this arrangement cows never get their feet in the mangers, and their flanks and hindquarters are as clean as can be.

The farm is in the valley of the Black River, 232 acres in extent, with admirable mowing and pasturage. The average hay crop is about eighty tons. In addition to this, three to four acres of corn, one to two acres of corn fodder, and a considerable quantity of oats are grown. This farm is run to make money, and money is made. Though no fancy prices are asked for stock that is sold, much of it is as good and as well-blooded as that for which very high rates have been paid.

DAIRY SHORT-HORNS IN NEW YORK.

In New York it is superfluous to say that many fine herds of milking Short-horns are found. Mr. Jonathan Talcott, of Rome, a dairyman and no speculator, reports his herd of Short-horns as usually making from twelve to fourteen pounds of butter per week, each, during the hight of the season. He has tested them alongside of the Jerseys, and gives the preference to the Short-horns for butter, without reference to their value for beef, or their yield of milk in quantity or for cheese-making. Mr. E. W. Stewart says he has authenticated the yield of a herd of twenty-eight thoroughbred Short-horns to be sixty pounds of milk each per day. Short-horn butter competes in market with Jersey butter on equal terms, when fresh, and its keeping quality is held by dealers to be superior. So eminent a dairyman as Hon. Harris Lewis, of Herkimer, after reviewing the merits of the different breeds from the dairy standpoint, gives it as his matured conclusion that the Short-horns of milking families, from the same amount of food will produce more butter, cheese and beef than any other breed; and the same conclusion finds expression from many other farmers, who have no speculative interest in fancy stock.

MILK RECORD OF REGISTERED JERSEYS.

PROMPTED to do so by the other milk records that have lately appeared in the RURAL, Mr. S. G. Livermore, Cedar Rapids, Iowa, sends us the following record of the yield from three of his Jerseys:

FLORA.

No. 1,745—American Jersey Herd Book. Dropped her last calf Feb. 23d, 1878.

Gave in April	749½ lbs. of milk
Gave in May	993 lbs. of milk
Gave in June	923½ lbs. of milk
Gave in July	834 lbs. of milk
Gave in August	805½ lbs. of milk
Amount in five months	4,305 lbs. of milk

She is due to calf Jan. 19th, 1879.

ELLA.

No. 323—American Jersey Herd Book. Dropped her last calf April 7th, 1878.

Gave in 20 days, commencing May 12	647 lbs. of milk
Gave in June	970½ lbs. of milk
Gave in July	809 lbs. of milk
Gave in August	768 lbs. of milk
Amount in three mos., 20 days	2,547½ lbs. of milk.

She is now giving 18 lbs. a day. The reason he ends the record with the month of August is the cows were away in September at the State Fair.

BUTTERCUP—4 YEARS OLD.

No. 1,746—American Jersey Herd Book. Dropped her last calf May 7th, 1878.

Gave in 20 days commencing May 12	652½ lbs. of milk
Gave in June	972½ lbs. of milk
Gave in July	844 lbs. of milk
Gave in August	800½ lbs. of milk
Amount in three mos., 20 days	3,269½ lbs. of milk.

The milk was weighed directly after milking each cow. Buttercup gave in three days, commencing May 20th, 1878, 101½ lbs. of milk from which was made six lbs. of butter. She is due to calf March 3d, 1879.

Floricultural.

CARNIVOROUS PLANTS.

IN a recent number of the Gardener's Monthly, Mr. Peter Henderson gives an interesting account of an experiment he has performed with "carnivorous plants."

To test the truth of the theory set forth by Mr. Darwin, and now adhered to by many scientific men, that certain plants obtain sustenance from animals which they catch and devour, he procured, last spring, from North Carolina a large number of Dionæa muscipula (Carolina Fly-trap). Having selected and washed the best plants, he procured two boxes, which were filled with a mixture of moss and sand, forming a soil somewhat similar to that which the plants had been growing in naturally, and a hundred strong plants were planted in each box. The plants in one box were covered with fine wire-gauze to exclude insects, while those in the other box were systematically fed, every day, with flies and other insects. After a lapse of three months from the time the feeding began, the operation was discontinued, and the most careful examination and comparison failed to show the slightest difference between the one hundred plants that had been fed, and the one hundred, under the netting, that had not been fed. Both lots had made a splendid growth, and were the admiration of scores of visitors. Mr. Henderson holds that this experiment disproves, or at least tends to disprove, the above-mentioned theory.

But it is fair to state that this one experiment ought not to weigh heavily against many like experiments which were carried on with great care by Mr. Darwin.

Everywhere.

RURAL SPECIAL REPORTS.

ILLINOIS, Baileyville, Ogle Co., Dec.—We had a lovely Indian summer, and on account of the favorableness of the weather, the farmers got their corn all husked in due season, and are better prepared for winter than usual. Some commenced plowing again, after their corn was cribbed, and continued plowing until Dec. 6, when the ground froze solid and put a stop to field work.

The corn crop was excellent in this locality, both in yield and quality, and was saved in prime condition. Clover-seed has turned out poorly; some was considered not worth hulling; and as the price of seed is only about $3 per bushel, out of which $1 must be paid for hulling, besides other expenses, it doesn't pay. The farmers have but little to do now, except to tend their stock and keep up the fires, and as coal is mostly burned here, instead of wood, it requires but little work to provide fuel. A good many farm hands are idle or merely helping with the feeding for their boarding. The wages paid the past season of eight or nine months, were from $16 to $18 per month, with board and washing. Day laborers got from 75 cents to $1 per day and board.

W. B. D.

PA., Wellsboro', Tioga County.—This section of country is high and rolling, well watered and well adapted to dairying, which is carried on to quite a considerable extent. Crops have been very good with the exception of potatoes and apples, which were not more than half a crop. The dry weather in the early part of the season spoiled the potato crop, and a heavy frost on the last of May cut our fruit in most localities. The weather from the 1st of August to the 15th of October was fine, but from then down to this date, it has rained almost every day, consequently the farmers are much behind with their fall work. Our market prices are as follows: winter wheat $1.00 per bushel, spring wheat, 80@90 cts.; barley, rye, 75c.; barley, 75c.; corn, shelled, 50c.; buckwheat, 50c.; oats, 25@30c.; potatoes, 50@65c.; apples, 60 cts. per bushel; eggs, 18 cts. per doz.; butter, 25c. per lb.; pork, dressed, 3.00@$4.00 per cwt.; beef, 4 cts. per lb., live weight; cows, $25.00; hay, $6 per ton; sheep, $2.50@$3.00; labor is very low; we can get the best men on the farm for 50 cts. per day or 8.00 to $10.00 per month.

W. O. R.

IOWA, Lettsville.—The soil of Iowa, like that of most other States, will not bear a continual cropping of the cereals without exhaustion; even the virgin prairie soil after fifteen successive crops needs rest. The usual method of recuperation is by seeding down to timothy and clover for meadow and pasture; hence the successful farmer must adopt the rotation system of farming best adapted to the kinds of soil to be worked. Persons of large means who have their acres by the thousand, have nearly quit grain farming, choosing stock raising in preference. Three continuous wet seasons have awakened the farmers in some localities to the importance of tiling their low grounds; a machine for putting in tiling is in use in this community, which is a success; from sixty to eighty rods a day can be put in without the use of the spade. A diminutive "mole-plow" used in marking off ground for corn drawn by three horses at a depth of nine inches, proved beneficial on partially exhausted ground during the past season. C. F.

NEW YORK, Rochester.—The fall, after our season of drought, has been very favorable for the growth of the wheat plant, and wheat is looking much better than was expected, the middle of October. The growth is not large, but strong and stocky, and large enough I think to winter well. A wide area has been sowed; for, notwithstanding the low price during the past fall, farmers generally have cleared as much profit from their wheat fields as from any department. Then, too, it is a pleasant crop to grow, and one that is always readily convertible into cash. Farm wages have been higher proportionally than in other trades—for which the farmers are generally to blame—a dislike of changing hands causes them often to pay more than the market price for those they do hire. Apples have been a drug on the market; fine fruit selling as low as 75c. per bbl.—barrel included—which cannot leave much margin for the producer. Potatoes are scarce and now command 80@90c. per bushel in our markets. Cabbage $4 per 100 heads. Beef and pork lower than last year. H. T. J.

NEW YORK, Great Bend, Jeff Co., Dec. 13th, 1878.—Crops, with the exception of corn, were poor. This town does quite a heavy trade in potatoes generally; as the soil hereabouts is inclined to be sandy, this crop is easily cultivated and generally of good quality; but the beetle did his best to spoil the crop for us during the past year, and those who did not fight early and late, are now compelled to pay the more persevering ones from 80c.@$1.00 per bushel for the tubers, or speak of them as the fox spoke of the grapes, and eat buckwheat cakes instead. Prices are at present here: wheat, $1.; oats, 30c.; corn, 48c.; rye, 40c.; butter, 13@18c.; pork, 3½@5c.; beef from 5@6c.; hay $7.00 per ton; cows from 20@$30, according to age etc.; sheep, 3.00@$5.00; eggs, 15c.; work is scarce and wages low; plenty of men for 50c. per day and board.

E. H. O.

MISS., Okolona, Dec.—Hereabouts, aside from the large plantations run by men of education and capital, farming has generally been in the hands of uneducated men, who, however incapable they may be of making agriculture a success, are still more unfit for every other sort of occupation. In this immediate neighborhood, there has been an almost total failure of crops. Cotton, our great staple, has yielded, in many cases, only a bale of about 450 pounds to five or six acres, while in some instances it took ten acres to yield a single bale, and this has to be sold for from seven to eight cents per pound. The present hard plight of our people is mainly due to their failure to raise at home such necessaries as corn, meat, and flour. W. H.

NEW YORK, Syracuse.—Diphtheria, and Scarlet fever prevail extensively hereabouts, reminding one of the old adage; "A green Christmas makes a fat graveyard." Farm produce sells low in our market. Wheat, 90c.@$1.00 per bushel; Oats, 25@30c.; corn, 50@55c.; dressed hogs, $3.50@4.00 per hundred; potatoes 70@80c. per bushel.; apples, 25@40c. per bushel; butter, 20@22c. per lb.; eggs, 25c per dozen. Evidently the prices of farm produce have touched bottom; but careful inquiry has failed to discover where salaries of Government officials have been reduced. N. RITTER.

WASHINGTON TER., Colfax, Dec.—The early rains started the Bunch-grass, which covers this whole land, and it is now two or three inches high. Cattle, horses and sheep are in fine condition to go through the winter, as they generally do without any other feed than the famous Bunch-grass. Crops here were very good; vegetables the finest I ever saw. We had many potatoes of the Garnet-Chili, Eureka and Early Rose varieties, that weighed 2½ to 3 lbs, and some that weighed 4 lbs. Prices are: Wheat, 50c; Oats, 60c; butter, 25c; eggs, 25c; potatoes, 50c. H. M.

OHIO, Celina, Dec.—Corn was a good crop on underdrained land; less than half a crop on land not drained. A full average breadth of wheat was sown and looks fine. Pastures, properly cared for, look well, and young stock are doing well, with but very little feed. On account of low prices, and lack of drainage, farming in this locality is paying very poorly. Wheat is selling at 80c.; corn, 25c.; oats, 18c.; rye, 40c.; buckwheat, 50c.; hay, $5 to $7; pork, $2.25; cows, from $20 to $40, as per quality.

G. W. R.

IOWA, Watkins, Dec.—Seeing an item in the RURAL about the "Lost Nation" wheat, I would say that it is a very good kind. A nephew of mine had a piece of about twenty-one acres that yielded the past season 440 bushels of good wheat. Times are very hard and prices are very low. Crops were good, except wheat. Fruit, of all kinds, was good. Hogs, $2 to $2.25; cattle, $2 to $2.30; wheat, 40 to 64c.; oats, 13c.; corn, 16c.; barley, 20 to 40c.; apples, 50 to 75c. C. G. H.

OREGON, Silver Wells, Wasco Co., Dec.—This is a newly-settled country; consequently farming is almost untried here yet. There is much rich soil in the small valleys among the mountains, but the climate is too cold to permit the growth of any but the hardier kind of vegetables. Stock-raising is the principal industry here. Cattle and horses usually winter well without feeding either hay or grain.

T. H. LA. F.

CANADA, Capetown, Ont.—The wheat, corn, potatoes and hay crops hereabouts were very good; barley and oats, however, ripened too soon. The apple crop is fair, the curculio having almost disappeared. The Snowflake potato does well on this soil—a brown sandy loam. The flower garden and house plants are always a success in their season, owing to good seeds and careful attention. G. G. K.

NEW YORK, Croton, Delaware Co., Dec.—This has been a season of abundant crops in this locality, with the single exception of potatoes, which were very light, many farmers not raising enough for their own use. The dairy interest is the main dependence of this county, though more grain has been grown for a few years past than for a long time previously. We have had a mild fall, with a great deal of mud, for several weeks past. Winter is now with us for something of a stay. A considerable amount of the butter hereabouts has been sold at prices ranging from 18c. to 22c., though quite a proportion of it remains unsold.

E. J. B.

OHIO, Ripley, Dec. 17, 1878.—Wheat is looking well. Crops were all good, except potatoes. We never had so many apples; more of them are rotting on the ground this year than the whole crop yielded last year. Wheat is selling for 80@90c. per bushel; corn, 30c. for 72 lbs.; oats, 20c.; butter, 12c.; live hogs, $2.25; choice winter apples, 45@60c. per barrel; clover seed, $3.60 per bushel. A great deal of rain since the first of November has made muddy roads.

J. R. T.

KANSAS, Burlington, Dec. 19.—Contrary to what one might expect, what is generally called old-fashioned farming is carried on to a greater extent in newly-settled than in long-settled parts of the country. Probably a similarity of conditions between the early settlers in both cases, begets a similarity of methods. Hereabouts the main object of each farmer is to see how much land he can cultivate, not how well he can cultivate it.

F.

KANSAS, Perry, Jefferson Co., Dec. 20.—We have had more snow this winter than for three years past. A week ago it snowed twelve inches which have since settled down, and it is snowing again now. The ground, however, has not been frozen. A good deal of the winter wheat looks bad; that sown early alone looks well, and much of that also has been injured by the fly.

B. B.

NORTH CAROLINA, Warren Co. — Present prices here are: cotton, 7½c.; corn, 60c.; dressed pork, 4c.; eggs, 15c.; butter, 25c. to 30c.; fodder, 75c. per 100 lbs.; oats, 40c. per bushel. Some of our vineyardists report a new departure in mildew—new at least here. It affects the canes, and is more noticeable on trellises than on stakes. I hardly think it will prove at all disastrous.

M. B. P.

RURAL FARM, Queens Co., N. Y.—Our winter wheat is looking exceptionally good, and we hope another summer to make interesting reports as to the comparative value of different methods of cultivation. The first really cold weather has occurred within the few past days.. Much rain—little snow.

KANSAS, Modena, Butler Co., Dec. 16.—We are having splendid winter weather here. Early-sown wheat is looking well and promises a good crop. All farm products are low: pork, $1.80; cattle, 2c. on foot; corn, 15@20c. per bushel.

J. B.

KANSAS, Hoplen, Crawford Co.—All early sown corn was a good crop; late corn, however, was poor. Oats, good; wheat, fair to middling; potatoes, poor. Cattle look well, but the price of everything is low.

A. S.

The Querist.

ANSWERS TO CORRESPONDENTS.

Is There a Best Kind of Gypsum?

J. R., New York City, as between Cayuga and Onondaga land-plaster or gypsum, asks which sort is the best for fertilizing purposes, and outside of the immediate localities in which each is produced, which has the best reputation among practical farmers, and also how they compare with Nova Scotia gypsum, and whether either of them is not as good as that variety.

ANS.—Gypsum is always simply gypsum when it is pure. There are two kinds of gypsum, namely, common or hydrous sulphate of lime, which consists of lime, 32½ per cent, sulphuric acid, 46½ per cent, and water, 21 per cent; and the rarer anhydrous sulphate of lime, which consists of lime, 41.2 per cent, and sulphuric acid, 58.8 per cent. Everywhere pure gypsum consists of these combinations, being in fact a salt of lime, in combination with water in the case of the common, or hydrous gypsum. But it is rarely that this substance exists in a state of complete purity, being frequently mixed with silica, carbonate of lime, sulphate of iron, and some other impurities. The proportion of impurities contained in the gypsum, as a matter of course, reduces the value of it as a fertilizer in the precise ratio in which the quantity of pure gypsum is reduced. The producers of this fertilizer find it to their interest to sell the purest article they can get, and generally the different kinds on the market do not show any serious variations in their composition. The Nova Scotia gypsum, and that from Cayuga and Onondaga, in the State of New York, as found in commerce, do not vary appreciably in composition, because the miners reject inferior qualities for obvious reasons, and the amount of pure specimens to be picked out of a ton of either kind is about the same in one as in another, and these cannot be distinguished one from the other by their appearance. As a matter of convenience, the New York plaster is used near where it is quarried, and the Nova Scotia near the Atlantic coast. The Nova Scotia plaster sometimes comes in competition with that of New York, but as yet no one who has used either could probably see the slightest difference in their effects. The New York plaster is white when ground, and some of the Nova Scotia is blue; the dark color is disliked by many who use it, but more from prejudice than for any better reason. It might also be noticed that pure gypsum is soft and easily ground, while the impure contains hard nodules that are difficult to grind; the plaster millers, therefore, are apt to reject impurities and grind only the pure stone. On the whole, the New York gypsums would doubtless be preferred by farmers.

Poultry Roosts, Food Vessels and Nests.

N. O., Waterville, N. Y.—asks the best way of arranging the above conveniences of a poultry house.

ANS.—Arrange roosts all on one level, not one above another, as is too often done. The fowls will fight for the top perch, when one is higher than the other. It is better to have the perches lie in notches in cross pieces, on posts, and not touch the sides of the house. They will not then infect the building with parasites, and can be taken out and cleaned easily. Roosts raised from two and a half to three feet are high enough for ordinary-sized birds, but roosts one foot and a half from the floor are high enough for Asiatics.

For drinking purposes, an open vessel or dish is better than a fountain as it can be more thoroughly cleansed. The vessel should be covered with a grating of wire or lath sufficiently open to permit the birds to put their heads through to drink, but sloping enough to prevent them from walking on it, or sitting on the edge of the vessel and soiling the water. A similar arrangement should be used for vessels intended for soft food. Hoppers should be used for grain, crushed oyster shell, and bone, that have a hole near the bottom edge, with a small tray in front to catch the grain, etc., so that no more will run out than the birds consume.

The nests can be arranged economically in boxes three and a half feet long, fifteen inches wide, the front and the ends eight inches high, the back three inches. The roof should be two feet wide, and slope from the front of the box upward and backward so as when set against the wall, to leave a passage under the roof, behind the box, open at the ends, for the fowls to pass in that way, as the front will be all closed. One board of the roof, next to the front, should be hung with hinges, so that it can be lifted up to get at the eggs and nests, This box will hold three nests, each a foot square inside, and four or five inches deep, with one side of two of the boxes high enough to form partitions between the nests, when set in the box. A number of such nest boxes can be placed next the wall either on the floor or raised about two feet on shelves, an arrangement that will give more floor room. The sloping roofs will prevent the fowls from soiling the boxes. There should be no fixtures; all should be portable so as to facilitate thoroughly whitewashing and cleaning.

How to Destroy Wire-Worms—Artichokes as Hog Food.

W. T. Arnold, Beaver Co., Pa., 1. Has a very productive piece of bottom land thickly infested with wire-worms. It was sod land, but was broken up last year and planted with corn, and he wishes to plant on it the same crop this spring, but is afraid the wire-worms would destroy it, and accordingly asks the best mode of destroying them. If salt enough to kill the pests were applied, he inquires whether it would injure the corn crop next year, and desires to learn what quantity should be used and when should it be applied. 2. He also asks, whether it would pay to raise artichokes in that section, as food for hogs.

ANS.—If a field is thickly infested with wire-worms it will not be advisable to trust to salt, plaster and other quack remedies, for their destruction, though fertilizers that increase the growth of the crop, help indirectly to overcome the insect enemies. The surest method of destroying the wire-worm is undoubtedly by the combined force of starvation and exposure to swine and birds. Destroy all vegetation for a season, plow the land in spring and early fall, and if possible once during the summer, so as to bring the pests to the surface and give the birds a chance at them. Frequent harrowing will aid in the same object. In this case, as the season is now too far advanced for plowing the land, do so next spring, and give the birds a chance at the pests some time before planting the corn. If the crop should prove a failure, it may perhaps be best to repeat the above plan next year.

2. Helianthus tuberosus, or Jerusalem Artichoke, may profitably be raised as food for hogs; but to obtain the best result, it should have a rich, mellow soil, and once established in such a soil, it becomes hard to eradicate. For this reason it is best to set aside some out-of-the-way corner for its culture.

Remedies for Roup.

W. H. M., Haddonfield, N. J., wants to learn what is the matter with his poultry and a remedy for the ailment, by whatsoever name it may be known. The symptoms are: birds drooping, standing about with eyes shut as if asleep; the head is swollen, with small scabs or dark lumps on face and comb; the eyes of some are closed tight with yellow matter which is hard, like corn; dung, watery, of a dark-brown, glazed color. Stock, Light Brahmas and Cochins.

ANS.—The trouble is *roup*, with a tendency to cankerous affection. For remedy: wash the head twice, or oftener, daily with vinegar and water, or with a weak solution of carbolic acid, and apply vassoline or carbolic salve to the sores. Give roup pills of known value, as per directions accompanying them, and also a tonic. "Douglas mixture" is good. A friend who is a large and successful poultry-keeper, gives a teaspoonful of rum and molasses two or three times a day. Remove the sick ones from the flock without delay, and put them in warm, dry quarters. Give the rest "Douglas mixture" in their drinking water.

Steam Plows, Etc.

F. G. R., Mansfield, Pa., asks where he can get a steam plow, or any information concerning that and other agricultural implements.

ANS.—A note addressed to Wm. C. Oestler, 43 Exchange Place, New York, will secure complete information concerning steam-plowing. R. H. Allen & Co., New York, will, on application, send circulars of "all kinds of agricultural implements." The inquiry is so general that we cannot answer it directly. The RURAL gives special attention to agricultural machinery: full descriptions of all new inventions and improvements that have been made in the well-known machines, will be found under the head of "Industrial Implements."

The Stump Apple.

N. R., Syracuse, N. Y., says he wishes some well-informed pomologist would carefully examine this apple—reported to have originated on an oak stump—and explain wherein it differs from the Indiana Red Stripe.

ANS.—Mr. Downing says of the Red Stripe: "Comes to us from Indiana; origin unknown. Fruit oblong, whitish, considerably striped, splashed and mottled with crimson. Core large and open. August." Of the Stump, he says: "Supposed origin Delaware. Fruit oblate, yellowish shaded with light red nearly over the whole surface. Core small. September and October." We have merely noted points of greatest difference.

Destroying Craw-fish on Overflowed Land.

R. M. T., Hackersville, W. Va., says his meadows are frequently overflowed, and consequently are often beset with craw-fish, and he asks for some cheap plan for destroying the pests.

ANS.—There are no means of ridding the ground of crawfish, except by draining it. If the land were drained by shallow ditches, so as to carry off the surface water as quickly as possible, some relief might be found. But the probability is, that so long as the ground is subject to overflow and is soaked with water for considerable periods, the craw-fish cannot be ejected from it.

Yield of Beans.

J. K., Bellevue Ohio, asks what variety of beans will give the best yield on a clay loam, and how much per acre that yield should be.

ANS.—All beans prefer a good loam or sandy loam. We cannot say which "variety" would do best upon a clayey loam, but should prefer the Kidney, Snap or Dwarf varieties. Some of these, as the Black Wax, are valued for earliness; some, as Early Mohawk, for hardiness; some, as White Wax, for family use; some, as Refugee, for lateness and pickling. These should yield upwards of 100 bushels per acre. Of the pole beans, Large White Lima is as good as any and should yield eighty bushels per acre.

Piano-ettes.

J. M. P., Turnersville, Coryell Co., Texas, asks whether C. W. Strong & Co., of Boston, Mass., are trustworthy, and whether the Pianoettes they profess to sell for four dollars are humbugs or not.

ANS.—Strong & Co. are trustworthy. The "piano-ette" is a small revolving cylinder, under which a piece of perforated card-board is rolled, the perforations permitting the protuberances on the cylinder to hammer on metal plates, on the principle of a music box, and by this means the air is produced. It is a very crude musical instrument.

Who are Entitled to Free Seeds?

Many Subscribers inquire whether they will be entitled to share in the free-seed distribution if they subscribe through an agent, just the same as if they sent their subscriptions directly to this office.

ANS.—All subscribers whose names are on our books, whether their subscriptions have been sent us by themselves, their friends or our agents, are equally welcome to participate in the distribution. We must have some protection and draw the line somewhere, and we do so under the applicant's name in the books of this office.

Clover Seed for Dyeing.

O. B. M., says that he has seen it related that clover seed is used for a coloring pigment for calico goods, but he doesn't know where to search for authentic information on the subject and asks the RURAL to publish the process.

ANS.—If it was stated where the above was related, it might have been some help to investigate this matter. After searching many technical books on the subject and inquiring from several experts, nothing can be learned of the use of clover seed as a dye stuff. We have never heard of such a use for it.

Where to Get Seed of Acme Tomato.

W. H. M., asks where can he purchase from a *reliable* dealer *pure* seed of Acme tomato. He wants enough for two acres.

ANS.—Of Thorburn & Co., R. H. Allen & Co. of this city; James Vick of Rochester; J. J. H. Gregory of Marblehead, Mass.; Landreth & Sons, Henry A. Dreer, Phila.; D. M. Ferry & Co., Detroit; Crossman & Bros., Rochester; Stair & Kendal, Cleveland; J. B. Root, Rockford Ills.

Market for Sage.

M. L., Alfred, Allegany Co., N. Y., having raised 100 lbs. of sage, asks where he can find a good market for it.

ANS.—It would not pay to send so small a quantity hither to market. The freight and expenses of handling it would be more than it would sell for. Sage is now sold very low at wholesale, and at the best would bring only a few cents per pound.

"Steep" to Hasten Germination.

S. C. B., Detroit, Mich., asks for a formula for the preparation of a "steep" to promote the rapid germination of seeds.

ANS.—We do not believe in any "steep" for this purpose, and advise our friend not to spend his money for quack preparations which are sold for this purpose.

Moore's Early Grape.

J. A. M., La Cygne, Kansas, asks what are the merits of Moore's Early Grape.

ANS.—Hardiness, size and quality. We have never tested it. We merely answer the question as to what is claimed.

Thrips.

S. B. P., Muskegon, Mich., sends us a sprig from a rose bush having spots on the leaves, and asks what causes them.

ANS.—Thrips.

Miscellaneous.

E. F., Providence, R. I., having been advised to sow Fife wheat, asks where seed of it can be had, as the catalogues do not mention it.

ANS.—Fife wheat is a spring variety, grown largely in Canada and Michigan, where spring wheat is a usual crop. As a matter of course, it is not kept for sale in R. I. where spring wheat is not grown. The seed may be procured from Rennie & Co., Toronto, Canada, or Ferry & Co., of Detroit, Mich.

J. W. S., asks 1. whether any plants from the free seed distribution bear edible or poisonous fruits; 2. what is the best thing to keep boots soft and water-proof; 3. the best poison for rats.

ANS.—1. No poisonous plants; of course, the tomato &c. are edible.

2. A mixture of beeswax and neat's-foot oil.

3. Phosphorus paste is as good as any poison.

A. W. G. Brockville Canada, asks if G. W. Turner & Ross are trustworthy and if their goods are as represented.

ANS.—G. W. Turner & Ross are responsible and the "Alexis" revolver is good enough for the money.

C. H. D., Nunda Station, N. Y., asks where Alfalfa seed can be obtained.

ANS.—Answers will be found in several late issues of the RURAL.

J. N. W. Brandon., Vt., asks where he can get a pair of Brown Leghorns and their price.

ANS.—Write to Geo. S. Josselyn, Fredonia, N. Y.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY JAN. 4. 1879.

We will be pleased to send one or more copies of the RURAL NEW-YORKER *free to any of our subscribers sufficiently interested in its welfare to be willing to hand them to their neighbors for inspection. An intimation by postal card will suffice.*

OUR readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to* THE RURAL PUBLISHING CO., *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

OUR readers are particularly requested to read the particulars of our free seed distribution on p. 17, under publisher's notices, before ordering seeds.

WE offered, some time ago, to sell the cuts used in this Journal for twelve cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

CHEESE AS FOOD.

The very low price of good cheese and its production in excess of demand have led the manufacturers into a serious consideration of the methods by which the home consumption can be increased; and this, of course, brings up the question of the value of cheese as food. Is it true, as is claimed by a leading stock journal, that cheese contains at least fifty per cent. more nutriment in a given weight than beef? As the two retail at nearly the same price, this is an exceedingly interesting question.

Let us first look at the matter from the point of production. It has been lately shown that a fattening steer and a milch cow eat yearly nearly the same amount of food for a given weight and time, and that the products of gain in beef on the one hand and milk on the other, are of almost identical food value. In the light of such facts, does it seem reasonable that the cheese producer can go to the extra labor of milking and manufacturing the cheese and still undersell the beef producer by thirty-three and one-third per cent.? In a time of great depression like the present, beef as well as cheese must be sold at very nearly the cost of production; and as both are largely exported, we must consider the effect of this on the price to be nearly the same with each. If, under such circumstances, the cheese-maker can give us fifty per cent. more food for our money than the beef raiser, it is a most interesting question for all agriculturists to know how he can do it.

Bischof, Henneberg, Stohmann, Grouven and others have found the composition of pure lean flesh to be about twenty per cent. of nitrogenous matters and from four to ten per cent. of fat; but as E. Smith remarks, in his work on food, this is not a fair way to arrive at the food value of any part of the beef. For in every case a certain amount of pure fat is attached, which is used as food and increases the value. The only proper way to arrive at the food value of beef is to accept the results obtained by Lawes and Gilbert in determining the percentage of fat and flesh used as food when the whole carcass is considered. These gentlemen found that in every 100 lbs. of fat beef there were fifteen pounds of nitrogenous constituents and thirty-five pounds of fat. Now, average new-milk cheese contains per 100 lbs. about twenty-three pounds of nitrogenous constituents to thirty-one pounds of fat; that is, four pounds less of fat and eight pounds more of nitrogenous matters. It is known that in the body by far the greater part of nitrogenous elements of the food are transformed into fat and consumed for the production of heat; and in this transformation two parts of the former are required to produce one of the latter; consequently, the eight pounds of nitrogenous matter in the hundred pounds of cheese in excess of that found in a like quantity of beef, are fully counterbalanced by the four pounds of fat which the latter contains in excess of the former. Cheese and beef of this composition should, therefore, be of about equal food value, if equally digestible—which is not the case.

It is true that some kinds of cheese make a better showing than this, especially those that have an extra quantity of cream incorporated; but when we consider that a considerable part of cheese is not digested, as was proved by E. Smith, it will not do to give the best cheese a greater food value than beef.

We are not endeavoring, by this statement of facts, to prevent the increased consumption of cheese—our business is, first of all, to furnish facts, and allow all things to stand on their true merits. We believe, however, that the home consumption of cheese can be greatly increased with advantage to consumer as well as producer—not because as food it is cheaper than beef, but because it increases the variety and makes an agreeable relish. But before consumption will be greatly increased, the execrable stuff kept at too many country stores must be replaced by an article of real value. Much of the lower grades of cheese is absolutely unfit to be eaten. Not only is it without value as food, but it does harm by disordering the digestive function. When the cheese manufacturers see to it that our country stores keep nothing but the best quality of cheese and sell it at a reasonable margin, they will find the popular appreciation of this article of diet to increase very rapidly and, what is of more importance to them, the amount consumed will increase in the same proportion.

EXCESSIVE YIELDS OF CORN.

THE largest well-authenticated yield of corn was one of 140 bushels to the acre, in South Carolina, a State where the average is not far from twenty bushels. This shows, in a degree, the possibilities of this wonderfully-productive grain. There are those who believe in the still higher possibility of producing, with every circumstance favoring, as much, even, as 200 bushels of dry, shelled grain on a single acre of land.

To show how such a crop may appear possible, at least on paper, let us estimate, first, the number of individual plants that can be made to grow and produce full ears on an acre of ground. We will take the common eight-rowed corn of New England as the basis of our calculation. With rows three feet apart, there will be 14,520 feet of row to the acre. By drill planting the single kernels being dropped uniformly, six inches apart, there will be, if all grow, 29,040 plants. As by actual trial 225 full ears of this corn will, when well dried, produce one bushel of shelled grain, a few figures will show that an average equal to one full ear to each stalk, will give 128 8-9 bushels of shelled corn. Double this, by getting two full ears per stock, and the crop will be 257 7-9 bushels. Yet in face of these figures, the fact remains that it is extremely difficult, under the best methods of culture now in use, to get a yield of 100 bushels to the acre; while the average of the country is about thirty bushels, or nearly the same as the average wheat yield in England.

There is no great difficulty, with good seed, good soil and good cultivation, in doubling this average. There is a goodly number of farmers who, one year with another, do not fall short of securing sixty bushels—a ton and a half—of dry, shelled corn from every acre planted to this crop. Occasional crops of seventy or eighty bushels are recorded every year, while 100 bushels are sometimes claimed, but subject to the incredulity of most hearers. No one, however, who has had experience in corn culture on favorable soils, can doubt that 100-bushel crops are occasionally realized. At the same time it is absurd to expect that the ideal possibility of 257.7-9 bushels can ever be realized since this requires not only the exact planting and perfect gemination of every seed, but the arrival of every plant to maturity and its production of two full and perfect ears, or their equivalent in imperfect ones.

Nevertheless, it is well to keep the ideal in mind as a stimulant to exertion. There can be no doubt that the habit of producing two ears (under ordinary close culture) can be bred into corn. Indeed the natural habit of the corn plant, where it has sufficient area to develop itself fully, is to produce multiple ears. Corn widely planted, and kept free from weeds, "tillers" like wheat and other cereals. Fifteen or twenty ears are thus sometimes grown from a single seed. But for the best results in field culture, the less of this tillering, or suckering, the better. We want to breed out that habit of growth, and breed in the habit of setting several ears on a single stock. Dr. Sturtevant aims to do this by close planting and "root pruning;" that is, repeated deep cultivation with a sharp-edged implement running close to the rows of corn plants. In this way he hopes to reduce the luxuriance of stem and leaf, (as seen in the plant where its full individual development is permitted and encouraged), and to get in its place a single stock with multiple ears. Anatomy of the corn plant reveals the fact that the germ of an ear exists at every "node" or joint. Under the ordinary conditions of culture, only one, or occasionally two and perhaps three, of these are developed so as to yield seed. The point of practice is to render this occasional occurrence a habitual one. We see it in the "pop-corns;" we aim to produce it in the common field varieties.

Some years ago a field of the long-eared white pop-corn was planted. Manure had been drawn and piled in the field the previous fall, which was spread in the spring. When the crop was cut up, it was discovered that where the rows of "pop-corn" crossed the spots on which the manure had stood all winter, ears were developed a foot long, with kernels as large as those of ordinary field corn, these ears looking precisely like those of the white variety known as the "Sandford" corn. These ears were as numerous on the stalk (two and three) as elsewhere, and there was no very great excess of luxuriance in the hight or leafage of the plants. Not much significance was attached to this occurrence at the time, but the recollection of it now suggests the thought whether there is not instruction to be drawn from it regarding this matter of developing the habit of multiple earing. This sudden transformation of small ears into large ones under the stimulus of high manuring, without a proportionate growth of the plant itself, seems to suggest that multiple earing is promoted (other circumstances favoring) by poverty of the soil, within certain limits. We suspect that a moderate deficiency of nitrogenous food, and an abundance of potash and phosphoric acid, are the right conditions for developing multiple earage.

If this idea should prove correct, does it not point to the conclusion that, in order to reach as nearly as possible a maximum yield of corn, the *seed* will require to be grown upon a different soil from the *crop?* In growing *seed*, may it not be best to be sparing of nitrogenous fertilizers, while in a crop from seed so grown, where the largest production is aimed at, we should fertilize the ground profusely with all the necessary elements of plant-food?

Our experience during the past year, has been very favorable to this view of the matter. We throw out the idea, to be thought over and experimented on by others. Certainly we have discovered (others may have discovered the like before) that a thoroughbred corn, carefully grown upon one farm for 60 years, and so persistently selected for eight rows as not to give in a large field a single variant specimen, may in one season, under high manuring, (without opportunity of "crossing") develop not only a remarkable yield, but a large percentage of ten and twelve-rowed ears, besides various other abnormalities, such as clusters of ears, numerous huskless ears on the ends of the stalks, etc. These things are worth studying.

MOISTURE-RETAINING POWER OF THE SOIL.

WE have never raised the question whether it was or was not desirable to stir the soil. That it *is* advantageous seems to us as plain as it seems to the many who have written to us to prove that it is so. A loose soil "imbibes" more moisture than a compact one. Nobody will dispute that. But, limited, of course, as to extremes, we say the loose soil will by capillary attraction part with more moisture than the compact one. Hence, *stirring* it, instead of tending to confine the moisture; instead of "breaking the capillary tubes," etc., etc., tends in the opposite direction.

In our experiments, we found that the water did not return to the surface at all in the pots which were filled with pure sand such as is usually used for mortar, except about the edges, which was due, no doubt, to the pot itself exerting a stronger capillary power than the sand. The cohesive power of such sand is so slight that the capillary power is nearly imperceptible. It was for this reason that we stated in our first experiments, several years ago, that sand should prove an excellent material for a mulch.

Several of our contemporaries and a number of correspondents, in proof that a compact soil will dry out sooner than a loose one, have cited the turnpike road as compared with the cultivated field. The amount of rainfall which passes through a turnpike road must be very slight. Except in long-continued rains only the surface is wet, while at the same time the loose soil may become saturated, and as the moisture evaporates from the surface, it may be resupplied from underneath.

While we need not at this time make further remark, we take occasion to refer to that paragraph of Dr. Sturtevant's article (p. 7), which begins "In some observations," as of much importance.

Catalogues, Etc.—It is seldom that we write about any plant—be it vegetable, flower, shrub or tree but what we have inquiries as to where it can be purchased. Under the sub-heading of Catalogues, &c. Received and under the department heading of Miscellaneous, we announce as we are enabled to do so, the receipt of the catalogues of the seedsmen, florists and nurserymen of the country; and it is in these catalogues or pamphlets that such plants will generally be found. We have been very careful to present these valuable books of reference according to their merits and not according to the advertising patronage which we have received or hope to receive from those who offer them to the public. In many cases they are offered *free* to applicants—in no instance is more than a nominal sum asked for them. Now, for the benefit of our readers who desire to purchase the best seeds or plants at the lowest prices, we say *send* for these catalogues as they are announced. Read them over—make marginal notes and so, when it is time to buy plants or seeds, be prepared to purchase those which will prove of most value.

BREVITIES.

A POTATO called Woodstock Kidney was awarded the prize as the best at the late show at Birmingham, England.

WE call attention to a series of articles entitled "The History of a Poor Farm," the first of which appears in this number. The name of the author will not appear at present, but we may say he is one of the foremost agricultural writers in this country.

A CORRECTION.—Mr. B. Pickman Mann writes: "Your types have taken a freak this week Dec. 21st to put me in a false position on your editorial page. I wish to put myself right by disclaiming any ownership in the letters Hon. prefixed to my name in your list of contributors, said letters belonging rightfully in front of the name of the distinguished gentleman mentioned in the next line above."

OUR CONDENSED PROSPECTUS FOR 1879.—Not to praise a friend beyond his merits *because* he *is* a friend;—not to condemn an enemy *because* he *is* an enemy;—not to admit any advertisement that can be misleading or in any way hurtful, *because* it pays;—not to interfere in matters that do not concern us, and—to do our best in matters that *do* concern us.

A DESIRE to see the greatest works of their kind in the world is natural. Within a short walk of the RURAL office is a work of this kind. We refer to the "bridge" which "connects" the cities of New York and Brooklyn. As a stupendous failure we do not think it can be equaled. Viewed in this way, our friends may while visiting this metropolis wish to take a look at it.

IF the friends of the RURAL NEW-YORKER will now speak a strong, hearty word in its favor to their friends and neighbors, they will materially help to advance the interest of a paper which has their own best interests always at heart. Now is the time to do this with the best results. Procrastination in this matter is doubly a thief, depriving the RURAL of many probable subscribers and them of its valuable lessons. Here, emphatically, "a stitch in time saves nine."

SEVERAL weeks ago it was stated in the RURAL that we would thank our friends if they would send to this office a specimen ear of the best corn they had raised. From the wording of the request we supposed it would fail to attract the notice of the general reader. From the responses, however, we could make a very creditable corn-show. Some of the ears were sent to the RURAL EXPERIMENTAL GROUNDS—some were given away and we have still in this office enough to fill a barrel. We mention the above to acknowledge in grateful earnestness the kindly feelings which our friends have shown us upon every occasion that has presented itself. We daily have occasion to regret that we can not write our personal thanks to the hundreds of RURAL subscribers who thus place us under obligations.

WE often regret that our quail are so hunted and nearly exterminated season after season, and wish some law could be devised and enforced to prevent the slaughter. If those who own the land upon which the birds are bred and live, choose to kill them, we have nothing to say. But we cannot protect them if we would against the hordes of sportsmen, as they call themselves—crazy-heads and loafers as we should call them—who, as soon as the "law is up" scour the country and bang away at the last feather. Taking them as a class, these people, while on their hunting sprees, make every other interest subsidiary to their own, and they are often unwilling to lose the chance of killing a bird even though they take the chance of firing into an out-building or in dangerous proximity to animals and men. If country people had any way of restricting these worse than tramps, quail could be made to become as domesticated as chickens.

Literary Miscellany.

A THANKSGIVING PARTY.

BANKS and his wife consulted
One bright November day,
Planning a splendid dinner
In a pleasant, airy way.
"We'll have a grand Thanksgiving,
Said Banks: "And Polly, dear,
You get the guests together,
And I'll provide the cheer."

Then Banks, with heart o'erflowing,
Said, "Now's the time, my dear,
To ask one's wife's relations,
So let them all be here.
Yes, ask them all, my darling;
Your husband's not the man
To stop half-way in making
A pleasant family plan."

So Polly asked her people—
And they were not a few—
Papa, mamma and brothers,
And all her little sisters, too.
These brought their little children,
A laughing, romping crowd—
And, in their after-dinner speech,
Banks really felt quite "proud."

Yet through it all a shadow
Into his bosom stole;
He knew that bills were coming in;
They paralyzed his soul!
He knew that Mother Pippling
Was whispering good advice
In Polly's ear, and, somehow,
That wasn't very nice.

He knew the romping children
Had done him damage dire
(For Banks had dainty furniture
As any could desire);
But still the guests were merry;
The dinner went "off well,"
In spite of many vexing things
Which one don't care to tell.

And when, at last, 'twas over,
And every guest gone home,
The tumbled house quite still again,
And resting-time was come,
Sweet Mrs. Banks said, cheerily,
"My dear, how kind of them
To come to us! Though mother"—
(Banks softly coughed "Ahem!")

"Yes, mother noticed, bless her!—
One slight omission, dear;
She said Thanksgiving dinners
Without one 'thank' were queer,
I know you don't say grace, dear;
But don't it seem to you
That to give thanks at such a time
Is what one ought to do?"

He fell into a reverie:
"You're right!" he sighed at last;
"Thank Heaven, the thing is over;
They're gone, and all is past!"
And so, in simple language,
By that good husband Banks
The grand Thanksgiving dinner
Was crowned by hearty thanks.

[*Ohio State Journal.*

WEAKER THAN A WOMAN.

CHAPTER XX.

A CRUEL day dawned for Felix Lonsdale—a day when the sun shone so brightly and with such heat that grass, flowers, and leaves withered beneath his fervent rays, when a golden haze seemed to lie over the land, and the brooks ran slowly over the pebbles beneath them—a day when the wind was still, and not the faintest whisper of a breeze stirred the leaves or blossoms—a cruel day. He remembered it all through his life, for the warm sunlight seemed suddenly to change into a fire that burned him, everything bright and fair appeared to wither before his eyes. It was a day which brought him a pain that never quite left him while life lasted.

He was in his office in the High Street—the office that had once borne such signs of prosperity—where the great iron safes had been filled with deeds, and huge bill-files had been loaded with documents—where the tables had been strewn with papers and letters—where busy clerks had passed the day, all too short for the work they had to do—where people were always going and coming with the air of having important business on hand.

It was all so different now. One by one clerks had gone—there was nothing to do. One by one the neighboring squires and farmers had withdrawn their business from the old office. There was so little to transact now that Felix could manage with one clerk. Still he had hope. He felt sure that in time this state of things must improve. When people began to think calmly, they would know that his father was innocent of that which had been imputed to him.

Felix was seated in his office. It was too warm for business—no one came in. There were no messages, no interviews—he had nothing professional to do. The clerk was busy copying a deed, and Felix was making the most of his time by writing an essay upon the "Inequalities of British Law."

Suddenly the postman's knock was heard in the quiet street, where on that scorching day even the very houses seemed to sleep. The sound did not interest Felix; he expected no letter. Violet seldom sent him a little note; when she did so, it was like the finest cordial to him—he worked the better for it,—he was happier and brighter. Perhaps, if she had known how happy those letters made him, she would have written oftener.

Presently, to his surprise, came the sharp, sudden knock of the postman at his own door. The clerk quickly disappeared, and then returned and placed a letter in his hands—a lady's letter, with a faint odor of violets. He opened it and looked at the signature—"Martha Haye."

It was from Violet's mother. What could she have to say to him? It was an invitation probably. He put aside his essay, and began to read the note.

"MY DEAR FELIX:—That which I have to say will pain you, I know; but I cannot help it—it must be said. The engagement between you and my daughter must come to an end. The circumstances under which I gave my consent are quite different from those subsisting at present. Your prospects have quite altered. If you marry my daughter now, you cannot keep her in anything like the position in which she lives even at present; and I am not willing to see her become a mere domestic drudge. Mr. Haye and myself wish the engagement to end at once, as under no circumstances could we consent to the marriage. Violet sends her love, and desires me to say that all this is written by her wish, and that she hopes always to be your friend. She is going away on a long visit to one of her relatives. Hoping you will see the necessity for this step, I am yours very sincerely, MARTHA HAYE."

He read it through, at first with a feeling and conviction that it must be a practical joke, then with a deadly assurance that they were going to take Violet from him. The handsome worn face grew deadly pale; a dazed dim look came into his eyes; a great tearless, voiceless sob rose to his lips; the sunlight seemed to change to a blood-red mist, and the sound like the roar of distant waters filled his ears. He sat with the letter open in his hand, dazed as a man who had received a terrible blow.

How long he sat he never knew; it seemed to him that years of agony, years of torture, rolled over his head. He was literally stunned. He had borne all his sorrows with a brave strong heart because he had a true hope, a beautiful warm love. To take that from him was to leave him with no ground to stand on.

Slowly thought and reason came back to him. He rose, still with the open letter in his hands, with a white set look on his handsome haggard young face which might have touched a heart of stone. He took his hat from the stand, and the clerk looked after him with a terrified gaze, wondering what could have happened to him.

"There was bad news in the letter," he said, "but where has he gone with it open in his hand like that?"

More than one person whom Felix Lonsdale met asked themselves the same thing, more than one spoke to him; but he did not hear—he walked on, looking straight before him, his eyes fixed on vacancy, his white set face without change or expression, until he reached the Limes. What he suffered as he passed the old land-marks, the trees, the stiles, the lilac-bushes at the gate, was known only to Heaven.

He went straight into the house, and Mrs. Haye herself was the first person that he met.

She was half frightened when her eyes fell upon his face; so unlike was it to any face she had ever seen, so changed by his great woe, she could hardly recognize it. She held out her hand to him with some commonplace words of welcome. He did not hear them.

"Come in here," he said; and, taking her arm, he led her into the nearest room. "Tell me," he asked, "did you write this?"

There was nothing to be said but the truth, yet in all her life Mrs. Haye had never been more frightened. She had to deal with a desperate man.

"Yes, I wrote it, Felix; it was wisest, kindest, best."

"And you say that Violet is willing—that Violet knows about it?"

"I wrote it with her express sanction," she replied.

"It is false! I would not believe you if you swore it! I will not believe it! Heaven is not so cruel!"

"There is no cruelty in it," said Mrs. Haye; "it is what must be done."

"Must be done! Do you know that she is my life itself, that I have no life apart from her, no hope that does not begin and end with her? If you take her from me, you leave a dead body—she is my soul itself!"

He paused, for the passion of his words overcame him. How was he to tell this woman what Violet, his beautiful love, was to him? How weak and impotent words were!

"I know that you are very fond of her," Mrs. Haye said gently; "still it cannot be—it cannot indeed."

"Will you tell me why you have done this cruel deed? What is your motive?"

"Because you cannot afford to marry; you must not burden yourself with a wife."

"Surely I know best. I can work—I do work. I would work night and day, with one hope before me of making my darling my wife. She loves me, she knows what trouble has come to us, she is willing to wait a few months longer, and then to share my lot. It will be brighter in time; everything will come right for us yet. I have no fear."

"I am not willing, her father is not willing—we see no use, no sense in the best and brightest years of her life being wasted in waiting for a marriage that, when it comes, will be the worst thing that could happen to her. We are not willing; and I tell you frankly that Violet sees matters as we do. She wished me to say all this."

"Do you know what you are doing to me—what you are taking from me? Do you understand," he cried hoarsely, "that you are killing me?"

"I am sorry, of course—it is very hard, I know—but such a life as you offer Violet would kill her."

"I do not believe it!" he cried. "You changed to me when my fortune changed. You were willing enough to give me my darling when you thought that I was the son of a rich man. I shall be rich again in time. I have seen the change in you; you have given me cold looks for kind ones—you have been barely civil where you had been warmly cordial. I understand it—you love Mammon. Wealth, rank, luxury, are more to you than the heart of an honest man. But my darling is not like you, and I will receive the statement you have made from no lips but hers."

"My daughter is not at home, and you will gain nothing from seeing her."

"But you cannot do as you propose; she is engaged to me—she is my promised wife—no man or woman living has the power to break such a bond. She could not break it herself."

"You will find you are mistaken there," said Mrs. Haye. And then Felix saw plainly that it was useless to say more to her—there was something of animosity in her tone. He left her, still holding the open letter in his hand.

"I am sorry for him," said Mrs. Haye, when describing the scene to her husband; "but what can we do? There is one thing that I am really thankful for—he has not the least idea about Sir Owen. I am not nervous, but I do believe that if he suspected what has happened he would kill him."

As Felix left the house to return home, Jennie, a smart housemaid, who had often opened the door for him, and who thought him a noble-looking gentleman, ran after him.

"Do forgive me sir," she said; "but you have always been so good to me, and I know all about it. I am so sorry for you, sir, that I cannot sleep for thinking of it."

He tried to look indifferent, to smile, but he could not; his pride and self-control broke down at these pitying words.

"Tell me what you know, Jennie," he said.

"They have sent her away, sir, so that you should not see her and persuade her. They have kept it quite a secret where she is gone—no one knows—but I stole into her room and saw her trunk addressed to North Alton, and I know that Mrs. Haye has a cousin living at North Alton. She is gone there, sir, and nowhere else."

"Thank you, Jennie," he said; "you have proved yourself a friend."

Jennie would not take the sovereign he offered her, and the sympathy he read in her face cheered him.

"It will be all right when I see Miss Haye," he said. "They have over-persuaded her. She loves me—and I trust her."

CHAPTER XXI.

Felix sent his clerk to Vale House with a note saying that the family were not to be alarmed if he did not return that evening, as he had some important business to transact in a town some miles distant; and Darcy Lonsdale, who was too ill then to feel an interest in anything professional, feebly blessed him as he listened.

"He works hard," said Kate as she read the note; then she sighed, thinking how different matters would have been had Felix loved Evelyn instead of Violet. The Hayes had stood aloof from them in their troubles; they had expressed but little sympathy, and Mrs. Lonsdale felt it keenly. Violet had not been to see them as Eve Lester had been; and Kate sighed again as she thought of the difference between the two girls.

North Alton was quite forty miles from Lilford. Felix knew that the name of Mrs. Haye's cousin was Miss Western. He had often heard Violet laugh about her mother's cousin, who was an old maid. He said to himself that he would go to North Alton by the night train; then he could see Violet in the morning, and be at home again in the evening. He little dreamed that people looked at him earnestly as he went to the station. His handsome young face bore the impress of unutterable sorrow; his eyes were dim and shadowed, with great dark circles round them; his lips were pale and trembling. He had never thought of taking food—he had not even drunk a glass of water to cool his parched lips. So ill, so sorrow-stricken, so unlike the handsome, gallant, noble Felix of the day before was he that Mrs. Lonsdale would hardly have known him had she seen him—he looked like the ghost of himself.

When he stood before Violet she uttered a cry of sorrow and dismay. He had left the hotel to go to her aunt's house, and met her just as, dressed for a walk, she was leaving the little front garden. One of Miss Western's maids was early walking. He waited until Violet had gone some little distance down the road, and then he followed her. She gave a little cry, and stood silent and shame-stricken before him. He saw the sorrow, but not the shame, and the sorrow misled him. The dreadful livid pallor, the stony mask, fell from his face as a snow-wreath melts in the warm light of the sun.

"My darling," he cried, "I knew it was false—I knew that you had not said it! Oh, thank Heaven, thank Heaven!" He leaned, pale and breathless, against the trunk of an elm-tree. "I believed in you, my darling," he said. "I knew that you had not sanctioned it; you could not—you hold my life in your hands. And yet why did you come here? Why did you not write to me? Speak to me, Violet, for by the heaven above me I swear that I am going mad!"

She was frightened, scared, at the wild eyes, the hoarse voice, the face so full of pain. She dared not have said to him—"I have made my choice, Felix, between love and gold." And, wretched as she was, though she had given him up, and never meant to marry him, her whole heart went out to him with greater warmth and greater love than it had ever gone before. She held out her hands to him, but started at the touch of his; they burned her like fire.

"You are making yourself ill, Felix," she said.

"Ill!" he repeated—and his laugh was more terrible to her than any words. "How would you feel, Violet, had any one tried to tear the living, beating heart from your body? Oh, my darling, tell me it is not true—tell me so, for Heaven's sake! Say that it is false—that they persuaded you, urged you, wrote without your knowledge! Speak to me quickly, for I am going mad!"

She was only a woman—at the very best a weak one—and she loved even after the weak fashion in which some women love. She could not endure the sight of his pain. She dared not tell him the truth; she did what weak women so often do—she temporized.

"I thought it best, Felix, to—to give you some years free that you might work the better. I should not like to be a burden to you."

He drew a deep breath, like one relieved from an intolerable load, from an unbearable pain.

"Is that all? Oh, my darling, my generous, noble Violet, is that all? I will not reproach you, but why have you given me this terrible fright? I have been almost dead. I am fifty years older with these hours of horrible pain. Why did you not tell me, sweet, what you dreaded? There is nothing to fear, Violet. I am so strong when I think of you that I could work by night and by day yet never feel fatigued. Such love as mine puts nerve into a man's right hand. Oh, Violet, sweet, you need not fear! You shall have a home as beautiful as love can make it. You shall have a life so easy and so free from care that when it ends you will look back in wonder to see how it has passed. You shall never know pain or fatigue that I can save you from. You shall be served and waited upon and attended to unceasingly."

She made him no answer, but her hands touched his gently.

"A burden!" he repeated. "You were afraid of being a burden to me! Oh, Violet, life of my life, I ought to laugh at you! Sweet burden that I would fain carry until death claims me! Would to Heaven that the time were near when I could make the dear burden all mine!"

Still she had not the courage to look at him and say, "I love you, but I love riches better—I have chosen them instead of you." She had not the courage to say it in that hour. She was frightened even to remember it.

"You will never feel this fear again, Violet, will you?" he said, speaking more like himself than he had yet. "It is so absurd—yet perhaps it is natural to a sensitive mind like yours. I am sane now, but I have been mad. Does my face alarm you? You need only laugh at it, sweet. I have forgotten to eat and to drink since your mother's letter came. The sun was shining brightly and warmly, but it seemed to change all at once into a scorching fireball, and I went mad. Yet I did not lose my faith in you, Violet. I knew that you would never have spoken as your mother did, never have written as she did; I can forgive her; it is only natural that she should think so much of you. No man could seem good enough for you. I am not good enough, but I love you so dearly that my great love stands in the place of great riches or great rank."

Still she uttered no word—she dared not tell him the truth.

"You are strangely silent, Violet," he said. "Have I frightened you?"

"No," she replied; "but you have startled me—you look so ill, Felix, and so unlike your own self."

"No wonder, my darling," he returned. "But I will again—I will remember how sensitive you are."

She looked up with a smile—so sirens smile at the men they lure to destruction.

"Felix," she said, "you should not love me so much, dear—you know what I have always told you about idols of clay."

"I cannot help it; my mission in life is to love you."

"I cannot ask you to come in and see me," she said. "Miss Western does not like gentlemen; she never receives visitors."

"My darling, I must hasten home," he told her. "But you have not informed me why you came here, Violet."

"Mamma wished me to come. I was not quite strong—I wanted a change."

"And why did you not write to me, sweet?" he continued.

She paused one moment. Should she tell him or not? No—she could not; she loved him too much, and she was somewhat ashamed. She found an excuse; there was no need for it to be a very good one to satisfy him.

"I knew you were true to me, Violet," he said. "I knew that it was your mother who persuaded you—who had written that cruel letter without your sanction, perhaps without your knowledge."

"I knew that she was going to write it," Violet told him—but he was not afraid even then. No man is so completely blind as a man in love.

"Then you sanctioned it to try me—you sanctioned it to see how much I loved you? Listen, Violet sweet—I shall go home and work as no man ever did. I shall begin at once to get your house ready for you—I shall wait no longer—and when it is ready, if your mother does not give her consent, I shall run away with you. Do you hear, my darling; I shall do as Jock o' Hazledean did."

She laughed faintly. Even then she had not the courage to say, "The letter was all true, and I have given you up of my own accord." Even then she deceived him by her look and smile, if not by her words.

"I must not stay longer," he said. "I shall go back home a different man. It is a terrible thing to know that one's fate lies altogether in the hands of a single creature; but, when they are such true, sweet hands as yours, Violet, there is nothing to fear. I will go back now to my work, which is sweetened by my love. Darling, say once more for me the words I love so dearly—'I belong to you, Felix.'"

She had always said them before while looking up at him with an arch sweet smile, her beautiful eyes seeking his; now the fair face drooped with a burning flush. She was nervous, weak, and guilty, but not guilty enough to repeat those false words.

"I am afraid Miss Western will find you here, Felix," she said; "if she does, she will send for mamma."

"Are you so closely guarded, my darling?" he laughed. "Ah, well, never mind! It will not be for long. I shall hasten home; I shall prepare your house; and when it is ready I will take you if all the world should try to prevent me, for you are my own. I shall go home happy because I trust in you and believe in you. I shall never believe that you have changed to me until you tell me so yourself. Good-by, my darling love of my heart—good-by!"

She watched him as he went down the high-road, and the impulse was strong upon her to call him back and say to him that she had given him up—that the life of love and struggle that he offered her had no charm for her—that she had weighed both, and had deliberately given the preference to wealth—that he must go home and learn to forget her.

She knew that she was in honor and in conscience bound to tell him this, but she did not. She watched him as he walked down the high-road, knowing that he went away with a sense of hope in his heart that was hereafter to cause him only more deadly pain. The wrong that she did him in letting him leave her with the truth untold was as great as the wrong she had done him in breaking her plighted troth.

CHAPTER XXII.

Felix was at rest for a short time. When he grew calmer and thought more carefully about Mrs. Haye's letter, he ceased to feel any great surprise. Mrs. Haye was, he knew, a worldly woman, and nothing was more natural under the circumstances than that she should cease to care for her daughter's marriage with him. But, with the hope that had sprung up afresh in his heart, it seemed to him that his strength and his energy had no bounds, that he could work as no one had ever worked. Violet was the mainspring of it all. If he lost her, he knew that he should never care to do another hour's labor. He began afresh with such zeal, such energy, such industry and perseverance, that every one wondered at him. He let them wonder—he knew why he was working.

And, while he was counting the hours, trying to turn each one into gold, Sir Owen was busy too. He had come to a perfect understanding with Mr. and Mrs. Haye. He told them that he would cheerfully give half his fortune to make Violet his wife. He had asked them to help him, and had promised them their reward. Mrs. Haye went on a short visit to her cousin, and was dismayed to hear from Violet that Felix had been to see her—that he had gone back home with the hope that all was right.

"Why did you not tell him the truth, Violet?" asked Mrs. Haye sternly. "It was cruel to deceive him further."

"I could not, mamma," she replied, her eyes filled with tears—"he looked so ill and unhappy, I could not."

"It was cruel kindness, Violet," declared Mrs. Haye; but she said no more, knowing that, in her daughter's place, she should have done the same thing.

It was arranged that Sir Owen should go down to North Alton and renew his offer of marriage. If Violet consented, the marriage must take place, Mrs. Haye said, in London. If they were married at Lilford, Felix Lonsdale was quite capable of going into the church and taking the bride from the altar. She was sorry for him, and she felt that it would be needless cruelty for the marriage to be celebrated just before his eyes. "It will be hard enough," she said to herself, "without that."

So all was arranged as she desired. Sir Owen went to North Alton, and the beautiful fickle girl who had loved Felix Lonsdale and given him up plighted her troth to a man she did not love—plighted it because he was rich. He had taken with him a magnificent diamond ring, which was to be the pledge of their engagement; and, as he placed it on her finger, he looked wistfully into her face.

"You care for me a little, Violet, do you not? You are a cold bride, after all, for a man to win. If I thought you really liked that lawyer better than me, I would not ask you to marry me—upon my soul I would not! I give you all I have—my love and my fortune. Surely you have a smile and a kind word to give me in return."

No wonder that he spoke in that strain to her. She was too weak ever to be a great sinner—too weak to sin and forget her sin. It looked her in the face now as she stood with the light of the Baronet's eyes upon her, the diamond ring on her finger, contrasting the wooing of her two lovers, and knowing full well which was best.

"Am I not kind?" she asked with an exquisite smile—a smile that pleased him so that he clasped her in his arms and kissed her.

When he did so, she wished herself dead. She said to herself that she could not go through with this new engagement; that she must let the wealth, the rank, the title pass; that she must give all up and go back to Felix. She loved Felix, and she did not, nor would she ever, love Sir Owen.

She had a few minutes for these reflections; and then he was telling her of the future, of all she would enjoy—how people would envy her, and what a position she would take in the great bright world. She listened, for the words were pleasant, and forgot her pain.

To Felix Lonsdale there came strange rumors, but he would not believe any of them. He had implicit faith in Violet—implicit trust. Until she told him that she was false to him, he should not believe one word to that effect.

One morning he received two letters. One was from Violet, and it said—

"Try to forget me, Felix. I have never been worthy of the great love you have given me; I am not worthy of it now. Try to forget me; for I have been thinking it all over, and I can see that our engagement must be broken. You said you would believe it when I wrote it. Believe it now, for I say that it must end. In the years to come we may be friends—never anything more." "VIOLET."

He read it with unbelief. Some one had compelled her to write it; it had not been done of her own free will—of that he was sure.

The second note was from his humble, faithful friend Jennie, the pretty housemaid, written with many apologies for the liberty she had taken; but she wanted him to know that her young lady would be at home at the Limes that night, on her road from North Alton to London. Her master and mistress were going to London with Miss Violet, she added, and she was afraid there was mischief on foot. It was her own private opinion that they had persuaded Miss Violet to marry some one else. If he went to the Limes late that evening, she would keep the entrance gate and the garden gate open, and she would manage that he should see Miss Haye.

He read both letters through, but he did not lose his reason this time. A calm settled despair came to him, against which he struggled blindly; he could not believe that his love was false even though he read it in her own handwriting. He would not believe it unless she told him so herself—anything was more credible than that she should have deceived him and broken her word. When he believed that, he said to himself, the heavens would fall. Whom could she be going to marry? How absurd! How ridiculous! He had never heard her name mentioned except with his own. He knew that she had many admirers, but who would dare to speak of marriage to her when it was well known that she was engaged to him? He could well understand that it was Jennie's own sensitive care and anxiety for him that had led her to make the mistake.

He would go however and see Violet, and hear from her what it all meant—but not at night—certainly not when it was late, as though he were afraid of being seen. He was her betrothed lover, she was his promised wife. He would go up to the front door in the broad daylight and ask to see the girl who had promised to marry him. Suddenly he remembered that, if he did so, he must betray Jennie. Violet's return had been kept a secret, and the family would at once suspect her of having betrayed it. Another thing had occurred to him—if they did not wish him to see Violet, and he went in a straightforward, honest way to ask for her, they might, and most probably would, refuse to let him see her; they would invent some untruth or other, and, if she were really going to London, he should miss the only chance he had of seeing her. It was humiliating and mortifying, but he must act as Jennie proposed; he had no other resource. He would go that night and see Violet.

Again he wrote home to say that he should not return until late; and Kate's kind eyes filled with tears as she read, thinking of how hard he was working, and her heart misgave her that it was all for nothing—that the prize he was laboring and waiting and hoping for would never be his. She had heard of Violet's absence from home, and her quick mother-wit had soon told her that of that absence Felix knew little or nothing. She drew a bad augury from that. It boded mischief to him, she felt sure. She was compelled to content herself with the thought that she would sit up for him and attend to his comfort when he did return.

Felix went. He hated himself for going at night, when no one could see him—for seeking a clandestine interview with his promised wife. The night was dark, and the wind blew cold. It was after nine when he reached the entrance gate. He found it open, and Jennie waiting for him inside.

"You will not be angry with me, sir, will you?" she said. "But it seemed to me almost as though some one were being killed. I am quite sure they have persuaded my young lady to marry some one else. I heard her crying bitterly this evening."

But Felix could not discuss the subject nearest to his heart even with this faithful, humble friend.

"Do you think I shall be able to see Miss Haye, Jennie?" he asked.

"Yes, sir. I will give her a message that in a few minutes will bring her down here to you. She will not be angry with me." And in a few minutes she had kept her word.—To be continued.

THE SECRET MARRIAGE.

S. A. F.

To say that Harvey Frothingham was in a bad temper was to put the mildest form of words to express the savage mood in which he found himself one winter's evening, as he shot through the main street of the town of L——, on his way homeward. Everything had gone contrary to his wishes all the week.

To commence with, he had fallen in love with Josephine Ormund, whose pretty face was her only fortune, and who worked in a paper-box factory for her daily bread.

Entirely ignorant of the fact that Harvey Frothingham was a man of standing and wealth in L——, pretty Josie allowed the minor facts, that he was insultingly free in his addresses, to influence her so strongly, that her dignified reserve taught him the lesson he needed, and when he sought her for his wife she refused the honor.

"As if, by Jove!" the angry man meditated, "I was only a hod-carrier."

To add to this discomfiture, the heiress, Miss Maude Chesterton—whom he had held in reserve, that his ambition might win a wife if his love would not—had coolly informed him that she was engaged to Fred Holman.

Now, if there was one man above another who was utterly detestable in the eyes of Harvey Frothingham, it was Fred Holman.

They had both been rivals at school, where both stood well in talent, application and social position; and Fred was ever a little in advance in every study, carrying away the contested prizes far more frequently than it suited Harvey he should.

In society, Fred's handsome face, ready wit, courteous manners, and frank, sunny temper, kept him ever in higher favor than Harvey Frothingham's sullen, cold disposition could gain.

And now, when Maude had been ever gracious to the son of the wealthy banker, Silas Frothingham, she answered his love-suit by the tidings that his life-long rival had won the promise to be his bride.

"And the worst of it is, it will be just the match to suit his uncle," muttered Harvey, savagely. "No fear of him disinheriting Fred now."

For Harvey knew that Fred depended entirely upon the good-will of his mother's brother, James Rutherford, a wealthy and eccentric bachelor, for his income. He had been left an orphan when a mere boy, and his uncle had adopted and educated him, and would probably make him his heir.

But the bachelor, having long ago put away sentiment, if he ever felt it, looked to Fred to make a match that would increase his fortune and social position. It was the wish of his heart to see Fred the husband of Maude Chesterton, and his wish was to be fulfilled.

Harvey Frothingham, at odds with love, would like to see his rival refused, disinherited, humbled as he felt himself humbled, since neither love nor money would accept him.

He strode over the pavement in a savage mood, and started suddenly to see Josephine Ormund coming out of a shop a few steps in advance of him. In her hand were several small packages, and her face was pale and anxious.

In a moment Harvey was at her side.

"Let me carry some of your parcels," he said, lifting his hat as he spoke.

"Thank you, I have only a few steps to go," answered Josie, hurrying forward nervously.

"You need not be afraid of me," Harvey said, noting her nervous manner. "I will not annoy you! Why will you not believe my respect is as great for you as my love?"

And before he knew exactly where his words were leading him, the young man was renewing the offer he had made before.

At the door of a small lodging-house Josie stopped and faced him.

"You have spoken so before, Mr. Frothingham," she said, gently; and because I believe you are sincere, I will tell you what I have kept secret for six months; I am already married!"

"Josie! Be quick! Why do you stand there?" cried a voice in the narrow hall-way, and a man stepped into the bar of light thrown across the open door by a street lamp.

"Fred Holman!" muttered Harvey, starting forward. "Married! and to Fred Holman!"

It almost consoled him in his own disappointment to think of the hold he had upon his rival. Engaged to Maud Chesterton, and married to Josie Ormund! Fancy the proud face when she knew she had been deceived for a girl who worked in a factory. And sweeter still was it to Harvey Frothingham to think of the wrath of James Rutherford when the news reached him.

But in his triumph Harvey Frothingham had resolved to be very cautious, to have strong proof of his rival's marriage before venturing to accuse, to either his uncle or his betrothed.

He had noticed the number of the house in the glare of the street lamp; "No. 28, Ralph Street."

This was the entry he made in his note-book, in case his memory proved treacherous.

It seemed as if fortune favored his plans.

Only the next day, happening to go into a large fruit-and-flower-shop, he saw Fred Holman selecting the contents of a large fancy basket of choicest fruits and rarest blossoms.

Nodding carelessly to Harvey, he wrote the address upon a card, and attached it to the pretty basket.

"You will send this at once," he said, and then left the shop.

And Harvey, taking the place Fred had just vacated, read the card:

"Mrs. F. Holman, No. 28 Ralph Street."

What proof was needed now? It was not in the nature of Harvey Frothingham to work openly in any scheme. A blow in the dark suited him better. Feeling sure of his position now, he hurried homeward to write two anonymous letters, that would, he fondly hoped, disinherit and utterly confound his long successful rival.

One of those venomous missives found Maude Chesterton in her pretty boudoir, trifling with some embroidery, and dreaming sweet dreams of her love and Fred Holman's sweet devotion.

She was a handsome, dignified girl of nineteen, full of all womanly sweetness, unspoiled by her great wealth.

She loved Fred Holman with the whole strength of her young heart, and she was sure that her love was returned.

With the divine intuition of true love, she knew that if she were beggared or deformed Fred would love her still the same.

Not for money had he sought her for his wife, not even to please his uncle. He loved her.

The dainty work under the slender fingers progressed but slowly, as Maude lay back in her deep arm-chair, looking into the glowing fire, and building castles of future happiness.

From this tender reverie she was aroused by a servant, who handed her a squarely-folded letter, awkwardly addressed, and fastened with a wafer.

Wondering who her unknown correspondent could be, she opened the paper. The same straggling hand inside met her eyes. Only a few lines were written:

"If you would have a proof of the falsehood of one you believe true, go at eight o'clock this evening to the second floor of No. 28 Ralph street, and you will find Mr. Frederick Holman and his wife!"

"Anonymous!" the proud girl said, her lips curling and her eyes flashing. "It is a falsehood!"

She threw the note upon the coals as she spoke, and watched the flames curl and blacken the paper till it flashed out of sight up the chimney.

Then, with all the color stricken from her face, she took up her embroidery.

Had Harvey watched her then, he would have thought that that poisoned arrow had missed its aim.

But it was not so. The work was thrown aside, the piano rang out under the restless fingers, a novel was opened, a room was put in order; but while the calm face betrayed no secret suffering, the girl was tortured all day by the words of the anonymous note:

"Frederick Holman and his wife!"

Could it be? Had the frank, brown eyes that had looked so lovingly into hers, mirrored only a false heart? Was she, indeed, so far deceived?

Long before eight o'clock Maude Chesterton had resolved to prove or falsify the words that seemed burned upon her brain.

Surely, of all the world she had the best right to test the truth of such a monstrous charge against her betrothed lover.

And while she was striving to hide from any eyes the tortures she endured, James Rutherford was storming up and down his library, holding the second of Harvey Frothingham's communications in his hand.

In the same awkward handwriting, the same facts were stated, the same hour and place to verify the writer's words.

But the peppery old bachelor made no secret of his wrath. To have listened to him, one would have supposed that making mince meat of his disobedient nephew was the least he intended. He called him all the pet names suggested by a furious rage; he used up all the abusive adjectives in the dictionary to describe Mr. Frederick Holman.

He exhausted every threat that he could devise; long before eight o'clock he had wrought himself up to a rage that was frightful to witness.

It was with a chuckle of satisfaction that Harvey Frothingham, secretly hidden in a narrow courtway, watched a tall stately figure leave a carriage at the head of Ralph Street, and walk to the door of No. 28.

In the quiet of the street he heard a clear voice ask the servant who opened the door:

"Does Mrs Holman live here?"

"Yes, ma'am second floor."

"Is her husband at home?"

"Oh, yes, ma'am; you'll find them both there."

Then Maud Chesterton entered the house, just as a short, panting man flashed up the steps, and, not pausing to make inquiry, also entered.

In the passage, Maude Chesterton, turning, as rapid steps followed her, faced James Rutherford.

"You here!" he said. "You have heard too, then, of the trick this ungrateful hound has played upon us?"

"I have heard," she answered, in a cold voice, "that your nephew's wife lives in this house. I wish to ascertain if it is true."

"We will soon see!—we will soon see! Second floor. Here we are. Now, then!"

And the old gentleman's raps proved the excitement under which he was laboring.

A very pale, sweet woman opened the door, her eyes showing that she had been weeping very recently.

"Does Mrs. Holman live here?" the old gentleman asked.

"That is my name, sir"

"Can I see your husband?"

The soft eyes, full of deep trouble were lifted.

"Is it on business, sir?"

"Very important business," was the rather dry response.

"Because the doctor said to-day he must not have any mental excitement. He is so very much worse to-day; I—I am afraid he is dying!"

And sobs broke out again.

"Dying!"

Maude Chesterton reeled into the room, and sank dizzily upon a chair.

James Rutherford, with a face white as death, said: "Dying! An accident?"

"No, sir; it is a fever from over-work."

"Fever—over-work!"

"Josie—Josie!"

If ever Fred Holman spoke, he spoke then from an inner room, and the little wife, seeming to forget her strange visitors, answered, quickly:

"I'm coming, Fred."

She went at once to the room from which the voice came, and again the two, listening intently, heard Fred's husky voice.

"Bring the last cordial, Josie. Ten drops! I am sure he knew me; but he is faint."

A moment later the same cheery voice spoke again: "Drink this, old fellow. So! See, here is Josie! Don't you know Josie?"

Then another voice—oh! so very faint!—said: "Josie—little wife!"

A moment of utter silence followed, and then Josie said:

"There is a gentleman and lady in the other room, Fred, who want to see Frank. Will you see them?"

And Fred, appearing in compliance with this request, found his uncle vigorously fanning Maude Chesterton with a newspaper to bring her out of a fainting fit.

Before he could frame a question, his uncle said, quickly:

"Get me some water!" And he obeyed.

Then, as Maude's blue eyes opened with a bewildered stare, the old gentleman continued:

"We were sent here to see your domestic felicity, and we seem to be misinformed."

"My domestic felicity!" cried Fred.

"Read that," said his uncle, handing the anonymous note. And Fred complied.

"Humph! yes," he said. "So you came to see Mrs. Frederick Holman. Well, that lady has made me a happy man;" and his eyes flashed merrily upon Maude. "But I will introduce you to my cousin's wife, Mrs. Frank Holman. Maude," he continued, with a gentle gravity, "since you have come here, it will be an act of Christian charity to remain, for"—and his voice sank very low—"we are afraid the poor little woman will be a widow before the morning."

"Poor fellow!" said James Rutherford. "What is the trouble?"

"Over-work. He thought he could increase his small salary by toiling over fine engravings in the evening, and he broke down. I never knew of his marriage till last week, when he wrote me a painful note, begging me to care for his wife if he died. I came here at once, and was fortunate enough to win poor little Josie's sisterly confidence and affection. Maude, if the great trouble we fear comes—"

"I will be her true sister, Fred!" interrupted Maude.

Here was a deep silence of several minutes, then Josie, very pale still, crept softly into the room.

"He is asleep!" she whispered. "The doctor said if he slept he would live!"

And when she broke into hysterical weeping, Maude held her close in loving arms, whispering that she must let her stay and comfort her, for Fred's sake.

Nearly eleven o'clock came, and still Harvey Frothingham waited, half-frozen, in the dark courtway, to see the discomfiture of his rival. Then his patience was rewarded by seeing Fred and his uncle come out of No. 28, arm-in-arm, evidently the best of friends, and enter Miss Chesterton's carriage, and drive away.

Not until the day of the wedding, when he saw Josie an honored guest, and was introduced to Mr. Frank Holman, did Harvey Frothingham understand the slight mistake he had made.

RECENT LITERATURE.

The Temperaments, or The Varieties of Physical Constitution in Man, considered in their Relations to Mental Character and the Practical Affairs of Life, etc. By D. H. JACQUES, M. D., with an Introduction by H. S. DRAYTON, A. M., Editor of the Phrenological Journal. 12mo, 350 pages, 150 illustrations, extra cloth. Price $1.50. New York: S. R. Wells & Co., Publishers, 737 Broadway.

A work treating of a subject that should be of universal interest, as it is of very great importance. The temperaments are defined according to both the ancient and the modern theories and classifications. The pathological views of the old medical schools are fully described, as well as those of the more recent anatomical and physiological systems. The writer discusses all the temperamental modifications and combinations usually met with, showing the configuration which is associated with the different types. The relations of temperament to occupation, marriage, education, training of children, choice of occupation, health, and disease, are entered into. An important and valuable feature is that of the practical hygienic rules for correcting the unhealthful predispositions of certain temperamental conditions; and not the least interesting part of the book is that which is devoted to the temperaments as they appear in races and nations, and is illustrated with many portraits. Then there are studies in temperament, and a chapter on the temperaments in the lower animals, showing the effect of domestication and other conditions.

The book in size and style is such as is usually sold for $1.50, but is offered in connection with a year's subscription to the Phrenological Journal, which is only $2. It must, we think, be specially acceptable to the subscribers, as it is in entire keeping with the objects of that publication, yet in itself forms an independent volume of a most attractive and useful sort.

MAGAZINES.

THE POPULAR SCIENCE MONTHLY for January 1879.—The enlargement of The Popular Science Monthly, announced to begin with this number, is quite as apparent in the variety as in the extent of its contents. The first article, on the Traces of an Early Race in Japan, is by Prof. E. S. Morse, who is at present lecturing in the University of Tokio, and investigating Japanese archæology and natural history. In the next article, on Virchow and Evolution, Prof. Tyndall discusses the famous address of the distinguished German doctor, on The Freedom of Science in the Modern State. Astronomical Magnitudes and Distances, by Prof. H. Corbart, is an exceptionally successful attempt to convey to the average reader some idea of the vastness of heavenly spaces. The Beginning of Nerves in the Animal Kingdom, by Geo. Romanes, is a very clearly written and interesting article. Pope and anti-Pope is a trenchant comment by Prof. Carl Voght, on the fight in Germany between the "Medical Pope" Virchow, and the "Zoological Pope," Hoeckel, over the subject of Darwinism. Black Diamonds by Maury, is an entertaining account of the early discoveries of coal. Following is a readable illustrated article on The Devil-Fish and its Relatives. But the paper of the number, both for interest and importance, is thereafter by Geo. Iles. The Scientific Relation of Sociology and Biology, The Physical Functions of Leaves, Curari or Woorara Poison, Molecular Dynamics, Effects of Alcoholic Excess on Character, and a Sketch of Gustav Wallis, make up the contents of the body of the number. Beside the fifteen articles enumerated there are editorials on Protection and Socialism, The Religious Recognition of Nature, and Improved Domestic Economy.

THE SATURDAY MAGAZINE, a new applicant for public favor, is edited by F. B. Perkins, and published in weekly numbers of 32 large octavo pages, at 11 Bromfield St., Boston, for $3.50 a year.

We judge, from what we have learned of this magazine, its pages are intended to give a variety of literature that will furnish to every member of an intelligent family, food for thought, as well as a store from which to draw instruction and amusement. Each number is to contain carefully made selections of both prose and poetry from the best foreign publications, interspersed with original items, editorial remarks, notes and queries, and other things needed to make the magazine rich, racy and attractive. Brevity is one of its rules, although we see indications that parts of one continued story may be expected in each number. We are told a tree is known by its fruit, but it is not always necessary to wait for fruiting time to predict what will result from oak, apple or chestnut trees; nor do we, from our knowledge of Mr. Perkins, the editor of this magazine, feel obliged to delay our judgment as to its value and success, nor have we any hesitation in giving, as our belief, that he will make it all that is promised—intelligent, versatile, lively, thoughtful, witty, experienced, and in every way adapted to cater to the literary public. We shall be disappointed if he does not make for the Saturday Magazine a place among the most popular publications of the day.

"A Spool of Thread and How it is Made," is the title of an illustrated pamphlet issued by the Willimantic Linen Co., of Willimantic, Con. The article was prepared by C. H. Clark, of the Hartford Courant, and originally appeared in Scribner's Monthly. Until this article is read, one would never imagine the extent of the interest that may be spun about a simple spool of thread, nor the intricate and interminable machinery used in its production. It is a chapter freighted with curious information and well worth reading. We presume the Company will send it free to any applicant.

THE Messrs. Burnett issue a very pretty price list that contains an explanation of the language of flowers and other interesting information. Its distinctive feature is the handsomely decorated and illumined covers in the Egyptian style. Something quite novel and attractive.

J. E. MILLS' Traveling Expense-Book is a very clever idea, undoubtedly suggested by experience. It is a systematic itemized record of all daily expenses, put in such shape as to remain a record after the pages are filled. One book contains memoranda for thirty days. Spring & Robertson, Lafayettte, Ind., are the publishers.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

DON'T MARRY A MAN TO SAVE HIM.

SARAH K. BOLTON.

A CRY comes over from Oregon
For a car-load—not of women wan,
But of women of brain and blood, and ton?—
"Come, marry these men to save them!

"There are thousands here in these haunts of sin
Spending their money in game and gin,
Corrupt without and corrupt within;
Come, marry these men to save them!

"They have been somebody's pride and joy!
Somebody's petted and pampered boy;
Spoiled for lack of a maiden coy;
Come, marry these men to save them!

"You must be healthy, and pure, and strong,
Alike to breast and bear the wrong,
Willing to carry a burden along;
Come, marry these men to save them

"You must be leader, but always seem
To be gentle and helpless as love's young dream,
And leaned upon when you seem to lean;
Come, marry these men to save them!

"You must be cleanly, and kind and sweet,
Making a path for their godless feet
Up to the grace of the mercy-seat;
Come, marry these men to save them!"

Oh! Woman, you're sold at a fearful price
If you wed your virtue to a chance device;
And trust your soul to that of vice:
Don't marry a man to save him!

A life that is pure needs a pure one in turn,
A being to honor and not to spurn,
An equal love, that shall constant burn;
Don't marry a man to save him!

A woman's life is a precious thing,
Her love is a rose unwithering,
Would you bury it deep in its early spring?
Don't marry a man to save him!

You can pray for his soul from morn till eve,
You can win the angels to bring reprieve
To his sin-bound heart; but you'll always grieve
If you marry a man to save him.

God gives to Woman a right to press
Her claim to a man's best manliness;
A woman gives all, should a man give less?
Don't marry a man to save him!

[*Woman's Journal.*

THE WOMAN'S CLUB.

A NEW AMUSEMENT.

DEAR FAITH RIPLEY.—I want to tell you of a very enjoyable time we have had in a (to us) new kind of social gathering.

We have (like many other of your rural friends doubtless) worn out the Old Folks' Tea-party, where some one is sure to be mortified by ripping a borrowed heir-loom brocade or bursting a slipper of the previous century; The Pound Sociable, too, has lost its interest in these economical days, when brown soap, corn meal, washing soda, white sand and salt compose the contents of most of the tastefully arranged parcels exposed for sale; while in amateur dramatic performances or concerts some one or some talent is apt to be slighted and the pleasure thereby diluted. It is therefore a matter of rejoicing when an entertainment that is democratic, inexpensive and a pleasant tax upon ingenuity, is introduced.

I will try and give you an account of our

VEGETABLE TEA PARTY.

You would have been surprised and delighted at the numerous devices, tasteful and comic that were suddenly developed for the occasion. Those having charge of the entertainment had engaged the town hall, on the platform of which were seated the so-called King and Queen of the vegetables in grotesque regal costumes. The queen was dressed in a robe of pale green and black, and over her shoulders was thrown a scarlet cloak, trimmed with cotton-batting ermine. A pumpkin crown and a popped-corn necklace with three small mock orange pendants completed her costume.

His Royal Highness was gorgeously arrayed in a crimson robe embroidered with gold, that looked suspiciously like a piano cover belonging to one of the ladies present. His crown was composed of the same precious vegetables as the queen's.

The subjects bearing offerings of the vegetables they were dressed to represent, were presented to their Highnesses and after making obeisance, and depositing their offerings and the baskets made of pumpkins or squashes, which contained them, at the feet of their sovereigns, retired from the stage.

Flora and Pomona of course furnish us with many lovely hints, and the heart of the agriculturist would have been gratified by the artistic display that the simple products of the soil afforded.

Without taking up too much space in describing separately the decorations of a host of counts, countesses and other titled people, I may speak of dainty bonnets made from red, green and white cabbage leaves, ruches from the nature-crimped kale, and cuffs from ripened corn-leaves. The brunettes revelled in the adornment of red peppers, while parsley festoons suited the blondes. Pumpkin seeds served magnificently for trimmings and watch chains, popped-corn and carrots came into play for earrings, while elaborate necklaces, crosses and pendants of carrots and turnips made a quaint display.

These articles were also utilized for illuminated letters that formed the mottoes around the room.

After the opening entertainments of the evening was over, the audience was invited to partake of a vegetable supper, the entertainers transforming themselves into waiters and waitresses and attending to the wants of those at the table.

Many attractive features may be added to an entertainment of this kind, such as good singing tableaux, charades, etc. We had on the stage at one time a pantomime, showing an old-fashioned kitchen with an old lady spinning, another knitting, a real baby in a cradle, a young girl paring apples, a dairy maid churning, while an old man sat on a bench trying hard to mend an antiquated boot.

An old fashioned clock that struck while the pantomime was in progress added much to the effectiveness of the scene. E. C. G.

STUDY AT HOME.

WHEN looking over the departments devoted to women, in the RURAL, I feel inclined to ask, "Is not the life more than meat and the body than raiment?" One would suppose not, judging from the amount of space allotted to fashions, fancy work and recipes for cooking, and the absence of contributions which would tend to stimulate readers to mental effort. It can hardly be that the women who live in the country are satisfied to allow food and clothes to fill their lives to the exclusion of mental and spiritual interests, and yet when a club is opened for them in the RURAL, and they are invited to discuss in it any and every matter which is of interest to them, what do we find the leading topic, at two or three meetings of the club?

DISH-WASHING!

Not, how can or shall we improve on old methods, but, mere recordings of personal feelings about the occupation. One writer informs the Club, that from her youth up she has doted on dish-washing, another, takes an unnecessary amount of space to divulge the startling fact of her utter abhorrence of the process. How entertaining and instructive!! If dish-washing and the making of rag-carpets engross the time and thoughts of the majority of the RURAL women, I trust there is at least a small minority who will be interested in hearing a little about the Boston Society to Encourage Studies at Home. The ladies who first conceived the thought of this association, wished to ascertain by actual experiment whether or not it was practicable for women to make an advance in learning, without the adventitious aids furnished by the class system, without the stimulus of rewards and even without the excitement of a competitive examination.

The rules of the Society are extremely brief. They stipulate that students must be at least seventeen years old, must devote a certain time to their work, each day or each week, and must pay an annual fee of $2 to cover the expenses of postage, printing, etc. Any lady wishing to become a student can obtain a programme of studies of the Secretary, No. 9 Park street, Boston, and having selected from it the branch or branches, which she wishes to pursue, will receive the special directions for that course. Memory notes, monthly reports and examinations by correspondence are the principal ways of testing the information acquired and at the close of the course each student prepares an essay. History, Natural Science, Art, German, French and English Literature are the six courses in the programme. The students live in all parts of the republic. The great majority are in out-of-the-way places, in which the few persons of studious tastes are lonely, and regard the Society as their deliverer from idleness or ill-directed work. Certain books are recommended in each course, and when the pupil cannot obtain them for herself, they are lent to her from the Society's library, which includes 490 volumes. I would advise all women who can snatch one hour a day from their work to become members of this Society. Try it, my friends, and see if you do not derive more satisfaction from having a thorough knowledge of some branch of literature, science or art, than in knowing the latest stitch in embroidery, or how to make indigestible novelties in pastry. FREE LANCE.

WHY MUST ALL WOMEN KNOW HOW TO SEW.

To insist that every woman must sew because she wears clothing, is just as absurd as to require that every man shall farm because he eats. Why should Harriet Hosmer or Elizabeth Thompson or Harriet Martineau be expected to sew and to cook or to embroider unless they do it as a matter of amusement. Why should it be insisted on that the woman who cannot sew, however wise or noble she may be, is lacking in some essential element of true womanhood. This is what Miss Harvey said in effect in a recent article and a most unjust and narrow statement it appeared to me. Every woman, even the humblest should feel free to reject the use of the needle, just so far as it suits her taste or her means to do so. There should not be any especial guilt felt in the confession, "I do not like to sew." But women have not got beyond feeling it, and society has not got beyond imputing it. The inadequate wages of many a woman compel her to sew when she needs, instead, to use her leisure for rest and mental culture. Such women must and do cut down sewing as much as possible and would still more, if they were not accustomed to think that they must have a certain amount of trimming, even on garments which are invisible to the public.

But, my RURAL sisters, why must you? Why must you even buy Hamburgh trimming, when you would so much rather, if you dared, go without it, and buy instead a book or a photograph or a Japanese vase? Let women make a beginning here; let them reflect that to put so much time and labor into ornament which will soon wear out, is one of the things than can be reformed. I feel quite sure that the ornamentation of clothing comes from a liking for beauty, as well as from mere love of display, but if we cease to decorate what is to be worn-out and used up, we may find a channel for our love of the beautiful in things more permanent, even though they are made with the needle. It seems to me that ornamental needle-work,—provided the article ornamented is one which deserves such adornment,—is as defensible as any other ornamental work, and that there are people who have an especial talent for it very closely akin to, yet not quite the same as the talent of the painter. Some of these can design as well as embroider, as some musicians can compose as well as execute. When, however, we have put ornamental needle-work to its right use, there still remains a word or two of warning about it to be spoken. It is a sedentary reercation, and it taxes the eyesight—two considerations which make it objectionable. At all events, let no one be required or forbidden to "use that polished lance," the needle, by other law or custom than the direction of their own tastes and aptitudes. JICKS.

WARM SLEEPING ROOMS.

I'm glad the barbarous idea that it is healthful to sleep in frigidly cold rooms is being combated. For my part, when I recall all the discomforts, yes, and absolute pain I've endured in cold bed-rooms, I'm ready to pronounce a sentence of perpetual banishment to the Arctic regions, against the inhuman monster who first promulgated the idea that it is "unhealthful to sleep with a fire." If a fire is a good thing during the day when our bodies are at a higher temperature than during sleeping hours, why isn't it a better thing at night? People pile on a hundred weight or so of bed-clothes, shut doors and windows to prevent the entrance of even a breath of fresh air, and in spite of their precautions, what with having to breathe the cold air of the room and the liability there is of the clothes slipping off, they are not comfortable. There is another thing to be considered, heavy covering is weakening. Many delicate women and children are made weary by sleeping under great quantities of covering. Then, it has been demonstrated time after time, in medical reviews and in newspapers generally, that pure air is absolutely necessary to perfect health. What sort of air is that which has been breathed and rebreathed scores of times during the night? Have a fire, and open your windows an inch top and bottom. Instead of laying in a heavy stock of blankets and comfortables, just invest in a stove, the children can then make their toilets in their rooms instead of rushing through the house half-clad to dress by the kitchen-fire, thereby impeding breakfast preparations. Besides, it isn't nice to have washing and combing going on in the same room and at the same time as cooking. A fire need not be kept in the bed-rooms all day. From eight in the morning until about six in the evening it could be dispensed with, and the expense and trouble would thereby be lessened. Think it over ladies, and if you have ideas on the subject, please ventilate them for the benefit of the club. Truly, LINDA BROWN.

THE HOUSEKEEPER'S JUGGLERY.

IT sounds like a very good motto, "One thing at a time, and that done well;" but we housekeepers know that it would never answer for us. We must do a great many things at a time, or at least keep a great many wheels in motion at once, or there will be a sad deficiency in some department. The household profession calls for a skill somewhat like that of the Chinese jugglers, who keep a dozen or two balls in the air at all the same time, catching and tossing each at precisely the right moment, and never allowing one to fall.

According as a housekeeper is able to keep a great number of irons in the fire at once without burning any, will be her general success. She must have an eye on the oven, the kettle and the sauce pan, the baby and the three-year-old, and very likely be setting the table for dinner, all at once. For none of these things can go on well without her constant supervision. Housekeeping may go on as regularly as clock-work, and yet be very unlike clock-work in one respect. You cannot wind it up and set it going in the morning and then have it run on alone for the rest of the day. The winding and grinding process has to go on continually.

I think this "jugglery" is the hardest lesson for the young housekeeper to learn; yet it is one of the possibilities. Those "Heathen Chinese" did not acquire all their skill at once. They were obliged to toss and miss their balls a great many thousands of times before they succeeded in performing their wonderful feats. The best housekeepers could tell you a great many tales of burnt pie-crust, and upset cream pitchers, and heavy cake when company was coming, and many tears dropped over the ironing board, before they arrived at their present state of perfection. So take courage, and be content to gain skill little by little. Systematize your work so that you can keep many things in hand at once. Thus you may save a great deal of precious time to do what you please with. If you wait to fully finish off one thing before you begin another, you will all your life realize the truth of the old saying, that "a woman's work is never done."

J. E. M'C.

ABOUT TEMPERANCE.

IT seems a little strange to me, that not a line has appeared in the Club about Temperance. It cannot be, that the subject has no interest for the ladies who read the RURAL, for how can any woman be indifferent to what so nearly concerns the happiness and prosperity of our homes and our country? I think it would be both profitable and pleasant for us to discuss the ways and means of combating the frightful vice of drunkenness, through the Club.

There is no question but that this evil will have to be fought "in season and out of season," and with all the weapons that ingenuity and patient effort can devise. For myself I am a prohibitionist. I believe in fighting the liquor interest at the polls as well as in the lecture room. Moral influence is excellent in its way, but I would not place my reliance wholly on that. Force as well as persuasion is my motto. There is one thing I would like to call attention to, and that is the habit of applying refined epithets to this coarse sin. A man is no longer drunk, he is inebriated or intoxicated, or he has imbibed too freely. We are becoming much too elegant to use such vulgar expressions as drunk and drunkenness. It seems to lessen the disgrace of the thing when we soften the word that describes it, and as words are a power, may not a failure to characterize this sin by the name which best expresses the coarseness of the act make the sin itself appear less repulsive? JO MORSE.

News of the Week.

Monday, Dec. 30, 1878.

[NOTE.—The RURAL NEW-YORKER expresses no political opinions whatsoever. We merely furnish a *resume* of the week's political occurrences for the benefit of those who do not read the daily papers.—EDS.]

POLITICAL.

CONGRESS having adjourned for the holidays, there is little political news of interest abroad. The session was a short but a busy one. The Senate passed the pension and Postal-Car Deficiency Bills and a Bill repealing the law which permits jury challenges on the ground of voluntary participation in the Rebellion. The House has passed the Indian Appropriation Bill without regard to the controversy now pending about the transfer. On Thursday Senator Burnside reported from his Joint Committee the voluminous Army Bill, whose preparation had been kept quite secret. Simultaneously the House Naval Committee has agreed upon a Bill establishing a Board of Assistants to the Secretary of the Navy. The House Committee on Currency and Finance adjourned without being able to reach a conclusion in regard to the measures that have been referred to it.

Senator Teller is chairman of the committee asked for by Blaine, and it is therefore called the Teller Committee. There was danger of its being brought to a standstill for lack of funds, as no appropriation had been made to defray its expenses. It has been found, however, that there is in the Treasury a balance of $20,000 appropriated for investigations in Florida and Louisiana by the Potter Committee, and the Department of Justice has just decided that that sum can be used by the Teller Committee.

MISCELLANEOUS.

The trials of the election cases at Charleston, S. C., will begin early in the new year. Chief Justice Waite will preside, with Judge Bond as associate. The Department of Justice claims to have important evidence. The Supreme Court has 1,080 cases on its docket. Its business is nearly three years behind, and losing constantly. For all this, Justice Swayne thinks "litigation rapidly falling off." This diminution, he ascribes to the fact that contracts broken by the strain of the financial panic have been about adjudicated, and the volume of law business has got back to nearly its normal state.

There have been distributed during the year drawing to a close, from the Department of Agriculture, over 50,000 young tea plants, and as many more will be distributed during the coming year. Commissioner Le Duc is still sanguine that tea can be cheaply and profitably grown in the United States.

For two or three years back there has been a good deal of quasi-scientific talk about changes in the Gulf Stream, spots in the sun, etc., etc., all going to account for our milder winters; but this year winter has set in in dead earnest for the holidays, both in this country and Europe. The storm of Saturday and Sunday was especially severe in New York State, and it has delayed trains at Buffalo with snow three feet on the level, blocking all Erie and New York Central stock trains at East Buffalo, and obstructing thoroughly travel in the northern part of the State and in Canada. The cold has also been very intense all through the West. In Great Britain and throughout the continent the fall of snow has been heavier than for thirty years. It was particularly heavy in Scotland, drifting 12 feet deep about Aberdeen, near which place a dozen trains were snowed in. In Geneva 400 men and 120 carts are constantly kept at work clearing the streets, and travel is almost wholly interrupted throughout Switzerland. There is more snow on the Vosges than the oldest inhabitant remembers, and it has driven the wolves out so that they have penetrated to the very gates of Metz.

The Moffet bell-punch is not quite so popular as it was. The liquor dealers generally don't like it, and the other people find that it is not working such financial wonders as had been promised. Indeed, the statement comes from Richmond that it has realized only $83,00 more in Virgina the past year than the old system, while it was expected to yield a revenue of at least $600,000. The marble palace in which the 102d Legislature of New York is soon to meet was to have cost $4,000,000, but, built during the wildest days of inflation and extravagance, it has swallowed up $14,000,000 since it was begun at the close of the war, though fortunately without entailing any debt. It is the most costly structure on the continent, next to the capitol at Washington, and is the second New York capitol at Albany. The first one was finished in 1807, ten years after the Legislature had finally settled down there, and cost $120,000.

South Carolina under democratic rule still continues more liberal in its policy regarding intermarriage of the races than Rhode Island under republican sway. The New England commonwealth obstinately refuses through its Legislature to repeal the ancient prohibition against a "nigger's" marrying a white woman—if he can find one who would like to be his wife. The South Carolina Legislature, almost unanimously democratic, has just refused to interfere with the freedom in this respect now enjoyed in that State by putting the Rhode Island law on the statute book, as some of the members wanted to do.

The suit brought against the government, by the heirs of Stephen A. Douglas, for certain cotton captured in Mississippi during the war and sold as abandoned property, is settled finally in the court of claims by judgment in favor of the claimants. The case has been pending for years and has been the subject of much controversy, investigation and litigation. The heirs are Robert M. Douglas, United States marshal for the western district of North Carolina, and Stephen A. Douglas, Jr.

Venerable Myra Clark Gaines has added another to the reverses of her eventful career, the House committee on private land claims at Washington having lopped off 80,000 acres from the 85,000 in Louisiana on which she claimed scrip, because her grandfather had no title for the land from the Spanish government, but the committee will report a bill in favor of allowing her the remaining 5,000 acres.

Since gold fell to par the demand for standard silver dollars has steadily increased. Before that time orders received at the Treasury Department averaged about 10,000 daily. Now they run up to more than three times that sum. With the return of financial matters to a specie basis, wages too, have gone back to about ante-bellum rates. The following are the average wages paid at the factories of Connecticut.

	1859 and 1860.	1876.	1878.
Laborers	$1 00@1 25	$1 66@2 00	$1 00@1 75
Unskilled mechanics	1 00@1 12	1 25@1 75	1 12@1 25
Mechanics	1 12@1 50	1 75@2 25	1 25@1 75
Skilled mechanics	1 75@2 50	2 50@3 50	2 00@3 00
Extra skilled mech's	3 00@4 00	3 50@6 00	3 00@5 00
Foremen	2 00@3 00	2 50@3 00	2 50@8 00

The trifle of increase in present rates over those of 1860, is fully counterbalanced by the higher prices for most commodities now-a-days, owing to our much heavier taxation—if to no other reason.

The New York Produce Exchange has sent a circular to all the commercial bodies in the United States, urging that the pound be taken as the unit of weight in the sale of all articles of produce, and that larger transactions should be indicated by the 100 pounds and by multiples thereof. Last year we sold England $150,000,000 worth of grain, live stock, meats, cheese and eggs. We sent over 300,000 cattle, 1,000,000 sheep, 50,000 swine and 30,000 horses. The cost of recent wars, as computed by competent authorities, is as follows:

	Cost.
The Southern rebellion	$6,000,000,000
Austro-German war	300,000,000
Austro-Italian	150,000,000
Austro-German-Danish war	20,000,000
Franco-German war	4,000,000,000
Russo-Turkish war	1,500,000,000
Total	$11,970,000,000

FOREIGN.

From across the Atlantic Great Britain sends news of dire distress among her operatives. Having disposed of all their salable belongings, the starving working people are now crowding into the poor-houses. In view of the severe competition from this country, farmers in the North of England are agitating for a repeal of the free-trade laws with regard to certain kinds of raw materials in which they are unable to complete profitably with foreign supplies. Many manufacturers, too, are not so enthusiastic as formerly on the manifold virtues of free trade. It was all well enough as long as they supplied the markets of the world and had no foreign competition at home; but lately cotton goods from this country and iron-ware from Belgium and Germany compete successfully in English markets with native products, and are running English goods closely in the markets of the world. In Germany, too, Bismarck is vigorously pressing the passage of a law imposing protective duties on all articles of foreign manufacture which come in competition with goods made at home. He wants to return to the tariff of 1819. Meanwhile he is energetically enforcing all laws against the socialists, but is so anxious to retain in the country men suitable for the army that a naturalized American who wished to deliver a course of lectures in Berlin on the beauties and advantages of this country, has been forbidden to do so, lest his words might increase the emigration of likely young men.

The impression that the Afghanistan war is ended, is confirmed by the recent capture of Jelalabad by the British, and the arrival there shortly afterwards of Yacoob Khan, son of Shere Ali, whom the latter left in command of his forces on his own flight in company with the Russian Embassy. It is said that the son will be set upon the father's throne; but in that case it would be necessary for the English to keep him there, as it is not improbable that efforts would be made by the father and his adherents to displace him. For the present, heavy snows and severe cold are impeding operations and causing a great deal of sickness and mortality among the European and Hindoo contingents of the British army.

The distress in the interior provinces of Brazil is reported as appalling. The people are even devouring the corpses of those who have perished of starvation, to escape a like fate. It is difficult to see how such a condition of affairs can exist in agricultural communities where no destruction of crops has been reported. Moreover, a telegram from Ceara, reports deaths in the capital from smallpox to the number of 600 daily.

A letter from Cairo, Egypt, states that English and Scottish horse raisers, who have been furnishing carriage horses of high quality to that country, state they can not compete at home with the horse raisers of Kentucky and Ohio, who send fine carriage horses to England, and far undersell the native English raisers. The letter, therefore, suggests shipments of horses from America to Egypt.

The Whitehall Review, of London, has lately been publishing lists of converts from the Protestant to the Roman Catholic Church in England within the last 25 or 30 years, giving the names and conditions of most of the wealthier ones. The matter has caused a good deal of excitement across the water, and a brief summary of the chief sources from which the best known of them have come, may be of interest to some RURAL readers. Of them 200 are from Oxford University, 150 from Cambridge; from Trinity College, Dublin, and London University jointly, only 10; 85 of the army, 14 of the navy, 45 of the bar, 13 peers, 14 peeresses, 19 sons and 28 daughters of peers, 78 other titled ladies, and 35 titled men—in all 1,500.

England and Russia are fast becoming close friends again, to all appearances, at any rate. The former proposes the Duke of Edinburgh, Victoria's son, and the Czar's son-in-law, as King of Bulgaria. Turkey and Russia, also, will soon sign a final treaty of peace and amity, and preparations are under way for transporting to the Crimea 100,000 of the troops now in Turkey so soon as the treaty shall have been signed. Immense quantities of wheat are being shipped from Odessa, and most of it is landed at Marseilles.

The Supreme Court of Justice of Spain has finally condemned to death Juan Moncasi, who attempted to assassinate the king, Oct. 25.

Beginning with a production of four pounds of tea in 1840, India now exports 40,000,000 pounds and all the islands of the Indian archipelago are cultivating the plant.

The London Truth says the Duke of Connaught, one of Victoria's sons, will be appointed Lord-Lieutenant of Ireland as soon after his marriage as an opportunity occurs to provide for the Duke of Marlborough, who at presents holds the position.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

BY ANNIE L. JACK.

GLOOMY SKIES, FIRESIDES AND SPIRITS.

"WEEKS of dull, dreary, sunless weather, try the most amiable temper." So says the family oracle, and we all bow assent. For during the long time of cloud which this November has brought us, have we not felt every careless word, every duty undone by anybody, or overdone by somebody, rasping on our nerves, and irritating us? Even the cat goes around twirling her body in search of her tail in gloomy persistence, and the chickens walk past the window in silence without indulging in a single r-r-r. The kitchen fire, too, is in the pouts, for to-day a thread of smoke is found to emerge from the joints of the pipes, and we are told it is due to a "bad wind." A smoky chimney is like the toothache—it gains one but little sympathy, yet if a man had to stand, as I have seen some women do, over a smoky fire, with eyes full of sharp tears, there would be some tall talking, and he would find some means of stopping the nuisance, even if to do it, he had to go to the village blacksmith's, for I have often noticed that *that* is the panacea for many of the dull, blunt things that worry a farmer's life. And speaking of blunt things, the bread knife and the butcher knife felt dull, too, and would not cut anything for breakfast that morning, but this is one of the evils a woman should know how to remedy, so we speedily made them as sharp as ever.

But the conversation about all these annoyances took place one breakfast time, and if it contained any element of unhappiness as a morning picture, it must be attributed to the want of sunlight in our darkened home. And yet I was reading yesterday that the proportion of sunny days in Canada as compared with Boston, is as fourteen to nine per month. Poor, dark, Boston, if so much more dim thy skies this last fortnight! And now comes the rain. If there has been one day without mist or rain for the last three weeks I do not remember it. Surely now we have had enough of the moist air said to be so conducive to health and beauty.

"Well, I much prefer clear skies," says the family critic; and the would-be wit among us remarked that the air was so calm even the wind could not rise and hoped the bread would not suffer from the general depression. And this sent the amateur cook to look at the sponge which we knew was satisfactory by her gentle, self-satisfied nod. It is one of the luxuries of farm life to be able to have home-made bread from home-grown wheat. There is about it a flavor that is not to be defined, but is, nevertheless, felt and tasted. We use hop yeast, making it every week, and keep in the yeast-jar a piece or two of root ginger, which is a great improvement in the raising. The sponge is set over-night with a few potatoes mashed through a sieve and mixed with the water to be used in setting. Two workings the next morning, and then our loaves are set to rise before the fire, taking care to have the pans out of the way of a draft. Count twenty quickly with the hand in the oven—it is an old-fashioned thermometer but safe—and bake for an hour and a quarter with a steady fire. There is no baker's bread that has the same sweet, nutty taste; it will even put one in a good humor on a sunless, gloomy day.

HYGIENIC FOOD.

ONE hears a great deal, nowadays about hygienic food. I should like to know what it really is, for I do not think many of the writers about it have a very clear idea of it themselves. They talk of "albuminous food," and food rich in nitrogen, or gluten; but they do not tell the average woman, who is not usually a profound chemist, what to eat and what to avoid. And they talk a good deal of nonsense, too. One lady, a constant contributor to an agricultural paper, who writes continually about brain and body food, gave, as an excellent—and, I believe, "hygienic"—dish, cabbage boiled in a small quantity of water till soft, and then thickened with milk and seasoned to taste.

Shade of departed Hygiea, think of that! As if cabbage boiled were not enough—and it is a well-known fact that boiled cabbage is less digestible than raw—she adds milk to it. I do not object to milk in itself, but the mixture is barbarous.

I wish to say a word about pies, though it is a well-worn theme. I do not think they should be banished entirely, for if they are well made, and eaten in moderation, they do no harm. A German physician told me the Americans do not know how to make or eat pies, but I am not ready to believe that. For my part, I prefer my fruit *au naturel*. And I think in the summer we can do almost without pies. A dish of blanc-mange, and one of fruit, stewed or raw, form a delicious dessert.

It is very well to point out pale, nervous school-girls, and say that their paleness and nervousness are the results of indigestible food, but these traits are oftener the results of late hours and insufficient exercise. If girls would keep early hours, and take long walks, we should not hear so much about the need of "hygienic food." SARAH GAMP.

CARPET SWEEPING.

I would like the "testimony" of rural dames who have used carpet-sweepers, in regard to their superiority over the ordinary broom—if, indeed, they are preferable. I have been assured that with a sweeper one can sweep a carpet with ease, raise less dust, remove more dirt and litter by far than with a broom, and at much less wear to the carpet. M. W. F.

DOMESTIC RECIPES.

Corn-Starch Cake.

One cup of butter; two cups of sugar; two cups of flour; two cups of corn starch; four eggs; one cup of milk; one teaspoonful of soda, and two teaspoonfuls of cream-of-tartar; pinch of salt; flavor to taste.

Mountain Cake.

Two cups of sugar; one cup of butter; one cup of milk; four cups of flour; the whites of four eggs; one teaspoonful of soda; two teaspoonfuls of cream-of-tartar; one pound of raisins; a pinch of salt.

White Cake.

One cup of butter; three cups of sugar; four and one half cups of flour; the whites of ten eggs; one cup of milk; one teaspoonful of soda; two teaspoonfuls of cream-of-tartar and a little salt; flavor with bitter almonds. This cake requires some time to bake, but is very nice. One great secret in making cake is thorough beating. Beat the butter and sugar together, and the yelks and whites of the eggs separately. Then add the yelks to the butter and sugar, and beat until you are tired. The greater part of the beating should be done before the flour is added. I always use sweet milk in cake and a small teaspoonful of soda, and large ones of cream-of-tartar.

The corn-starch cake should be baked in small, round tins. If anyone should try these recipes and fail, she must not think that the fault is in the recipes, for I have tried them repeatedly with the best of results. I prefer powdered sugar in making cake, but sometimes it will not stir to a cream with the butter, but seems heavy like plaster. If the powdered sugar is poor, I use granulated. Butter a paper the size of the bottom of the cake tin, to prevent the cake sticking to the tin. M.

Sweet Cider.

Mrs. M. L. says that cider may be kept sweet by adding mace, cinnamon and mustard-seed—a quarter of a pound each—with a pound of raisins to a barrel of cider. Rack the cider until free from pumace: put the spice and raisins into a cloth bag, which should be long enough to extend from the bung to opposite side. Drive the bung over the top of the bag and let stand a few weeks before tapping.

Dish-Washing.

I am truly sorry for those young housekeepers who hate to wash greasy dishes. A few directions which I will give, simple as they seem, will, if followed, help to lessen the disagreeableness of this dreaded duty. I would fill the dish-pan half full, or nearly so, with water as hot as you can bear the hands in. Take enough soap to make a slight suds; put in the dishes, having a clean dish-cloth. Wash them and turn into a pan, and pour hot water over them; then turn them into another pan to drain: take another clean dish-towel to wipe them with, and they will wipe so quickly and easily you will be surprised. If you will put water into the pots and kettles as soon as emptied, they will be soaked so that they will wash easily by the time you are ready for them.

Dessert Pudding.

One cupful of sour buttermilk; two tablespoonfuls of fried meal drippings, or the same of melted butter; one scant teaspoonful of soda; a pinch of salt; one cup and a half of flour; stir together into a batter. Have ready two or three large apples; pare and slice them on a buttered tin and pour the batter over them. Bake half an hour; serve warm, with sugar and cream or vinegar sauce. T. T.

OUR FREE SEED DISTRIBUTION.

SEEDS of the following varieties of plants are offered to our subscribers without any charge whatever (except for postage, a part of which we bear) until further notice:

DEFIANCE WHEAT. A hybrid spring wheat. The most promising variety ever before offered.

"PEARL" OR "EGYPTIAN" MILLET. One of the most promising fodder plants known.

BEAUTY OF HEBRON POTATO. According to many careful tests, this is ten days earlier than Early Rose, as good in quality, and more prolific.

THE VOORHIS WATERMELON. A specialty of the Rural Farm.

GOLDEN RURAL TOMATO. A specialty of the Rural Grounds.

ACME TOMATO. This is offered as the best of the newer varieties of Tomatoes to those who may prefer it to a trial of the Golden Rural.

NEW BRONZE RICINUS. Specialty of the Rural Grounds. The most beautiful Ricinus in cultivation. A cross between Ricinus Gibsonii and R. sanguineus.

HIBISCUS MOSCHEUTOS—the showy and beautiful Rose Mallow, never before offered so far as we know. Hardy.

CALLICARPA AMERICANA (Purpurea). The brilliant French Mulberry. Hardy.

HIBISCUS SYRIACUS. One of the most charming of hardy shrubs. Sometimes called "Rose of Sharon." Our seeds are saved from double-flowering varieties—many of them from seedling plants. They grow readily from seeds, and bloom as soon as plants would if transplanted from nurseries. The seedlings "sport" without end.

WEIGELA. Seeds saved mostly from seedlings. This is probably the finest hardy shrub in cultivation.

DEUTZIA CRENATA fl. pl. Seeds saved from seedlings at the Rural Grounds. Seventy-five per cent. of seedlings will bear double flowers. It is perfectly hardy and there is no finer shrub known for ornamental grounds.

HIBISCUS MILITARIS. Hardy and beautiful.

ERYNGIUM LEAVENWORTHII. The most striking annual of recent introduction. (See RURAL of November 9th for engraving of this and other plants, seeds of which we offer.)

GERANIUM SANGUINEUM. A true geranium of great beauty. Perfectly hardy.

YUCCA FILAMENTOSA. Every farmer and lover of plants should have specimens of this perfectly hardy evergreen liliaceous plant in his grounds. It is superb.

VITIS HETEROPHYLLA. See RURAL, Nov. 9, for description of this hardy vine.

RURAL HYBRID AQUILEGIAS. Beautiful, hardy perennials of great beauty.

GRINDELIA SQUARROSA. See RURAL of Nov. 9 for remarks.

OBSERVE.

Any ten of the above require a one-cent postage stamp:—that is, ONE *cent* for the ten, not for each, except the Beauty of Hebron Potato, Pearl Millet and Defiance Wheat. The Beauty of Hebron requires a two-cent extra stamp and the other two a two-cent extra stamp also.

Other varieties *may be* added. We intend this free seed distribution to be the most valuable of its kind that has ever been gratuitously offered by any journal, and to introduce the above valuable plants to the homes of farmers and horticulturists in every part of our country.

Sudden Changes of the Weather often cause Pulmonary, Bronchial and Asthmatic troubles. "*Brown's Bronchial Troches*" will allay irritation which induces coughing, oftentimes giving immediate relief. **25c. a box.**

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 28, 1878.

BEANS AND PEAS.—There is no improvement in the demand for beans, while the market is lower for mediums and marrows. Supplies large, except of white and red kidneys. Pea beans show few choice samples. Red kidney active for Southern and West Indian use; quoted firm. Black beans steady at late rates. Green peas are in ample supply; must be prime at $1.30@1.35. Canadian field peas, in bulk and bond, 72@74c.; Southern B. E. peas quiet, and have lost their late advance quoted, $2.60@2.70; Medium beans, prime, $1.50; fair to good, $1.30@1.40; Marrow, free on ship, $1.65@1.67½; fair to good, $1.40@1.45; pea, $1.50@1.75; white kidney, $1.80@2.00; red do., $1.90@2.25; Black, $1.90@2.25.

Receipts of beans for week, 12,676 bushels; exports, 1,000 bbls.

BUTTER.—December's dullness has followed it to the end, and dealers hope that if buyers have made among other good resolutions for the new year one to do better by the butter market, they will lose no time in giving trade the benefit of it. The large stocks that are being carried certainly make a heavy outlook for the coming winter months and weather that will materially check future receipts together with a decidedly enlarged demand, will be required to put back-bone into the market. Exports light but include best grades; extra State dairies held with some confidence at old ranges. Some straight lines of fine tubs have realized 21c. Welsh quoted extreme. Western stock has the strongest side of the market; but creamery very firm. Dairy and useful factory firm, receipts somewhat slender. No sale for poor rolls.

State, full dairies, special, 20c.; other, 16@19c.; firkin dairies, fair to prime, 13@18c.; Welsh dairies, fine full, 16½@17½c.; choice dairy, pails and half tubs, 22@23c.; fair to prime do., 18@21c.; choice Welsh, 19@20c. fair to prime, 13@17c. Choice creamery 24@28c.; other, 23@24c. Best Western creamery, 30c.; other, 23@28c.; early packed creamery, 17@20c.; poor State 10@12c.; Western dairy, fine fresh, 15@18c.; fair to good, 10@14c.; factory, choice, 13@14c.; other, 6@12c.; rolls, 8@14c.

Receipts for week, 21,160 pkgs. Exports, 3,560 firkins.

BEESWAX.—Small lots are being placed at 26@27c. for Western and Southern.

BROOM CORN.—There are full supplies and not much being done. Jobbing rates are 4½@5½c. for medium green to choice hurl, with inferior at 4c. Car lots do not exceed 4½c. for very best and off grades sold below 4c.

CHEESE.—The exports for the week have been 25,146 boxes. These light shipments are incident to the holiday week. The market has a dull look, and as to prices show no marked change. Quotations are: 8¼@9c. for fancy, special lots to 9½c.; 8@8¼c. for fine lots; 7¾@7¾c. for good; 4@5c. for skimmed. State, farm dairy at 8@8¼c. for fine; 7@7½c. for good to prime, Wisconsin factory, fine, 8¼@8¾c.; some fancy lots to 9c.; do. good to prime, 7¾@8¼c. Western factory, fine and fancy 7½@8¼c.; good and prime, 6@7c.; do. full, skimmed, 2@5c.

Receipts for week, 39,110 boxes.

Liverpool cable 45s.

COTTON.—Towards the close the market shows a decided advance on a sharp rise in the Liverpool market, partly based upon the probabilities of increased consumption abroad. Closing prices are for December, 9.48@9.50c.; January, 9.53@9.55c.; February, 9.71@9.72c.; March, 9.86@9.87c.; April, 9.99@10c.; May, 11.10@11.11c.; June, 10.20@10.21c.; July, 10.28@10.30c.; August, 10.32@10.35c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*N. Orleans*	*Texas.*
Ordinary	7⅝	7¾	7¾
Strict ordinary	8 1-16	8 3-16	8 3-16

Stained.

Good ordinary.....7¾; Strict good ordinary.....8¼
Low middling.....8¾; Middling 9¼

DRIED FRUITS.—General trade is slack as usual at this period of the year, and prices nominally unchanged.

Southern plums at 13½@14c.; State plums, 15@15½c.; Blackberries are quoted at 5@5½c. Peaches—Peeled Georgia, at 6@7c. for poor; 8@9c. for fair to good; 10@10½c. for prime; choice North Carolina, 11½@12½c.; good do., 8@10c.; unpeeled halves, 3@3½c.; quarters, 3@3½c. Pitted cherries, 22c. Apples—Old State quarters, 3½@3c. New apples, 2@2½c. for southern quarters in bags.; 3½@4c. for good and prime sliced; do., fair at 3@3½c. State at 3½@4½c. for new sliced; and 3@3½c. for quarters; western at 2½@2¾c. for new quarters. Raspberries, 30c.

Exports, past week, 1,000 bbls. dried apples. Since Jan. 1st, 20,000 do.; in '77, 27,300 do.

EGGS.—Cold weather at the West has cut off arrivals, and the market is higher and firm for both fresh and limed. Near points, 29@30c.; State and Penn., 27@27½c.; Western, fresh, 27c.; Southern, 27c.; Canadian, 25@25c.; under quality, 21@22c. Limed, choice, 18@18½c.; good, 17@17½c.; other, 14@16c.

Receipts for the week, 3,987 bbls.; do. last week, 6,734 do.

ESSENTIAL OILS.—First hand prices in N. Y. as follows: Peppermint in tin, $1.60; in glass, $2.30; sassafras, 44c.; wintergreen, $2.15; tansey, $2; wormwood, $3; pennyroyal, $1.25.

FEATHERS.—White live geese prime, 40@45c.

FRESH FRUITS.—Apples are freely offered at quotations. Owners are willing to forego some profit while the supply is so large, trusting to make it up further along in the season. Spits, choice, $1 75@2; other, $1 25@1 50; Baldwins, $1 25@1 75; Greenings and Spys, $1 25@1 50; common, 75c.@$1; Lady, choice, $5@7; poor, 2@3 50. Cranberries scarce compared with former seasons; prices very remunerative. Fancy Cape Cod, bbl., $9; fair to prime, $7@8 50; poor, $5@6 50; N. J., crates, fancy, $2 50@2 75; other, $1 75@2 25. Catawba grapes, nominally, 6@8½c. Fla. oranges steady, but the demand is not so sharp as holidays would warrant. Pecans, Texas, scarce, 12@14c. lb. Chestnuts out of date. Hickory nuts, shellbarcks, $2 50@2 75; Va. hand-picked peanuts $1 10; other grades, 85@35c.; shelled, 4@5c.; demand good.

Export of apples for week, 5,424 bbls.

FLOUR.—Trade has suffered on account of the holidays and close approach to a new year, and, with full supplies, prices have favored buyers.

Latest sales are at $3.15@3.60 for very inferior to fancy superfine State; $3.60@3.90 for very poor to good extra do., odd lots and lines; $3.90@4.25 for good to very choice do., and fancy lots above this; $3.15@3.65 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $3.50@3.90 for very inferior to good shipping extra do. and $3.90@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.00@5.00; choice to fancy do. at $5.00@5.75; red and amber winter wheat, very inferior to very choice trade and family $3.00@5.00 round hoop Ohio at $3.55@4.25, and trade and family brands of do. at $4.25@5.50, the latter rate for very choice; St. Louis, $4.00@4.75 for very poor to good extra, and $4.75@5.00 for good to choice; Minnesota clear, very inferior to fancy, at $3.50@5.00; few brands going above $4.50; Minnesota "straight," inferior to fancy at $4.40@5.45; and patent fair to strictly fancy at $5.25@8.25, few brands going above $7.50; unsound stock at from $2.00@4.75; city mill extra at $4.65@5.00 for West Indies (the latter rate for fancy in new packages); do. for England $3.70@3.85; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.60 for fair to very choice; No. 2 at $2.30@2.90 for very inferior to strictly fancy.

CORN MEAL.—Is at $2.15@2.50 for yellow Western and $2.80@2.85 for Brandywine.

FURS AND SKINS.—Market fairly animated.

	Nor. & East. No. 1 quality.	West & N. W No. 1 quality.

Wolf, mountain		1 50@2 00
prairie		50@60

Southern furs usually sell 15 to 20 per cent. below western.

GRAIN—Speculative manipulation forced prices of wheat up early in the week, more particularly in the figuring on certain grades of winter, to apply on contracts. At the close the market is easy, and sales as follows of ungraded amber at $1 03@1 03½; No. 2 amber at $1 05½@1 06½; ungraded red at $1 01@1 08; No. 3 red $1 03@1 04½; No. 2 red, at $1 10½@1 11; No. 1 red at $1 10½@1 11; extra white at $1 11@1 11½; white State at $1 09½@1 10: No. 1 white at $1 09½@1 10½; No. 2 white rt $1 06@1 07; ungraded white at $1 06@1 10; New York No. 2 spring, January option, at 96½@97c.; No. 2, amber, December option, at $1 06; do. January option, at $1 06¾; do., February option, at 1,07¾; No. 2 red, December option, at $1 10½@1 11; do. January option, at $1 10¾@1 10¾; do., February option, at $1 10½@1 11. Rye at 57@59c. for Western and 58@60c. for State. Corn is variable, closing firm and moderately active; sales of steamer mixed at 45½@46c.; New York No. 2 at 47@47½c.; New York No. 3 at 44@44½c.; ungraded mixed at 46@47½c.; New York No. 2 white at 48c.; yellow Southern at 46½@47c.; yellow Western at 47c.; round yellow at 50c., for a car lot; No. 2, December option, at 47½@47½c.; do. January option, at 47½c.; do. February option, at 46½c.; new No. 2, January option, at 46½c.; steamer mixed, December option, at 46c.; do. January option, at 45½c.; do. February option, at 45½c. Oats are slow and easy in price; sales of New York No. 1 at 31½c.; New York No. 2 at 30½c.; New York No. 2 white at 32½@33c.; New York No. 3 quoted at 29½@30c.; New York No. 3 white quoted at 31½@32c.; white Western at 31@34½c.; mixed do. at 29½@31c.; white State at 33@33c.; mixed do. at 31c.; No. 2 Chicago, afloat, at 31c.; New York extra white at 33@33c.; New York No. 1 white at 34@34½c.; No. 2 Milwaukee at 30½@31c.

Barley State, 6-rowed, 90c.@$1; do., 2-rowed, 75c.@80c.; Canadian, 95c@$1 25; malt, $1@1 25, the higher for Canadian.

HAY AND STRAW.—There is a good business and diminished receipts strengthen prices.

Sales at 35@40c. for shipping, and 65@75c. for retail qualities. Straw quoted at 35@45c. for long rye, and 25@30c. for short rye, and oat at 40@45c.

Exports since Jan. 1st, 61,429 bales; do., 1877, 50,600.

HONEY.—Popular prices have not brought out the expected holiday demand. Consumption would perhaps be larger if retailers would adopt rates more in keeping with their outlay. Fine comb has now an abundance that deprives it of its former standard of luxury. Clover comb, single, 11@13c., two do., 9@11c.; buckwheat, 7@9c.; strained, 6@10c.

HOPS.—Some fancy parcels are held above quotations. The exports for the week are 700 bales, and there is a good inquiry from shippers for choice lots.

Quotations are for New Yorks, new crop, choice, 12@15; New Yorks, new crop, good and prime, 8@10; New Yorks, new crop, low to fair, 5@7; Eastern, 8@12; Western, 8@12; Yearlings, 4@6; Olds, all growths, 2@3; Pacific coast, 12@15.

POULTRY AND GAME.—The week has been a showy one for dressed stock, especially for turkeys. The Christmas supply was elegant, and though prices were not high, they ran even owing to the uniform good quality. The near South sent some very attractive dry-picked this year, and there is room for repetitions. Geese seem to have lost their special Christmas call. A certain class of our foreign population used to form a valuable demand. Custom, however, has given place to economy, and the plump, tender turkey can be more readily placed at fair prices than bony or doubtful aged geese at cheap figures.

Live poultry has no settled place in trade. Dressed can now be depended on as a regular receipt, and the weather favors what has to be carried over. Chickens, 6@8c., lb.; fowls, 6@8c.; roosters, 4@4½c.; turkeys, 8@9c.; ducks, choice, pair, 65c.@$1; other, 50@60c.; N. J. geese, $1.75@$2; other, $1@$1.50; pigeons, 30@35c.

Dry picked turkeys, 12@13c.; prime scalded, 11@12c.; fair, 8@9c. Chickens and fowls, dry picked, 12@13c.; common to good, scalded, 7@9c. Very poor ducks, 5@6c.; choice, 11@12c.; other, 9@10c. Geese range, 6@10c.

This is the largest quail season ever known; prices are low but not low enough to keep a large portion of the receipts out of store. Grouse ahead of demand. Wild ducks quiet, but likely to be wanted. Quail, doz., 70@75c.; Grouse, trapped, pair, 75c.; drawn, 60@65c.; Partridges, State, 75@80c.; other, 50@60c.; canvas-back Ducks, Havre de Grace, $2.50@2.75 pair; Western, $2@2.25; red head, 75c.@$1.25; Mallard, 50c.; Teal, 35@40c.; common, 25@35c.; Hares, 30@40c.; Rabbits, 25@30c.; Venison, short saddles, 9@10c.; long do., 7@9c.; whole deer, 6@7c.

PROVISIONS.—Hog products have been steadily tending downward. Mess pork quoted $8.90 bid and $9 asked for old for December; $8.95 bid and $9 asked for old for January; $8.20 bid and $8.40 asked for new for January; $8.35 bid and $7 15 asked for old for February; $8.25 bid and $8.30 asked for new for February; $7 bid and $7.25 asked for old for March, and $8.30 for new for March. Bacon at $4 for long and short clear, half and half. Lard—Western steam at $5.70 for spot lots; $5.67½ for December and January; $5.72½ for February, and $5.77½@5 80 for March. Stearine at 6¾@6¾c. for prime. Beef hams at $14.50@14.75. Tallow at 6¾@6 11-16c. for prime. Beef—Extra India mess, $20.50@31 for city brands; do. Philadelphia, $18.00@12; packet at $11@11.50; plain mess at $10@10.50; extra mess at $10.50@11.50.

VEGETABLES.—Buyers have taken some advantage of good hauling weather and comparatively easy rates for potatoes, but the offering continues large. Other items steady with the advancing season.

Nova Scotia E. Rose, bulk, $2.37@2.75 ₱ bbl.; Prolific and Chili red, $2.25@2.50; P. E. I. Jackson whites, $2; Mercers, $1.75@2; Eastern E. Rose, with bbl., $2.25@2.37; State, $2.50; fair to good, $2@2.37; do. Peach Blow, choice, $2.50@3.75; common, $2@2.25; Peerless, choice, $2.37@2.50; poor to good, $2@2.25. Sweet potatoes, Del., $2@2.50; Onions steady. White, $1.50@2; red and yellow, $1.75; Chester, $1.25@1.62. Hubbard and marrow squash, $1.75@2. Cabbage, $1@5 per 100. Cauliflower, bbl., $1.50@3. R. Turnips, 75@87c. Beets, 75c. Carrots, 75c.@$1. Pumpkins, 100, 4@@10. Celery, 60@75c. doz. Extras; hot-house Radishes, $3 ₱ 100 bunches; Cucumbers, $1@3 doz.; Mushrooms, 40@50c. ₶.

Exports, potatoes, past week, 3,150 bbls.; onions, 225.

SEEDS.—Clover is selling slowly; quoted at 6¾@6¾c. for prime, to 7c. for choice. Timothy quiet at $1.25 for prime. Flaxseed is strong at $1.42½.

TOBACCO—is held firmly, and quotations essentially as last week, with a quiet feeling, as usual, at the close of a year.

SEEDLEAF—CROP OF 1877.

WOOL.—The market has not varied from last week, with a moderate degree of activity, X and XX Ohio fleeces have sold at 34@35; fine Ohio combing and deluine at 38@40: medium and coarse do. at 33@38.

LIVE STOCK MARKETS.

Saturday, Dec 28, 1878.

BEEVES.—Receipts for the week, 9,526 head do.; last week, 11,320 do. Light receipts have kept the market stiff; poor to choice western steers sold at the close at a range of 7¾@10½c., dress 55@57 lbs. Old cows and young heifers, 2.50@3 per 100; an exporter paid 8½@9¼c. for nearly 400 steers, to dress 56 lbs. Quality well graded, but not so many fancy tips reported for holiday use as usual. Poultry has had quite a run during the week, and butchers have not felt the want of full ordinary supplies. One lot of premium Ohio steers brought 11¾c., dress 58 lbs.

COWS AND CALVES—There is no quotable change in the style of cows now arriving, sales generally at $40@60 per head. An extra milker would bring $70 or 75, but, as before, such grades would have a home quotation which would not make N. Y. prices compensating.

VEAL CALVES.—Choice N. J., milk, 6½@7; fair to good including high weights, 5½@6c.; State range good to best, 6@7c.; fed calves, 4@5c.; grass, 2½@3c. Hay dressed calves steady, with favorable weather.

SHEEP AND LAMBS.—Receipts for the week, 13,115 head; do. last week, 22,716 do. Trade has ruled rather quiet and prices are something easier; market, however, closes firm. Extra sheep, 5½c.; common to fair, 4@5c., the lower for ewes. Lambs, 5@6c.

SWINE.—Receipts for the week, 10,940 head; do., last week, 43,900 do. Market firm with fairly free sales at $3.25@3.30 including good Ohio corn.

Dressed hogs, N. J. light, 4¾c.; medium, 4¼@4½c.; heavy, 3¾c.; top for State, 4½c.; city, 3¾@4¼c.

HORSFORD'S Bread Preparation
UNSURPASSED FOR MAKING
LIGHT BREAD,
Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.
Manufactured according to the directions of Prof. E. N. Horsford, by the Rumford Chemical Works, Providence, R. I.

A GREAT OFFER FOR
HOLIDAYS!!!
We will during the HOLIDAYS *dispose of* 100 PIANOS & ORGANS, at EXTRAORDINARY LOW prices for cash. SPLENDID ORGANS 2 3-5 sets of reeds $65, 3 sets with Sub Bass and Coupler $80, 2 sets $50, 1 set $40, 1 set $35. 7 Octave *all* ROSEWOOD PIANOS $130, 7 1-3 do $140, warranted for SIX years. AGENTS WANTED. Illustrated Catalogues Mailed. Music at half price, HORACE WATERS & SONS, Manufrs. and Dealers, 40 E. 14th, St., N.Y.

USE THE PERFECT BUTTER COLOR! WELLS, RICHARDSON & CO.'S PERFECTED BUTTER COLOR is recommended by the agricultural press, and used by thousands of the very best Dairymen. It gives a perfect June color, and is harmless as salt. A 25-cent bottle colors 300 pounds, and adds 5 cents per pound to its value. Ask your Druggist or Merchant for it, or send for descriptive circulars. WELLS, RICHARDSON & CO., Prop'rs, Burlington, Vt.

My Annual Catalogue of Vegetable and Flower Seed for 1879, rich in engravings, from original photographs, will be sent FREE, to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. *Printed directions for cultivation on each package.* All seed *warranted to be both fresh and true to name*; so far, that should it prove otherwise, I *will refill the order gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables. I invite the patronage of *all who are anxious o have their seed direct from the grower: fresh, true, and of the very best strain.*
NEW VEGETABLES A SPECIALTY.

Reading for the Young.

SAVED.

THE wind is spent and the gale is past,
And the morning sun shines forth at last;
It shines on a strip of yellow sand,
And a good ship sluking in sight of land.

Over her deck and her battered side
Lazily washes the ebbing tide;
Out of the struggle and deadly strife
Lo! nothing saved but a baby life.

A wee frail thing is the one poor waif
A wee frail thing to be sound and safe;
But all forgotten its brief alarms
It gaily crows in the stranger arms.

A sailor looked at the little form—
"'Tis a tiny craft to have stemmed the storm!"
He sighs a bit as he bends him low,
And his thoughts fly back to the long ago.

Just such a babe on his young wife's breast
With clinging fingers his own caressed;
Just such another—but where is he?
Wrecked on the voyage of life, may be.

Is this but spared that in years to come
It may drift away from its heavenly home?
The baby laughs as his boy once did;
Ah, will it be so? Nay, God forbid!

The sailor's hand has a gentle touch
For the sake of the lad he loved so much;
And soft from his lips are the words that fall
"God bless the children—God keep them all!"

[Sunday at Home.

TEN QUESTIONS.

UNCLE TRUE.

My young relatives must have increased apace recently; and as the new comers have not done me the honor to write and explain that henceforth they consider me in the light of a dearly-beloved Uncle, I have concluded to break through my usual reserve and make the first advances. Among princes and potentates it is customary, when they venture abroad to make new acquaintances, to cement friendships with gifts. We all know how the Queen of Sheba overwhelmed Solomon with rich presents. Being Americans, we are, of course, all potentates, hence in making the acquaintance of my new nelces and nephews, I shall not present myself before them empty-handed. But then how am I to know that you are worthy of claiming relationship? I want none but clever and studious nelces and nephews. To ascertain if you can be catalogued under those heads, and moreover, to judge what progress my whole family has made in the school-room, I shall propose

TEN QUESTIONS,

and the one who answers the greatest number shall have my first gift, a book of humorous selections, called the "Rise and Fall of the Moustache," written by Mr. Burdette, the "Hawkeye" funny-man; and the second gift, a book of poems, shall be awarded to any one answering the second largest number of questions. The awards will be announced in the RURAL of January 18, with the names of the winners. Here are the questions:

1. Who wrote

Blow, bugle, blow, set the wild echoes flying,
Blow, bugle; answer, echoes, dying, dying, dying.

2. From what is the word Zoology derived?

3. How many square feet are there in an acre?

4. Who said

There is a pleasure in the pathless woods?

5. From what circumstance did the Roman, Brutus, derive his name.

6. Where did Jason go to get the Golden Fleece?

7. Name the Plagues of Egypt.

8. Who was the originator of the South-Sea Bubble?

9. What is the weight of the earth?

10. From what were the first plows made, and what their shape?

THE CHICKADEE.

AUGUSTUS FOWLER.

THE Chickadee (Paris atricapillus) is a common resident, familiar alike in the woods and the dwellings of man. He fears not the storms of winter nor the heats of summer. Cautious yet bold, cunning though seemingly simple, he averts all suspicion of the whereabouts of his nesting-place, and, when discovered, scolds the intruder. Ever on the alert, the hawk cannot make him his prey, nor the smooth gliding snake surprise him in his nest. In times of incubation when danger approaches, the male, before unseen, sallies forth and instantly appears before the intruder, hopping from branch to branch, keeping but a short distance from him, and remaining silent until he fears their retreat may discovered, then he sounds the alarm. At the the female peeps out of her abode, and quick-dodges back to await the issue. If their nesting-is not seen, or the male has artfully drawn the person away, the pleasing notes, Phe-be, Phe-be are heard; but if the nest is disturbed, and the female routed, they are clamorous in reiterating the notes, Pe-dee-dee-dee. If their nest is destroyed, they linger about a day or two, then go in quest of another suitable place to build again, such as a rotten stump or decayed upright branch of a tree or post, which is easily perforated, and dig a hole in it to the depth of six to nine inches, with a diameter usually of two and a quarter inches.

They are often many days in preparing their tenement. Their labors are commenced in the morning of each day, both male and female working, and they work until about the middle of the forenoon, when they stop, and are seldom seen about the premises until the next morning. It seems as though the task before them would depress their spirits and discourage them in their undertaking, but energy and perseverance will accomplish much: bit by bit of rotten wood is taken out of the hole and carried by each bird ten or fifteen feet from the tree and dropped on the ground. There is no delay in their work except what arises from the difficulty of detaching the particles of wood from the sides or bottom of the cavity; for each bird, after dropping its light load, flies back to near the entrance and waits for the other to appear, when it enters the branch instantly. When the hollow is finished the bottom is concave, as usual in birds' nests.

There is usually in the vicinity of the nest a hollow tree, or cavity made on purpose for the male to roost in during the time of breeding; such retreats are also occupied by them in severe stormy weather in winter, in which they sometimes remain three or four days in succession. They make their nests of different materials; sometimes it is entirely of cow's hair, at others entirely of wool; usually it is composed of various materials, such as those named, together with fine grass, the fine dried roots of the willow, etc., and lined with some soft material. Its inside diameter is one and three-fourths inches; its depth one and one-fourth inches. The eggs, which are commonly eight in number, measure in length nine-sixteenths of an inch, and in breadth eight-sixteenths of an inch. They are marked with reddish-brown specks over the entire egg, more thickly at the larger end; sometimes, however, the spots are thicker on the smaller end of some of the eggs of the same brood. They raise two broods in a season. The Chickadee, when compelled from necessity to take up his abode in a cavity not made by himself, selects one with an entrance not much larger than his body, so that he is not so liable to become the prey of the Mottled-owl, as are the Golden-winged Woodpeckers and Blue-birds.

There are no species of birds that suffer so much from the depredations of the Owl as the Golden-winged Woodpeckers. The deadliest foe to the Chickadee is the Great American Shrike, or Butcher-bird. Seated upon some prominent object the Shrike watches the movement of the little troop as they are busily engaged seeking their food in a variety of positions, unconscious of the sure death that awaits one of their number. While listening to the squeaking notes of the Brown Creeper which usually attends them, or the shrill clarion voice of Downy Woodpecker, you hear a noise like a falling stone through the branches of a tree; it is the Shrike: he has struck his victim, and if he does not devour it upon the spot, it is hung on the crotch of a branch to serve as a meal at some future time.

HOME-MADE DOLLS' HOUSE.

As many of our young readers are not in a position to expend any very large amount for toys, the following suggestions, which we gather from the Philadelphia Times, may be of service, and help to make the long winter evenings pass pleasantly:

A large packing case, divided into four compartments by two shelves placed crossways inside, makes an excellent doll's house. Any carpenter would fix these shelves and put on a door in front at a very small charge. The four compartments make a dining-room, drawing-room, kitchen and bed-room. The ceilings should be covered with white glazed calico, pasted on; this makes a good imitation of whitewash. Pale yellow calico pasted on the kitchen walls answers for the usual "distempering" of a real kitchen; this is less troublesome than painting or applying real whitewash, and looks quite as well. The calico must be strained as tightly as possible. The walls of the other rooms should be covered with paper. Carpets can be made out of pieces of velvet, or, better still, worked on canvas in a small pattern suitable to the room. This is a capital piece of easy work for a little girl. One great advantage in the doll's house as a toy is that, like a doll, it induces children to practice needlework. Real carpet is too thick for the doll's rooms, but drugget does not look amiss. Small pictures, cut out of papers or taken off bonbons, look well on the walls if surrounded by a narrow strip of gilt paper to imitate a frame.

Much of the furniture can be made at home. Beds are easily manufactured. Take an old note-paper or spool box, and place the lid upright against one end, the box being turned bottom upwards. This forms a bed, with a back and tester. Sew the lid firmly in its place, and paste pink glazed calico within and without, also along the sides; then cover with white muslin edged with lace, arranged like the curtains, draperies and valance of a real bed. A mattrass, stuffed with any scraps of wool or wadding, sheets, blankets (of flannel), counterpane and pillows can now be added. Silk patchwork is effective for the counterpane, or one can be knitted in fine wool on steel pins, in stripes of red and white. Lace over silk is very pretty for a counterpane.

Here, again, is an opportunity for the juvenile furnishers to exercise a little neat needlework.

A capital wardrobe can be made of another such box, without the lid. It should be lined inside with pink or white glazed calico, and covered outside with paper. Imitation oak panelling looks best. Stand this on one end, put a row of bent pins at the back, inside, for the dolls to hang their dresses on, and close the entrance by a curtain of some soft material (crimson llama or merino does well).

The curtain should be made to draw to and fro; this is easily managed by running a wire through a row of loops at the back of the curtain, and then fixing it across the door. If made in a soft material (silk is too harsh), it will draw easily.

Tables and chairs can be made in cardboard, but they are hardly durable enough to be suitable for the doll's house. If the family contains a brother with any taste for carpentry, he had better be applied to. Tables and chairs are easily made, even by amateur carpenters. If done neatly, it will be sufficient to paint the legs and backs to imitate whatever wood is desired—varnishing is a sticky and smelly operation, and hardly one to be recommended to young folks who have any regard for their own frocks or their parents' carpets.

Extremely pretty chairs can be made by covering the wood with strong gum, and then laying cut straw regularly side by side upon it till the chair is covered. Sofas without arm can be made out of an empty hook-and-eye box; turn the box bottom upward to form the seat, sew a piece of card against one side to form the back, and cover the back and seat first with a thin layer of wadding, then with silk, velvet or chintz.

A doll's house, such as described, is a toy in which all the children can take an interest, even the boys being useful in making it. Where such a toy is known to exist, friends and relatives who wish to make presents to the little ones generally let their gifts take the shape of some addition to the doll's house, which often grows surprisingly rich in the course of years. Glass and crockery, which cannot be made at home like the furniture, are frequently supplied in this manner. I omitted to mention a wash-stand among the bed-room furniture; a table does well for this, the top covered with a thin white oilcloth or marble paper. A toilet table should be covered with pink calico and draped white muslin, to match the bed.

Ingenious children will invent many other additions to the furniture—the doll's house is a capital holiday occupation. Of course it may be said that toy furniture is to be bought so cheaply that it is hardly worth the trouble of manufacturing at home; but the object of this paper is rather to find occupation for restless little fingers than to give instructions how to make articles which shall eclipse the gorgeous doll's furniture at any first-class toy shop. Doubtless prettier tables and chairs can be be bought, but the handmade ones gives amusement for many a wet afternoon, and their manufacture fills up many an idle hour.

THE great French novelist, Victor Hugo, tells this story about his own childhood—his father, be it remembered, was one of Napoleon's generals: "When I was five or six years old I was crying. My father who heard me, did not reproved, me but this is the way he punished me, 'Why, the poor, dear little girl,' he said in a cool, ironical manner, 'what's the matter with her? Who has been making her cry? She shan't be found fault with; it's right for little girls to cry. But how's this? What have you been dressing her in boys' clothes for? Make her a pretty frock at once; and to-morrow she shall go and take a walk in the garden of the Tuileries."

LETTERS FROM BOYS AND GIRLS.

From Lilly Lee.

DEAR UNCLE TRUE:—I see that some of the dear Cousins are alive yet. I was very glad to see their names in your columns. I expect they were very busy in getting ready for Christmas. There is lots of fun at Christmas. I like to fix up the rooms, trim them with wreaths and ferns, and make them look so bright and pleasant; and it is very nice to make pretty gifts for our dear friends; as I expect they enjoy their presents just as much as I do those I receive. It is pleasant, not only at Christmas, but always afterward, to look at them, and think of the dear friends that gave them. I remember the first time I hung up my stocking for Santa Claus to fill. Can any of you remember your first time? My stocking was red and white; and I went to bed early and listened so long to hear the reindeers come clattering down the chimney. As soon as it was light, I scrambled out of the trundle-bed, and ran for my stocking. It was stuffed full! That was a Merry Christmas for me; and mother went to put on her boot, and there was something in the toe. She took off the boot, shook it, and out came a live mouse! Oh, how I jumped and laughed; but I thought it was rather shabby in Santa Claus to give me so much and treat my mother so ill. Well, that seems a good while ago, and I have lost faith in Santa Claus, because some one told me he was a humbug. But he was a very pleasant cheat. I wish the girl cousins would tell me, in Uncle True's paper, what they received for presents, and how they made those they bestowed upon others. It would be so nice to learn something new.

LILLY LEE.

Our Cobbler.

ON a farm near our place there is a fine white gobbler, whose business heretofore was mainly to gobble, strut, admire himself, and take charge of the young turks when hatched. The season being cold and disagreeable for young turkeys all departed this life but one, and this one the afore-mentioned gobbler took charge of. But one night the little turk came home alone with his old mother, and the old gobbler was reported missing. Nor was the mystery unravelled for several days. One evening some one thought he saw him walking in the field with the hen; but instead of coming home to roost he disappeared. Search was made, and finally he was found under the hedge undergoing the hardships of hatching a nest of eggs! He has proven himself, not only useful as well as ornamental, but carries off the palm for gobblers.

YOUNG TURK.

Her Favorite Cousin.

DEAR RURAL COUSINS AND UNCLE TRUE:—My papa has taken your interesting paper for some years. We are all very much pleased with it, indeed I do not know what we could do without it. Can anything be done to revive the hearts of our gentlemen cousins. I feel very sad about them. The girls have chased them out of our sociable circle almost altogether I should judge. The boys pretend to be very brave, but when the girls rise up against them, and with the aid of the pen make them acquainted with the fact, they beat a hasty retreat. Poor, cowardly fellows, my heart aches for them! Slayer-of-conceit where are you? I wish you to know that you are my favorite cousin. Perhaps you will again venture to write when you find you have a friend among the girls; for with sorrow I confess that I belong to the conceited fair sex.

"RURAL LOVER."

Sabbath Reading.

THE SOWERS.

"All Seed is in the Sower's Hands."—Rosetti.

TEN thousand sowers through the land
Passed heedless on their way;
Ten thousand seeds in every hand,
Of every sort had they.
They cast seed here, they cast seed there,
They cast seed everywhere.

The land a forest straightway grew,
With plants of every kind;
And kindly fruits, and poisonous, too,
In that world could you find.
For trees grew here, and trees grew there,
And trees grew everywhere.

Anon, as many a year went by,
Those sowers came once more;
And wandered 'neath the leaf-hid sky,
And wondered at the store.
For fruit hung here, and fruit hung there,
And fruit hung everywhere.

Then plucked they many a berry bright,
None could their right deny;
And some ate to their long delight,
And some ate, but to die.
While some plucked here, and some plucked there,
And some plucked everywhere.

Nor knew they in that tangled wood
The trees that were their own;
Yet as they plucked as each one should,
Each plucked what he had sown,
So men do here, so men do there,
So do men everywhere.

CALL ON YOUR PASTOR.

VERY many parishoners make a sad mistake by neglecting to call on their pastor and his family. They think, perhaps, all belongs to him and his wife to make all the calls. But such is a grave mistake and should be corrected. Judgment, it is true, should be exercised in this matter. Lengthy calls should be avoided, and calls on Saturday not often made unless on special business.

But there are times when calls by parishoners would be highly appreciated by a pastor and his wife. Try it, brother and sister. Perhaps you have not called upon your pastor for six weeks; it may be six months. It may be a whole year, and so you do not know how they appear at home in their own family. And neither do you know how he and his family fare in temporal things. You wonder, perhaps, why Mrs. A why, the minister's wife, don't go to church of late; why she is not a teacher in the Sunday school; why not to the circle and other places of entertainment. Yes, why?

Go immediately, and learn why. If she is too modest to tell you the reason why, then gently inquire something about her apparel, and perhaps you'll be led into the secret of her absence. Be careful that she does not disguise the fact that she is very needy, with no means to relieve her necessities. Call on your pastor and family and cheer them by alms-deeds, and show that you appreciate his labors, and esteem him highly for his works' sake.

A short call on your minister and a few words of cheer in commendation of his sermon the past Sabbath may lift a heavy burden from his aching heart. For often his sermons to him seem very poor, and not in time nor place, when, perhaps, it was just the meat which fed you. Don't be afraid of puffing him up by speaking in a proper manner of his efforts to feed the hungry souls. If you were fed by the truth presented, tell him so, and speak of it in the prayer-meeting.

If you would call on your pastor and family, it would be reciprocated. You would see him more frequently at your home, and there would be stronger attachments created, and there would be a better understanding between pastor and people, and a strong bond of love and union fell.—Morning Star.

FEAR OF HUMAN JUDGMENT.

I AM just going to do something which I have clearly made up my mind to do, and some friend passing by catches sight of me, standing with the tools all in my hands, and on a mere momentary impulse he cries out, "What a fool you are to do that!" and so passes on and has forgotten me and my plan in a moment. And yet it is just that sort of taunt, or the fear of it, which has blighted many a sweet and healthful impulse in the bud. It is good for us often to know how superficial, how lightly made, how soon forgotten, are the judgments of our brethren which sound so solemn, and which tyrannize over us so. Such a feeling sets us free, and makes us independent. Be sure that you may feel that about any cruel criticism that is hampering you, and may cast it aside, and forget it, and go your way. The man who made it has probably forgotten it long ago.—Phillips Brooks.

PERSONAL CHARACTER OF JESUS.

IF we attempt to discover what it is in the personal character of Jesus Christ, as shown in His life, that thus attracts such permanent admiration, it is not difficult to do so. In an age when the ideal of the religious life was realized in the Baptist's withdrawing from men, and burying himself in the ascetic solitudes of the deserts, Christ came, bringing religion into the haunts and homes and every-day life of men. For the mortifications of the hermit, He substituted the labors of active benevolence; for the fears and gloom that shrank from men, He brought the light of cheerful piety, which made every act of daily life religious. GEIKIE.

CHRISTIAN, though the cup is bitter, yet it is put into your hand by your Father; though the cross is heavy, yet he that has laid it on your shoulders will bear the heaviest end of it himself; and why then should you murmur?

PERSONAL ITEMS.

Mrs. McNulty of Montreal, gave birth the other day to triplets—two boys and a girl. She named them Lorne, Louise, and Victor.

The King of Bavaria is erecting at Herren-Chiemsee a royal chateau, on the plan of that of Versailles. The building is to be spread over fifteen years, and the estimated cost is $9,000,000.

Lord Dufferin has declined a marquisate tendered to him, and will instead be promoted from his Knight Commandership of the Bath to the dignity of Knight Grand Cross of the same order.

Mr. Gladstone has a daughter who is familiar with the place of every work in his library and the run of its contents. When he desires a reference, she instantly fetches the book needed, and points to the passage required.

"Dawson, I should like to get a retriever," said the Duke of St. Albans to the great London trainer of race-horses, at the close of the racing season. "If I come across a good dog I will inform your Grace," replied Dawson. "I don't want a dog." exclaimed the Duke; "a horse is what I am after, to retrieve my losses on the turf."

One of the most astonished boys of the period lives in Rondout, and may be known as B. J. R. Smith. He had heard that powder would burn, and wishing to make the fire blaze, he poured the contents of his father's powder horn upon the coals. He will not kindle any more fires this winter, for the flowers will come again before he recovers.

Capt. Buchanan of Winston, N. C., disliked his daughter's suitor, Jerry Sheldon, and forbade him to come to the house. Jerry went, however, and immediately found himself in the old man's grasp. After a brief combat, Jerry threw the Captain down and held him there. The Captain called his servant girl and told her to get a gun. She obeyed. Then he ordered her to shoot Jerry. Again she obeyed, and Jerry was killed.

There has long been a mystery thrown around the early antecedents of Miss Mary Anne Evans, better known by her pseudonym of "George Eliot." It now appears from a sketch headed "Our Native Land," that she is the daughter of the late Mr. Robert Evans, bailiff to Lord Howe and to Sir Roger Newdegate, at Cotow, near Nuneaton, Warwickshire, and sister to Mr. Isaac P. Evans, who now holds the same position.

Proof that Abraham Lincoln was in 1858, a railroad deadhead, exists in the following letter written by him, on file in the Chicago and Alton Company's office: "Says Sam to John, 'Here's your old rotten wheelbarrow. I've broken it usin' on it. I wish you would take it and mend it, 'case I shall want to borrow it this afternoon." Acting on this as a precedent, here's your old 'chalked hat.' I wish you would take it and send me a new one." What Lincoln wanted was a renewal of his annual pass.

The great historical painter of the Revolution and the First Empire, David, once publicly exhibited a picture of large dimensions, one of the principal figures in which was an unbridled horse. With the pardonable vanity of an artist, he mingled with the crowd gathered before the painting. The spectators, with one exception, expressed unbounded admiration. The exception was a hackney coachman, who exclaimed disdainfully: "A precious painter, this David, to pretend to paint horses! Why, he's got one of his jaws all over foam, and no'er a bit between his teeth!"

In view of the fact that our Canadian friends are about to be blessed with a vicarious sort of Royal Court, it may be of interest to know that a new species of scandal has turned up in England. A lady of rank in London undertook to pay a tradesman's bill by presenting his wife at court, an honor of which she was most ambitious, but which etiquette forbids to the wife or daughter of a shopkeeper, however wealthy, refined, or well connected. At the last moment the Chamberlain found out who she was and refused to receive her. The lady says she performed her part of the condition. The tradesman has sued for his bill.

Wit and Humor.

BROTHER GARDNER'S LIME-KILN CLUB.

"GEN'LEM, if you see a pusson rushin' 'roun' de world enveloped in a dimund pin an' an ulster, am dat any sign dat he pays taxes, rents a church pew an' brings his chil'en up in de way dey should go?"

Brother Gardner looked down upon the sixty-four faces in the orchestra chairs, but not a voice responded.

"When you see a pusson seated in a sky-blue cutter, pushin' de lines over a fast hoss an' lookin' outer his left eye as if he had de bulge on all de co'ner lots in town, am dat any sign dat a single grocer would trus' him for a box of sa'dines or a peek of carrots?"

The elder Toots heaved a deep sigh; and Huckleberry Jones silently scratched his off leg just below the knee.

"When a man takes up fo' seats in de kyar, pushes folks 'aroun' on de market, elbows aroun' de city hall, an' gits de fust place at de stamp-window in de post office, am dat any sign dat when it came to de pull he'd give half-a-dollar's worth of wood ter keep an orfun asylum from freezin' to death? Doan' you black folks git dust in yer eyes! Dar's a heap of sand an' sawdust in dis worild dat passes for sugar to de man walkin' by, but when you come to de pinch de sugar aint dar. De sawdust bulges up an' de sand creeps out, an' you am dis'pinted an' disgusted. It's kinder hard to have to eat cold turnip when you know dat de family next door am luxuriatin' on sweet-cake an' turkey, but if de turnip am paid for yer needn't fear for yer digestion. I expeck dat de h'arafter am de biggest fing enny of us hev got to work fur, an' I tole you, brudders, dat big seal-rings an' pants cut twenty-two inches across de kull are nowhar' longside of a kin' word an' an honest heart."—*Detroit Free Press.*

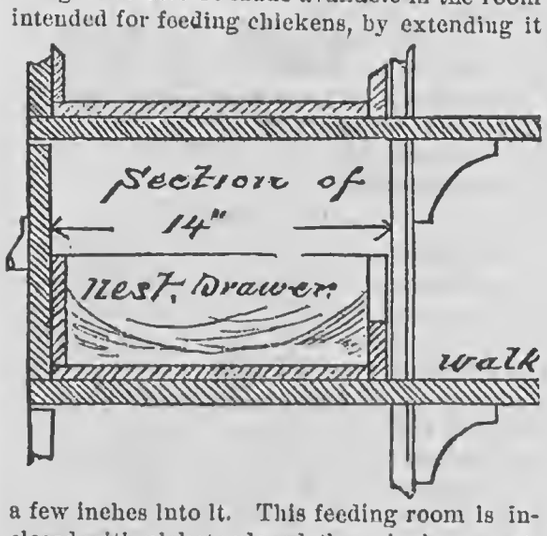
Rural Architecture.

DESIGN FOR A HENNERY.

PALLISER, PALLISER & CO., ARCHITECTS, BRIDGEPORT, CONN.

THE accompanying design fully illustrates a hennery 16 by 20 feet, arranged in two sections, so that two kinds of fowls can be kept in it and be entirely separate. The building is large enough to accommodate about 75 fowls; the nest boxes are so arranged that they can be drawn out into the passage for the purpose of getting the eggs, and when not needed in laying time, can be put in the reverse way and shut off the inside. This can be done if they are used for sitting hens.

The feed bins are so arranged that they are filled at the top from the small loft floored over the hall, fattening and setting room. This loft would, no doubt, be found useful for storage purposes generally. The feed bins being filled from the top, let their contents out into small troughs in the hennery, thus working automatically and taking care of themselves as long as the feed in them lasts, while the food is kept clean, as the troughs are raised above the floor, while a perch is placed in front of them for the fowls to sit on while feeding. The water trough is arranged in like manner, and has a partition over the center dividing it into halves. A running stream could be arranged which would insure pure and wholesome water at all times, a convenience which would contribute materially to success in keeping the fowls housed and fed in the building. This trough can also be made available in the room intended for feeding chickens, by extending it

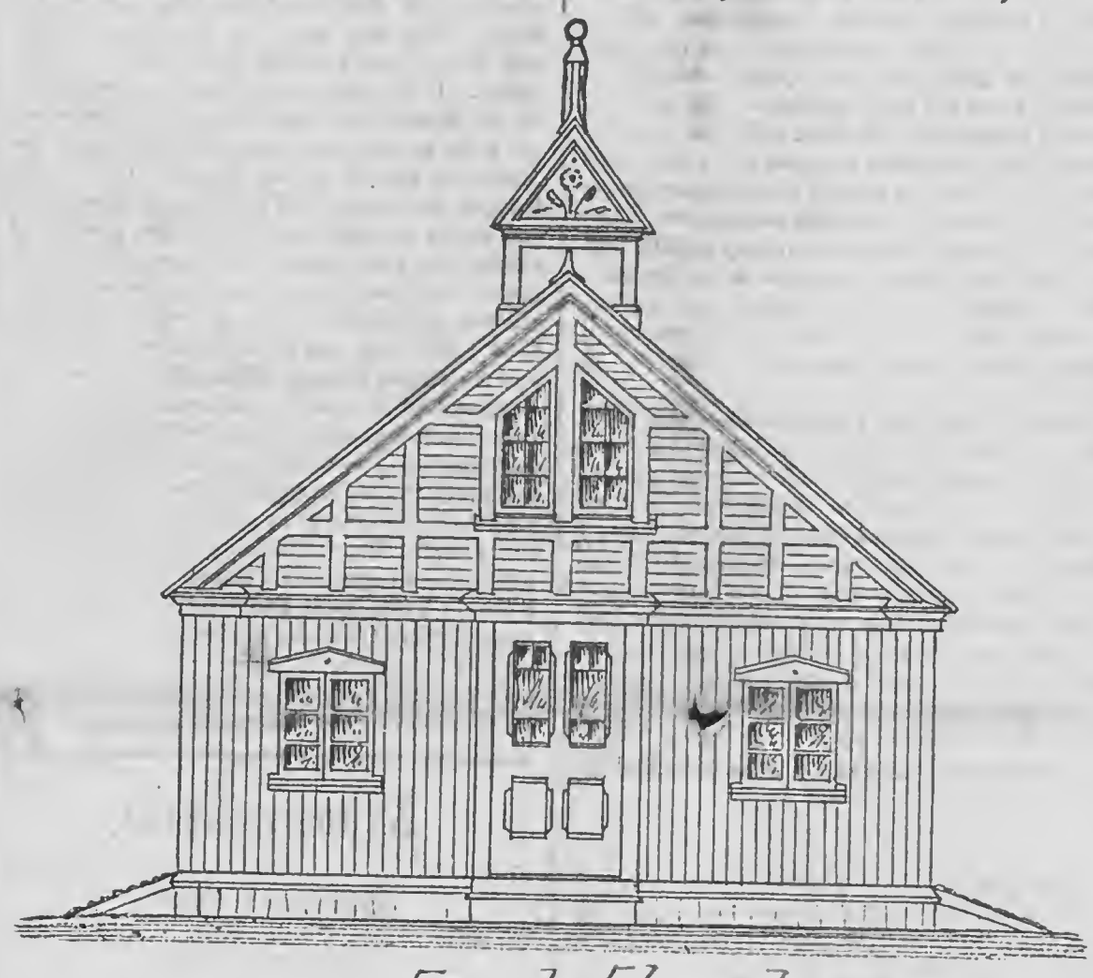


a few inches into it. This feeding room is inclosed with pickets placed three inches apart, and covered by the sloping boarding over the nest boxes and under the perches, as shown in cross section and at dotted lines on plan, p. 23.

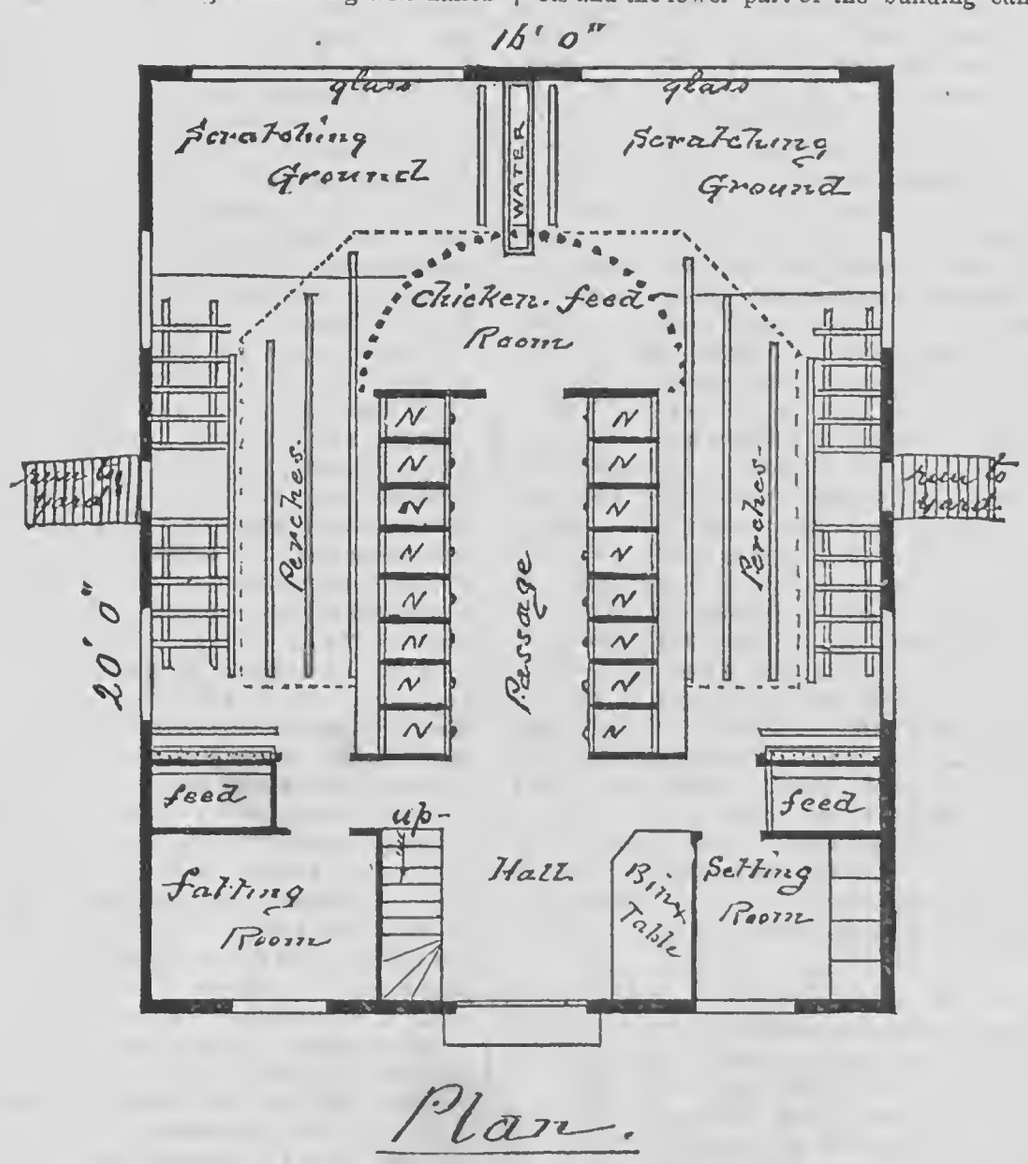
The frame-work of the perches is hinged at the top and arranged with hooks so as to raise and hang them up to facilitate the cleaning of the boards underneath. There are runs up to small platforms which extend from the doors leading to the yards to the first or lower perches. These runs are placed both ways, starting from scratching ground and feed trough. The small doors to the yards should be arranged to slide, and have cords attached to them so as to be opened and shut from the hall at pleasure.

The side walls of this building are 6 feet 6 inches high, and should be sheathed on both sides up to plate level, with narrow matched boards placed vertically, having a two-inch air-space between, which when filled with mineral wool, would render it rat, frost and vermin-proof, at a trifling expense. The roof should be shingled in the ordinary manner on slats. To regulate the draft, the ventilators should have shutters which can be operated by cords from the hall. The top shelf over nest drawers makes a handy and useful place for laying away many things when not in use, while the bin, as arranged to right of entrance, will be found useful both as a bin for meal and as a table when the lid is shut down. The windows should all be arranged to slide sideways into the walls, the outside of openings to be protected with heavy wire netting meshes about ½ or ¾ inch apart. Thus the sashes could all be pushed out of the way in summer time, which would make a very airy room, as the ventilation would be excellent. The scratching ground should have a good cement or brick-paved floor six inches below the other floor, and should be filled in with soil which can be removed and fresh substituted as often as desirable. The rest of the floor should be laid with good flooring well nailed down, and have a coat of tar and pitch about a quarter of an inch thick, on which a sprinkling of soil about one inch deep can be put. The pitch fills up all cracks, etc., and effectually closes any draft through the floor, and is a good preventive of vermin.

Such a building as this, if built in good shape, would cost but a very small amount, and would be a good investment as well as a source of joy and amusement to any lover of good poultry, and would fill up the spare moments which might be otherwise wasted. A yard on each side can be fenced in with pickets and the lower part of the building can be hid by bushes, trees and shrubs in the garden. The upper part would form a very nice and picturesque object in the landscape, which would be always pleasant to look at.



Front Elevation



Plan.

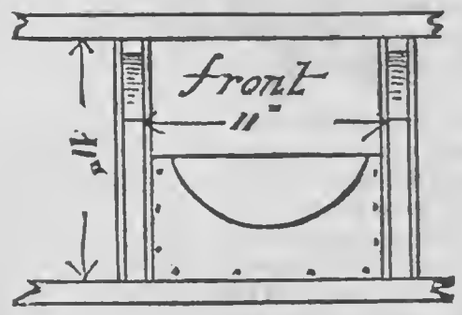
Farm Topics.

THE OUTLOOK FOR YOUNG FARMERS IN THE WEST.

PROFESSOR G. E. MORROW.

WHAT are the prospects for young farmers is a question in which, at the least, one million of persons in the United States have a very direct, personal interest. The welfare of all classes, and the continued prosperity of the nation very largely depend on what the future shall prove to be the correct answer; but for the enormously large number of young men and young women who are either already engaged in farming or are seriously thinking of adopting that as their business, no question possesses greater interest. It is not a matter of so much moment what are the prospects for the next year, or for the next five years—important as this is; but what is the outlook for a long series of years, for the quarter or third or half of a century these young people may hope to live and work, this is a question to which we may well give our closest attention.

No one of us is a prophet; we can only foretell the future by a study of the present and the past. The most casual observation shows the agriculture of the country, certainly of the West, to be in a depressed condition. Current discussion in public and private, shows that many farmers are discouraged and somewhat despondent as to the future—and there is reason for this. Prices for farm products of almost all kinds are very low; low in comparison with what they have been in past years, and low in comparison with those of articles to be bought by the farmers. Farm lands are low in price. Many of them cannot be sold for



nearly as much as they were purchased for during the recent inflation of prices. Many farmers have accumulated little or nothing for some years; but, instead, have found the money needed for interest and taxes more than equaling what they could make each year. In the aggregate a very large number of farmers in the West have been compelled to give up the farms on which they had lived for years and for which they had partly paid; and still others must look forward to this as the inevitable ending of their present struggle. Judging from the present alone, we should not predict a bright future.

If, throwing out of view the present and the more recent past, we look only to the general past of agriculture in this country, we would make a too favorable prediction for the future; for, to a degree we do not always realize, agriculture has been wonderfully prosperous in this country, with a comparatively few and these short, exceptional periods. I do not know when or where in all the world's history, there has been an equally rapid accumulation of property and of the accompaniments of civilization as that which has been going on in our Western States during the last third or quarter of a century. It is almost like a fairy tale—a land where almost anyone, given only health and industry, could begin with a mere pittance and at the end of a score or two of years, find himself the possessor of a comfortable competence. Yet this has been the experience of scores of thousands. Men have come from other countries to a soil and climate and a system of farming of which they knew almost nothing; where even the language of the coun-

try was unknown to them; men from the peasant classes, with little or no education from the schools, and little experience in business; yet with all these disadvantages, the very large majority of these men have not only lived, but have become comparatively rich; certainly rich compared with the position they could have hoped to have reached in their native lands. Thousands on thousands of farms purchased at $1.25 per acre, have grown to be worth $20 to $50 per acre, and in the interval have comfortably supported their owners. The streams of immigrants from other countries, and from older States of this country, have no other explanation so good as the fact that, in the general past, success has been the rule and failure the exception with the farmers of the West. An accumulation equally rapid I do not expect in the future, unless in comparatively limited regions.

So, then, the present is a present of hard times to farmers, and the past we cannot hope to be reproduced. Is, then, the outlook a dark one? I do not so see it, but confidently expect a steady, though not rapid improvement in the condition of the farming class of the West, and that, in any considerable series of years, agriculture will be found to give as good returns to those who intelligently and persistently give their attention to it, as will any of the great industries of the country.

This is not a mere blind assertion, but is one made for what seems to me sufficient reasons. And first, I give much weight to the broad proposition that, in the nature of things, a great industry, one absolutely essential to the human race, will not long remain in depression, in any free country well adapted to it. Farming is the basal industry of the world. We cannot conceive of circumstances in which it will not be necessary for a very large part of the race to be farmers. The West is well fitted for the production of the great agricultural staples. The conclusion seems a natural and inevitable one.

Again, it should be remembered that, bad as times are and have recently been for farmers, they have only shared these hard times with men in other callings, and that many other businesses have suffered more than has agriculture. Not only is it true that farmers are not the only men who have suffered, but it is also true that this is not the only country that has suffered. British farmers are to-day in a worse condition than are those of America. For all this depression there are causes, and it can hardly be that these causes are to continue to act with equal force. We can clearly see some of the causes which brought disaster to the business interests of this country. Many of these naturally followed the war. The road out of the mistakes that were made, along which the unavoidable losses of that period have had to be made up, has been a long and a hard one. Many have fallen on the way. But we are getting to the end. It is very hard for the many who have lost, or will yet lose, their homes; but with their places taken by men with more means and who will secure their farms at unusually low prices instead of unusually high prices, the country will be in a better condition.

Still, again, there is very much encouragement in the fact that, bad as times have been, there has not been a year, including this year, 1878, with its remarkably low prices, in which farmers who were out of debt have not made at least a small profit. Not all farmers have done this, but some have; and if this has been true during all this time of depression, it surely gives good promise for the future; unless we give up in despair and say that gloom and disaster and distress are to be the permanent condition of the country.

This is not the place for a discussion of national financial problems or policies; but whether the policy of the Government has been wise or unwise, it seems reasonably certain that the fluctuations in our currency are about at an end, and that in the future we can have a surer basis on which to make calculations. If this prove true, the owners of unemployed money will seek to invest it. I believe many of them will invest not only in farm lands, but in farming operations, and I can see no reason why investments in good farming lands in the West should not be almost absolutely safe and certain of giving a fair profit, at the prices at which they can now be bought. This investment of capital will bring relief in many ways.

In the past, Western farmers have, generally, looked mainly to the increase in the selling price of their lands as the source of profit. The inevitable tendency of the great tracts of low-priced lands in the West rapidly filling up and rising in price, has been to make farmers careless as to their farm work. Especially in the older portions of the West, a change must come. In the future, profits from farming will come more from the farm products, and the increase in selling price of the land will grow a less and less important factor—hence great profits are not to be expected. No sure business can give great profits for any long time; else it would certainly attract to it an over large number.

It should also be borne in mind that competition is constantly increasing, the number of farmers is becoming so large, and the aggregate crops so enormous, that where to find a market is not always easily answered. It is to be set over against this that the proportion of our population who are not farmers is rapidly increasing. Each successive census will show a larger part of the total population living in towns and cities, and engaged in manufacturing, merchandising, or other callings making them consumers rather than producers of farm products. It is also a hopeful sign that not only are our agricultural exports rapidly increasing in quantity, but that they are in much greater variety than formerly. We must continue to export largely of agricultural products, for our production is already enormously in advance of the possibilities of home consumption. It is an essential to prosperity that we see that we not only produce, but that we produce those things which are most in demand by other countries and as many such articles as possible. The recent development of the export trade of meat, animals and fresh meats, and the great increase in the exportation of dairy products and other articles in which manufacturing skill is added to the ordinary work of the farmer, are most important steps in a right direction.

These statements, if they be true, lead to some important conclusions. The ignorant, careless man; the man without training of the mind and without skill in his art, will not succeed in conditions where competition will be much sharper than it has been in the past, and, where he must make his profit mainly, or wholly, from his farm products. He will not be well adapted for the nicer skill and the better business judgment necessary for the production of a greater variety of the higher forms of farm products. For such men success is not to be so generally the rule; it may well be that for such men, failure will come to be the rule. More capital in money or skill or knowledge, or in all these, is to be needed for successful farmers in the future than has been needed in the past.

I count it sure that young farmers well fitted for their work will, as a class, succeed as well as their fellows in any other calling; will receive a good return in money, and will be honored and respected by their fellows. But I count it equally sure that special, careful training of the mind as well as of the body, something more than the acquiring of mere mechanical skill, is to be an increasingly important element in securing this success.

Illinois Industrial University, Champaign, Ill.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

THE pigs, we did not know it before, are so fond of parsnips that they have rooted ours all up, and so we shall be short of this vegetable change in the spring.

Is it, or is it not economy to feed horses corn in the ear? We have practiced it for a number of years, believing that the portion which was not masticated, and so passed out of the horses without being digested, was not equal to the miller's toll. The toll is every tenth, and this with the waste and time spent in going to the mill, will make it fully equal to every eighth. Another thing farmers do not think enough about; suppose every tenth is not masticated and assimilated by the horse, it is kept on the farm; whereas, if it is left at the mill, the farm is so much depleted of plant food. We throw the whole ears into the manger and let the work horses bite the kernels off as they like. As soon as horses get used to eating corn, there is no danger of its producing any colic or other derangement of the bowels, but care must be taken not to begin too strong at first. Three or four ears of Flint corn are all a horse should have to begin a diet of this food. The Southern and Western corn is lighter and is not so apt to produce colic. In the South corn is almost always fed in the ear, and so it is in the West when fed at all. Corn is excellent feed for horses to work on; but not so good for fast driving. They are more quiet and tractable on corn than with any other grain, and will do more hard pulling and drudgery with less loss in condition. Oats make a horse sprightly and active, and hence should be fed sparingly to a colt. Oats have helped to make a great many balky, spavined, and run-away horses. Corn makes them dull and slow, but strong. Corn is the best for colts while being broken. It may be made lighter, and not so heating by having wheat bran mixed with it.

We tried it last year, and it worked so well that we shall do the same thing again—winter the big colt on oat straw and buckwheat bran. He will keep fat on this feed and healthy. A rackful of straw three times a day, and four quarts of the bran are ample. The bran is worth $12 a ton, and will weigh 20 pounds to the bushel. This will be 2.48 pounds for a feeding or 7.44 pounds per day, which would be four cents and forty-six hundredths of a cent, certainly a cheap feeding for a colt seventeen hands high. He is kept in a warm stable; put this down for 25 per cent. saving in the keeping. The above is a stable diet and not calculated for work. It is good for growing colts.

A young pig ate too much corn, got too fat and constipated, and was found in the pen in spasms. An injection of warm water was administered, which brought away a few lumps of excrement very hard and dry. A tablespoonful of castor-oil was given and the pig put into a hot bath. The treatment was what the disorder required; but the constipation had gone on so long that inflammation of the bowels had begun, and the pig died. Another one had died a few days before, but not until the skin beneath and around the body had turned black, owing to the inflammation. The feed of the remaining pigs has been changed to barley meal, which is more laxative. Corn is too hearty for young pigs and too heating. Oats, unground, are far preferable, and barley meal is the best of all.

The pigs got sick while we were at the great dairy fair in New York. There was so much mutual admiration and glorification at the Exhibition, that we are afraid the business of cheese making, and butter, too, will be overdone. The same week of the fair the New York market being glutted, had 91,000 cheeses thrown upon it and only 20,000 shipped abroad. Poor cheeses are worth nothing, and are being piled up in the storehouses in vast quantities. Only the best are sent to Europe, and these are a small percentage of the whole. If we keep on stimulating production by big figures, big speeches, or big factories, we must at the same time manage to get the American people to eat cheese. This is the thing to do to get rid of the cheese. Americans eat, on an average, but four or five pounds of cheese for each person in a year. Cheese is eaten now only as an appetizer or a dessert, whereas it should be eaten as a staple article of food. But how can we dyspeptics do this unless the cheese is made differently? It must be at least half digested by the rennet in the process of making, and then our feeble gastric juice may finish it; but as it is now made, our digesting functions are unequal to the task. Soldiers may do it, but the army cannot eat up the surplus even if cheese is made a ration. We have heard a great deal about cheese for the English market; let us hear and see something about *cheese for the American stomach*.

It was 28 hills of chufas which produced a half bushel of nuts, and not 78 as printed.

Arboricultural.

EVERY-DAY NOTES.

SAMUEL PARSONS.

Tree Roses.

FEW plants are more generally admired and more persistently abused than Tree Roses. A natural inference from this would be that there existed in this case very bad qualities mixed with very good ones. Doubtless this is true. But the trouble is that one class of people will persist in discerning only the good and another only the bad. Perhaps this is no more than might be expected. Persons who fail to grow Tree Roses successfully, berate them. The successful—a small band, we fear—and those whose admiration is born of sight only, without experience, of course will praise them. As in most cases, the truth lies somewhere between the two. True, good and shrewd men assert that three-quarters, yes, nine-tenths of all Tree Roses sold throughout the country die the first winter after the season during which they were planted. This is doubtless a very broad assertion, one difficult to prove, but there can be no question that Tree Roses fail alarmingly throughout the Northern States. Now we, all of us, admire a Tree Rose when it is healthy and has developed a great mass of green leaves and numerous large flowers. On the summit of its tall stem the effect is certainly charming.

Desiring Tree Roses, the questions therefore for us to answer and to act on accordingly, are: Must we replace defunct plants every year? or can we by any simple treatment preserve them healthy during a long period? To the first we say unreservedly and positively, we need not replace them every year. To the second question, we say, yes, on conditions. Let us look at these conditions. The Tree Rose is grown in an unnatural fashion. No Rose would grow naturally on the top of a high stick, and it is only the art of man that can make it do so. The stem is, nevertheless, destroyed and cracked by the sudden and intense suns of America, and the junction of the cion and stock is severed by extreme cold the first winter their somewhat abnormal union is exposed. All this makes the Tree Rose a plant to be well looked after under the best circumstances.

What, however, is the course pursued and conditions created in importing them, for they are not grown here? Impatient purchasers demand their shipment from Europe in fall, before the growing wood is mature. They arrive in this country during late September and early October, are sold and planted, in many cases, the same fall, and die during the winter, as a matter of course. Wise buyers obtain, later in the fall, Roses grafted with hardy varieties (Remontants, &c.), keep them in a dark cellar all winter, and plant them out in the spring, pruned in sharply. During the summer, they moss the stem, and during the winter, bind it with straw disposed loosely about the head. Thus managed and pruned systematically every spring, Tree Roses may and do succeed. Do not on any account condemn them, but look upon them as choice and beautiful plants which need and merit much careful treatment.

Tree Pæonies.

Most people know Pæonies and admire them. Their immense blooms present a mass of color that no other hardy flower can perhaps, surpass. They are hardy, moreover, farther north where the Rhododendron fails as well as many other rich-hued flowers. This admiration is therefore well merited, but is it discriminating? Do people realize that one Pæony is not as another, and that there is a group of Tree Pæonies, as different from the herbaceous Pæonies as nature apparently could make them, if we except a certain similarity in appearance. One is very slow-growing, almost dwarf; the other springs in a season to massive size. One is difficult to propagate, difficult to transplant and choice in the highest degree; the other is increased by division with the greatest facility; is easily moved, and is, moreover, well known to every one. Wherein lies the difference between the two is consequently hard to define, and yet you would see a decided difference if the two were presented to you side by side. Perhaps no expression of it can be clearer than that afforded by their familiar names. One is dwarf, with firm, enduring wood; the other herbaceous, or not wooded in the technical sense, but soft in flower and foliage branches. Experience, indeed, soon teaches distinctions, such as peculiar colors of the flowers and generally, a more refined nature, if I may use the expression.

The Tree Pæony has many varieties beautiful in color and form, yet few learn the real beauty of these varieties, for nurserymen usually only sell Pæonia Banksii. Although this is a good kind, one familiar with its appearance alone can have little conception of the more highly developed charms of other varieties of Tree Pæonies. Pæonia Banksii, since great numbers of it exist throughout Europe, can be increased by division of the roots with comparative ease. The choice varieties are, however, too rare for the slow process of division. They must, therefore, be grafted, but this is difficult, and the difficulty of the operation will probably long keep the best Tree Pæonies rare.

One office, that of ornamenting small city lots, these Tree Pæonies are specially adapted to perform. They are dwarf, hardy and long-lived and very bright in color of flowers. It is to be hoped that their employment may become generally popular.

The French Mulberry.

It pleased me recently to see that the RURAL was offering in its free seed distribution seed of this attractive shrub. Scarcely anything is more admirable in its way. Of course, there is nothing very grand about it, but it answers the purpose of a moderate-sized shrub, for late fall, so well that it must always be popular. Indeed, as people come to set higher value on ornamental fruit-or seed-bearing plants in fall, it must gain still greater favor. Are RURAL readers generally aware that two Callicarpas are grown in gardens, which are very dissimilar and yet sometimes confused? The finer one, and perhaps the one best known is Callicarpa purpurea—the one to which my previous remarks have referred. The other is a large, coarser variety, somewhat exposed to winter-killing, but sure to come up again every spring. Although it is thus semi-herbaceous, it is well worthy of culture.

NOTES FROM THE RURAL GROUNDS.

ABOUT HEMLOCKS.

From our window we can count over twenty different species of evergreens. We will suppose that one of our readers asks the question: "Which would you prefer could you have but one?" Our answer is: "The common Hemlock (Abies Canadensis) and we give this answer without any "ifs" or "ands." There are many others that may be preferred for a single reason or so. For instance, the Sun-ray Pine as we have called it, (Pinus Massoniana var.) is now as yellow as gold itself, excepting the tips of its needles, which are green. The common Balsam Fir during the entire winter maintains a brighter green than almost any other conifer. The Menzies's Spruce is of a sea-green color, or what is termed "glaucous" by botanical writers, and is a fresh, pleasing shade. So, likewise is the Scotch Pine in most

soils. We might mention a marked feature in any one of the rest. But more can be said in praise of the Hemlock than of any of the others, and when we come to tell its defects we are at fault. For this climate and situation it has no defects.

The Norway Spruce and its many varieties are cumbrous and stiff. The Austrian and Scotch Pines are stiff and coarse. The Balsam Firs grow gaunt as they grow old. The Arbor-vitæs are formal and, in winter, brown. They appear as if elegance and grace had been taken away so as to enable them to endure the frosts and winds and storms of winter. Not so the Hemlock, with its slender, pliant stems, and dense, though airy foliage that bends to the wind like the branches of a Willow. It will be conceded that evergreens, taken as a class, are more valuable as winter than as summer trees. If our grounds in summer were filled with evergreens alone, the absence of deciduous trees would be seriously felt. Different as the kinds are one from another, it is impossible so to arrange them as to overcome the cold, rigid appearance of the class. If our grounds in summer were filled with deciduous trees only, the absence of evergreens would not be felt at all. But, besides being one of the best of evergreens to brighten the winter landscape, we should also select the Hemlock as adding a distinct beauty to the summer landscape as well.

That the Hemlock is not often seen about the farm house is due probably to the difficulty of transplanting it, or rather of having it live after it is transplanted. With regard to those taken from the woods, we have found that this difficulty is measurably lessened by treating them upon the same principle as, under the same circumstances, we would treat deciduous trees, viz: severely cutting them back. Not only is this true of the Hemlock, but of the Red Cedar (Juniperus Virginiana) and Norway Spruce. Thus far we can speak from experience, and what is true of the above genera is probably true of the family. Years ago people thought that evergreens must not be cut back at all. We, ourselves, once thought that a Norway Spruce or Balsam was worthless if its leader were destroyed. Now we know of no other way of preserving their beauty to old age than by cutting back the leaders while they are young, until the lower parts are so developed as to insure a bountiful supply of sap which, otherwise, in a few years, would tend to nourish the upper portions alone.

We spoke of experience. Five years ago, immediately after transplantation, we cut back six Arbor-vitæs five feet high to one foot in hight. All lived. A Norway Spruce and a Hemlock about six feet high were cut back to three feet. Both lived. Four years ago, we purchased about forty young Hemlocks from a nursery the soil of which was very sandy. They were about eighteen inches high. Most of them died. But of the survivors several had been cut back as soon as they showed signs of weakness. This fall we *pulled up* two young Red Cedars in the woods, wrapped paper about them, planted them in pots and cut off half of their branches and foliage, placed them in the cellar for three days and then in the conservatory where they are doing well.

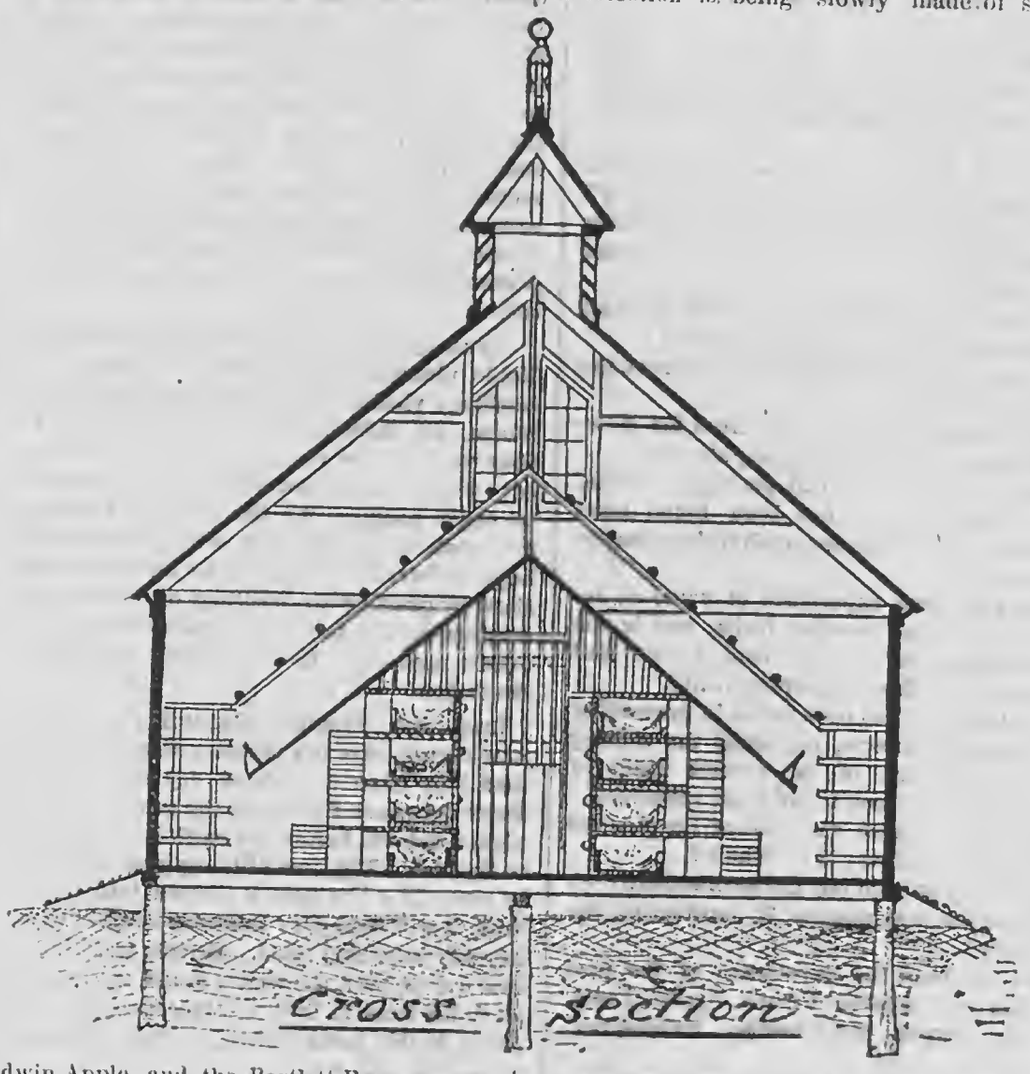
It is true there is no positive proof about all this. But the belief is strong upon the writer from such evidence and a good deal more of the same kind with which the reader need not be wearied, that all evergreens should be cut back when transplanted, more or less according to the injury which the roots sustain, the same as deciduous trees are cut back, though perhaps not to the same extent. The buds from the stems of deciduous trees push far more readily than those of evergreens and the vital processes of life are not so long suspended. Whence it follows that a portion of the old leaves must be left upon evergreens to perform the work which in deciduous trees might be performed by the new growth. Now, young Hemlocks, if taken from the woods without great care to preserve all the fibers by a "ball" of earth or otherwise, will die, no matter how carefully they may be transplanted. The questions we raise are: (1) would the mortality be as great if they were cut back? We have tried it in the case of the Red Cedar which we had supposed as difficult to transplant as the Hemlock. 2. Are not evergreens as a class benefited by being cut back in proportion (the proportion to be peculiar to them) to the injury sustained by the roots?

Pomological.

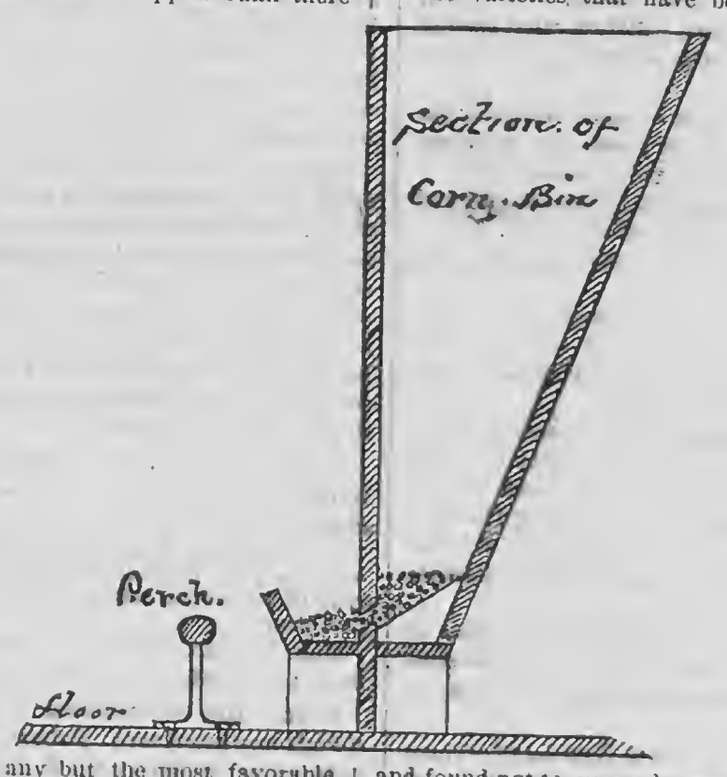
NOTES IN A NORTHERN ORCHARD—1.

T. H. HOSKINS, M. D.

These notes will specially interest those only who are trying to grow Apples in what is called, pomologically, the "cold belt," embracing the northern parts of Maine, New Hampshire, New York, Illinois, Iowa and Ontario, and all of Quebec and Minnesota, and of Wisconsin, except along the shore of the lake. They are the results of fourteen years' experience in Northern Vermont by one who, from a still longer experience in Southern Maine, supposed he knew what were hardy Apples, but who found, when he emoved to Vermont, that he knew very little on the subject. The Rostiezer, but not hopefully. Fifteen years ago it was believed that no Apples, except the Siberian Crabs, would endure the severity of the winters of northeastern Vermont, but now a selection is being slowly made of sorts,



Baldwin Apple, and the Bartlett Pear are considered tender in the Kennebec Valley. In the valley of Lake Memphremagog one might as well attempt to grow Oranges as either; while the Fameuse, Red Astrachan, Talman's Sweet, Blue Pearmain, St Lawrence, Sops of Wine and Westfield Seek-no-Further Apples rank there



as too tender for any but the most favorable localities, though set down as perfectly hardy in all the books. As for Pears, it is not known that, as yet, a Pear has ever ripened on the shore of Lake Memphremagog. Experiments are being made with the hardier kinds, Flemish Beauty, Clapp's Favorite, St. Ghislain and mostly new, that give every promise and considerable actual performance, in the way of success.

HARDY APPLES FOUND TOO TENDER IN VERMONT.

First let me clear the ground by giving a list of varieties that have been tested by us and found not to succeed, even under favorable conditions. This list will embrace only such as were recommended to be extra hardy. Of summer Apples, the American Summer Pearmain, William's Favorite and Summer Hagloe; of fall Apples, the Northern Sweet, Fall Orange, Colvert, Fall Pippin, Gravenstein, Franklin Sweet, Moses Wood, Fairbanks and Cathead. (the last four of Maine); of winter Apples, the Yellow Bellflower, Red Canada, Reinette, Munson Sweet, Danvers's Winter Sweet, Jewett's Fine Red, Minkler (of Illinois), McLellan (of Conn), Grime's Golden, Granite Beauty (of N. H), Bottle Greening, Northern Spy, Cooper's Market, Black Oxford, Morgan Sweet, Rockwood, Ramsdell's Sweet, Winter White, (the last five of Maine)

It will be noticed that the better keeper the fruit of an Apple is, the less likely it is to prove hardy in a severe climate. In fact, while a good many of the summer and early fall Apples of more temperate regions do fairly well in the cold belt, it may be said that not one of the standard winter Apples is hardy there. Those that most nearly approach hardiness are Blue Pearmain, Westfield Seek-no-Further, Talman's Sweet and Yellow Bellflower, in the order named. But not one of these is so hardy as to justify an orchardist in setting any number of them in his orchard with a view to profit.

APPLES FOUND HARDY ENOUGH IN VERMONT.

After testing, at a considerable expense, between 30 and 40 of the hardiest known sorts, it certainly was a discouraging prospect for one to think of raising an orchard. But a few gleams of comfort were discovered in the fact that some Canadian and Russian Apples proved to possess hardiness adequate, to the necessities of the case. Further experimentation gave some hardy varieties from the West and an active hunt for native seedlings revealed at least two hardy winter Apples possessing the requisite other qualities for use and profit.

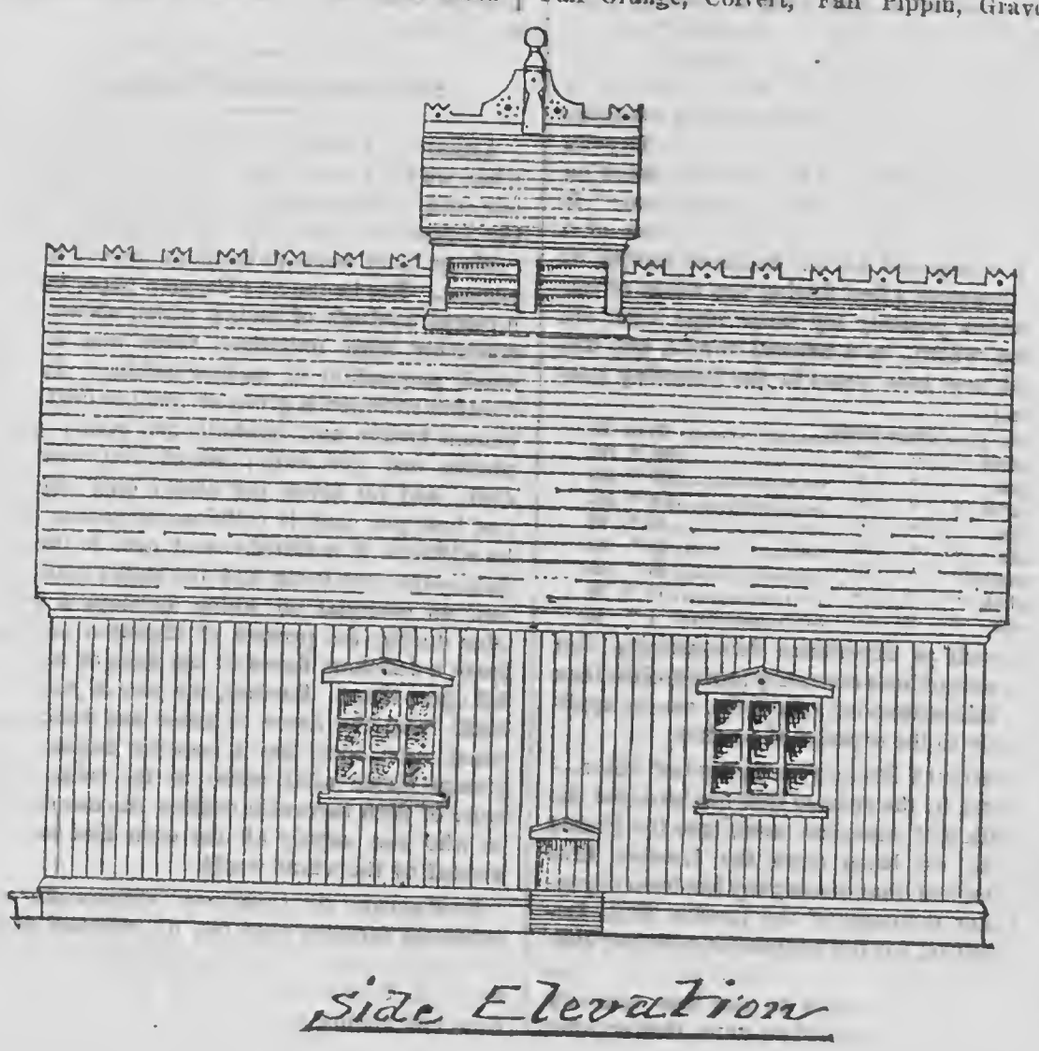
I will now give a list, covering all seasons from August round to July, of Apples of good quality, health and productive habit, that are quite hardy in my locality, near the village of Newport, Vt. at the head of Lake Memphremagog, six miles south of the parallel of 45 degrees, which constitutes the boundary between Vermont and Canada. The names succeed each other in the order of maturity, the earliest being named first.

Summer Apples.—Yellow Transparent, Grand Sultan, St. Peter's, Tetofsky, Summer Harvey.

Fall Apples.—Duchess of Oldenburg, Peach of Montreal, Pringle's Sweet, Prolific Sweet, Aroostook Harvest, Emperor Alexander, Plumb's Cider.

Winter Apples.—Wealthy, Northfield Beauty, Tracy Apple, Meader's Winter, Magog Red Streak, Scott's Winter, Case's Winter Sweet.

In another article I will give a short description of each of these Apples; and in a third, complete these notes by some remarks upon other varieties not strictly hardy, but possessing merits which, with moderate hardiness, entitle them to trial as top-grafted trees, or in sheltered places, even in the "cold belt." To this I will add brief minutes regarding new sorts believed to be hardy and meritorious, but not yet sufficiently tested.



Field Crops.

PROFITABLE CORN AND WHEAT RAISING.

For the benefit of my brother farmers who read the Rural, I desire to add to the testimony of Messrs Van and D. Steek—noticed in the Rural of December 7—a few items of interest in reference to the successful cultivation of these two cereals.

For some years I have been cultivating corn and wheat with a view, all the while, of making the most and best seed from a given extent of land, at the least cost, in the shortest possible time and with the least permanent injury to the soil. Discarding all old-fogy ideas, I persistently pursued their culture on almost purely scientific principles. In the first place, the natural laws that govern vegetation were complied with, the habits of the plants, their demands and wants were carefully attended to. In the second place, the nature of the soil, its elements and adaptation to the growth of the plants; were analyzed, and where deficiencies occurred, elements were supplied, and where too much stalk food predominated, materials were applied to neutralize the excess and secure the proper proportion of the various elements of the plant food.

For instance, low, alluvial land always produces too much stalk and too little grain. To make less stalk and more grain, lime, salt, ashes, etc., may be used to great advantage and profit. In the vegetable, as well as in the animal world, there are good, bad and indifferent specimens. Stockmen have them all, and it is only by close breeding, careful study and intelligent application of Nature's own laws, that they finally succeed in producing pure and valuable breeds. Just as much attention should be given to the selecting and saving of seed corn and wheat. The largest and best-looking ears taken from the crib do not by any means make the best seed. The best seed corn is always found in the field on the top ears of those stalks that bear more ears than one and ripen earliest. Seed corn should al-

ways be selected in the field, not from the largest stalks but from those that are the best-formed and have the finest stover.

Seven years of experimenting, working on one variety, have given me one that is almost invaluable in almost every respect. It is very prolific, having on each stalk several ears, each yielding from five to eight ounces of grain. My best specimen of a stalk had fourteen ears and shelled sixty-three ounces. My best 100 stalks selected from off an acre, shelled 170 pounds, and my best acre on highly improved land made me 102 bushels shelled. I merely state these facts to show what can be done by way of improvement in our cereals.

A word about the physiology of the plant may not be out of place right here: It is the largest of the grasses. It is monœcious and susceptible, perhaps, of greater improvement than any other. My opinion is that, in its original and primitive state, every joint that has a groove bore an ear. One may see on examination an ear or an embryo ear on every node from the roots to within six or seven of the tassel. Then I ask, why do not all develop as does that on the last joint generally about two-thirds of the way up? [Our answer would be, because it doesn't.—EDS.] I find an ear can be made by careful selecting and saving the seed, feeding and proper culture.

Wheat, too, can be wonderfully improved by picking by hand the center heads of the largest tillers, that ripen earliest. This insures pure seed, reliable and free from every foreign variety as well as from all cheat, cockles, etc. I do not mean that a farmer should pick all his seed, but I do say that he should pick a bushel or two which, when sowed on a choice, clean acre or two, will produce his seed for the next season. This picking should be done every year, so that the wheat may not deteriorate.

The most reliable preventive for the rust and perhaps one of the best top-dressings, is a mixture of salt and ashes—half and half. By mixing in December, or early in January, and keeping it stirred twice a month, it becomes in two months one of the best of fertilizers. Put it on in February or early in March. Four to ten bushels to the acre will pay any one twice the amount of expense and labor expended.

A. E. BLUNT.

Monroe Co., East Tennessee.

THE BEST POTATO?

FOR the past few years the Peach-blow, which was formerly the standard potato, has fallen into disrepute with farmers generally. All agree that, when perfect, it is a noble variety; but we cannot afford to raise it. A good crop is the exception. My own yield from half an acre this year, was twelve bushels of merchantable potatoes. (My Early Rose in parallel rows gave me at the rate of 100 bushels per acre). Last year the crop was better; but not large enough to make up the deficiency.

The Early Rose, which succeeded the Peach-blow in popularity, has done well for me *always;* but I hear complaints from many of my neighbors, who say it is running out with them and they want something more reliable. I am inclined to think that in the majority of cases this gradual failure is due to poor seed and insufficient cultivation—by which I mean lack of manures as well as lack of stirring the soil, in some cases aggravated by putting the same crop on the field year after year.

To those who may be seeking something better, I would recommend a trial of the Snowflake and the Carpenter's Seedling, both of which have done exceedingly well with me—soil, a very heavy clay, made rich with good stable manure and tillage. The Snowflake is perhaps too well known to need a description here. It is the *best* potato for the table I have ever seen; and my experience is, that if you will make the land rich enough, there will be but little trouble of small potatoes in the hill. With me it is a good yielder, and keeps well enough.

The Carpenter's Seedling is a large, white potato, oblong in shape, a handsome potato, and one that finds a ready market. It is a good producer; about the same season as the Snowflake; quality, fair. There are very few small potatoes in the hills, and the tubers are generally of even size. It is a good keeper. I have tried several of the new sorts—the Alpha, Ohio Beauty, Early Ohio, Ruby, Brownell's Beauty and several others—but for home use, I prefer the Snowflake to any of the others. For market, the Snowflake, Carpenter's Seedling and Early Rose are my choice. Who can name a better list? [We should add Beauty of Hebron.—EDS.]

H. T. J.

ALL of us know full well that manure is a valuable commodity. But when it is looked upon as representing so many dollars and cents, no doubt we shall take pains to make more manure and to be more saving of what we have. There are many farmers who would dig a pretty big hole if sooner or later they were sure to find a five-dollar gold piece in it, yet these men for the same amount of labor could accumulate more than five dollars' worth of manure that would insure an extra yield of perhaps ten dollars' worth of crops.

Miscellaneous.

WHAT OTHERS SAY.

THE following prolific questions for discussion are announced for the meeting of the New York Horticultural Society, to be held in Rochester the 22d inst.:—

Are we in danger of an over-production of fruit, and how can we secure a steady supply?

Can we expect a large foreign demand for fresh and dried fruit, and how can we increase the demand?

To what extent can the production of fruit of an extra quality be profitably carried?

How can we most economically, improve the quality of apples?

What variety of apple, aside from the Newtown Pippin, is best for shipping abroad?

What description of fruit packages, boxes, baskets, barrels, &c., has been found most satisfactory, especially for small fruits, peaches and grapes?

Is there any new experience of value in regard to drying and canning fruits, and in the construction of refrigerator fruit houses and cars, or new method of keeping fruit?

What progress has been made in preventing the ravages of insects, especially the codling moth, and which of the several kinds of traps in use have been found most effective?

Are any of the new varieties of Raspberries profitable for market; if so, which?

Should any now on our list be discarded?

What is the best method of cultivating the Raspberry?

What has been the experience of the past year with new varieties of fruits, Apples, Pears, Peaches, Grapes, Strawberries, Raspberries, Gooseberries, etc.?

What new varieties of Potatoes, Tomatoes, Pears, Beans, Squash, Melon, Celery, etc., are worthy of commendation?

Which of the recently introduced species and varieties of new ornamental trees, shrubs and plants, give promise of excellence?

Is it likely to prove profitable, in W. N. York, to plant trees for timber, and if so, what species and varieties, deciduous and evergreen, can be recommended?

What new implements of value are there, for orchard and garden purposes, viz: pruning, cultivating the soil, destroying insects, etc.?

New Books, Periodicals, Transactions, and other sources of pomological and horticultural information—what should the Society do in reference to them?

What is the latest experience with hedge plants? Is the Honey Locust suitable for a hedge plant? What is the best of all hedge plants for Western New York?

Which can be employed most economically and effectively for the embellishment of small gardens—Annuals, Hardy Herbaceous Perennials or what are known as "Bedding Plants?"

Can any principles be laid down for the arrangement of flowers and foliage in baskets and bouquets?

The adaptation of the different varieties of Apples, Pears and other fruits to different soils and exposures—what experience is there on this subject?

HOW MANY EGGS CAN A HEN LAY?—There has been so much loose talk about the total number of eggs a hen is capable of laying and her yearly yield under fairly good treatment, that it is a satisfaction to come across something beyond guesswork or mere inference on the matter. The foundation of science is accurate observation, and when a scientist publishes a statement, it is presumable that it is based on this foundation. Its accuracy, too, is confirmed, if it is quoted with approval by other men of wide experience and knowledge on the subject involved in it. Now, Geyelin says, and Prof. Miles in his excellent work on stock breeding, quotes him with approval: "It has been ascertained that the ovarium of a fowl is composed of six hundred ovules or eggs; therefore a hen during the whole of her life cannot possibly lay more eggs than six hundred which, in a natural course, are distributed over nine years in the following proportion:

First year after birth	.....	15 to	20
Second " " "	.....	100 "	120
Third " " "	.....	120 "	135
Fourth " " "	.....	100 "	115
Fifth " " "	.....	60 "	80
Sixth " " "	.....	50 "	60
Seventh " " "	.....	35 "	40
Eighth " " "	.....	15 "	20
Ninth " " "	.....	1 "	10

Inasmuch as experience demonstrates that some breeds of hens are vastly more prolific than others, this statement, of course, can be applicable only to the average of poultry.

A EUROPEAN RIVAL FOR AMERICAN MEAT.—Stimulated by the success that has attended the importation of American meat into the United Kingdom, we learn from the London Live Stock Journal, that a company has been organized under the name of the London Meat Importation Co,, for the purpose of securing supplies from districts near home if possible. The report of the directors to the first ordinary meeting of the shareholders states that an offer has been made to the company to load a vessel throughout the year with prime first-class meat, either on account of the shipper, on joint account, or on account of the company. The directors have made a personal inspection of various districts in North Germany, Austria, Hungary, Transylvania, Bohemia, Galicia, and in other portions of Eastern Europe, in order to decide as to the quality of meat suitable for the British market, to provide the necessary slaughter-house, appoint agents, etc. The directors report that they find it best, for many reasons, to slaughter as near the source of production as possible. The meat will be transported by refrigerated railroad cars and steamers.

JAPAN QUINCE SEEDLING.—Our friend Gen. Noble planted a "mixed lot" of seeds. The seedlings yielded six or seven different tints of bloom, all different from the parent. "*But* they took *thirteen* years to show the first flower! Such a tardy reward to trial, disheartens us eager people. We tire of patient waiting, and seek novelty in that which absorbs less hope deferred." He tried to hurry up their show by grafting his seedlings on the common Angiers Quince, but they would not mate. The article appears in the Gardener's Monthly for December.

LIME FOR BORERS.—Regarding borers in peach trees, says the Country Gentleman, it is useful to heap a peck of dry slacked lime about the peach trees after the grubs have been picked out and before the earth is drawn back to the tree. The lime kills any grubs that may be left. If a live grub is thrown into the dry lime, it will soon die; this may be tried to satisfy any inquiring mind. Having used lime in this way in 1877, the writer found no borers at all in his trees in 1878, and therefore has confidence in this means of repressing the depredations of this pest.

JELLY FROM THE JAPAN QUINCE.—J. W. Kerr says, in the Germantown Telegraph, that jelly made from this fruit is almost without a peer. But the bushes fruit very sparingly and it takes a good deal of fruit to make a little jelly. Wherefore, considering that this fruit is well-nigh as hard as a rock, its excellence is not likely to become generally known. Speaking of this beautiful shrub, why is it that it is only the blossoms near the ground that ever set fruit at all?

ENGLAND'S NEED OF FOREIGN FOOD.—Mr. Caird, the celebrated British agricultural statistician, says that quite one-half of each loaf consumed in England is of foreign origin, that one-fourth part of their whole meat and dairy produce comes to them from across the sea, and that almost the entire additions which may hereafter be sought to fill the ever-multiplying mouths of their dense population, must be drawn from other lands.

A WONDERFUL PLUM TREE.—We take the following from one of our best Western exchanges, word for word:

"We knew of three large plum trees in the western part of Detroit which bore a good crop of corn cobs saturated with kerosene the past year."

Here is a sort of plum tree that commends itself to the Bridgets of our country.

PORK.—The Germantown Telegraph says: "Pork unwholesome! Nobody except a lean, cadaverous, sedentary biped, who is obliged to live, probably on account of early dissipation, on Graham bread, and weak tea, would be guilty of such a slander!"

THE BEST PEAR.—Major Freas says, if he were to be asked to name the best Pear for general cultivation, he would unhesitatingly say the Lawrence.

NOTES OF CURRENT EVENTS.

AMERICAN CORN.—It is fortunate for us now when we are looking for enlarged markets for our corn, that Europeans are becoming favorably impressed with its valuable properties. "We go from home to learn the news" in this respect. For instance, a German paper notices a recent analysis of maize, which shows a remarkably high nutritious value and a very small proportion of useless residue. In this analysis nitrogen is given at two per cent.; albumen twelve and one-half per cent.; phosphates one per cent.; starch sixty-two per cent., and fat seven per cent.; only one and one half per cent. is cellulose or woody fiber. In addition, it is stated—and here is the new point—that the grain and the stalks both contain an essential oil which develops a sweet odor during the process of digestion and imparts a delicious flavor to the flesh of animals fed upon them. Further, the *pate de fois gras* made from the livers of geese and ducks fattened upon corn, has a peculiar delicate fragrance which adds much to its value. The more of such favorable notices, the merrier for us who can supply all the corn that may be wanted by the whole world.

EXHIBITION OF CORN.—A wide-awake and energetic farmers' club can do wonders in developing the interests of any locality. The Elmira (N. Y.) Farmers' Club is such an association, and during the years of its existence, has not only done much to forward the interests of agriculture in its own neighborhood, but has been a shining light in many distant dark places. A recent suggestion comes from this club. It is to hold an exhibition of corn, giving premiums for the best six ears shown. This is a worthy idea and will undoubtedly assist more to increase the yield of corn in western New York than any other device or method hitherto made known. Corn shows could very profitably be held in every village and township in the country.

A CONVENTION OF TILE MAKERS.—Those worthy and useful people, the drain-tile makers of Indiana, have had a convention. The extension of the business of draining may be imagined when we state that no less than 500 tile factories are kept busy in that State alone. The whole of these turn out in the working season of six months about 250,000 tiles each, or 125 million tiles in all. The benefit accruing from the use of so much tile every year must be enormous, and the tile makers in their effort to advance their own interests—which we take to be the object of the convention—can hardly fail to help the public interest as well, if they do nothing more than educate the farmers up to the point of knowing that to drain their wet lands will add greatly to the productive capacity of their farms and to the general wealth.

NEW FACILITIES FOR MEAT TRADE WITH EUROPE.—A contract has just been made by W. H. Vanderbilt for the establishment of a new line of steamers to ply between this city and various European ports, in connection with the different railroads under his control, and especially with the New York Central and its tributaries. They will be large, slow boats, designed mainly for freight. It is the present intention to fit up each of them with compartments adapted in the best way for the transportation of live stock and dressed meat to Europe, and it is expected that our trans-atlantic trade in stock of all kinds will receive a vigorous impetus from the facilities in this way afforded to its prosecution.

THE "Perfect Milk-pail" announced in our advertising columns this week, is the one that attracted so much attention at the International Dairy Fair. It is a very complete contrivance that one hates to part with, having used it once.

Horticultural.

SEED "RUNNING OUT."

There is much said about seed degenerating, or, as it is commonly termed, "running out," when grown and planted, or sown for a succession of years on the same soil, or in the same locality. This *may* be true in some instances, but I do not think so. Seed grown on rich, strong soil will do better on poor soil the first season than seed raised on that same soil. On the other hand, seed grown on poor soil will not do as well on rich soil the first season as seed grown on the same, but it will give a larger yield than if planted on its own soil. In other words, it is the richness of the soil and not the quality of the seed which increases the yield. I have grown, for the past ten years, one variety of potatoes (the Albany seedlings) without exchanging seed, on the same farm, and they were never better than the past season, although this has been a poor potato year. Early Rose planted near them, did not yield more than one-fourth as many bushels to the acre. And Snowflake, the seed of which I obtained last season, did not yield a heavier crop. By the way, I consider the last-named an excellent variety.

"ANON."

Ithaca, N. Y.

STRAWBERRIES.—Mr. Charles Shinn writes us from Alameda Co., Cal.: With us, near the Bay of San Francisco, the Peabody's Seedling is still the variety used for a main crop. Wilson's has never been a favorite. Longworth's Prolific is also planted, and, on some heavy soils, Jucunda and Triomphe de Gand, all productive and good market berries. Nothing else which our strawberry men tried was received with much favor until recently. The Monarch of the West was a magnificent market berry this last season, and will be planted largely in future.

I do not yet feel warranted in reporting upon any others of the new berries. Our system of cultivation is on ridges, with abundant irrigation between the rows, and we get enormous crops from the varieties best adapted to that system. Our Monarch of the West planted for family use, gave a fourth crop in one year, and the only enemy is a white grub in the collar of the plant. It is avoided by irrigation.

ALFALFA—A correspondent referring to an inquiry in a late issue of the RURAL, about the best way to kill Alfalfa, agrees with us that it is very tenacious of life, and says that having once obtained a good root-hold, it will last for fifty years, in his opinion. From 20 to 25 pounds of seed per acre are needed for meadow

to secure fine hay. If sown thin it grows too large with stalks too woody. Last summer he cut five tons of good hay per acre from Alfalfa. All kinds of stock are fond of it. He mowed it three times. It will produce one crop of seed and one of hay or three of hay; or it will pasture twenty sheep per acre through the summer. Three light plowings in August will kill it; or too much irrigation will have the same effect. For the last three seasons he has plowed some every spring, and it thrives well under the treatment, though he sowed spring wheat upon the ground.

It would be rash indeed to say that the Acme Tomato is destined to take the place of the Trophy. "We can hardly see how it could go ahead of the Trophy properly grown," says the agricultural editor of the Weekly Tribune. If plants of each be grown side by side, these differences might, we think, be noted: The Acme is earlier, of a rounder form, of a more uniform size and ripens perfectly about the stem. The color is a purplish red. It is of medium size and is easier to dress. The Trophy is larger, more lobed; of variable size, and does not generally ripen about the stem. It is a heavier cropper and the color is a bright red.

The Horseman.

CLYDESDALE HORSES.—Acting under the authority of the Clydesdale Horse Society of Great Britain and Ireland, the Earl of Dunmore has compiled the first and retrospective volume of the stud-book of that breed. In it he rejects the popular theory that the Clydesdale breed is the result of a cross between the native Scotch mares and some Flemish stallions imported by the Duke of Hamilton more than two centuries ago. He favors the opinion that the breed is a mixed one, the reward of careful attention in the selecting and mating of the best animals by the farmers in the valley of the Clyde. The work contains a short history of the Clydesdales; pedigrees of 1,044 horses foaled previous to Jan 1. 1875, and an appendix containing particulars of stallions which could not be classed as Clydesdales but which are alluded to in the numbered pedigrees. The data on which the history has been founded, have been corrected and substantiated by personal investigation in Lanarkshire, the birth-place of the breed. Recently a lot of 15 Clydesdale female horses of various ages, were sold by one man at Glasgow Scotland at the high average of $630, cash. The highest price paid was $1,250; while a famous prize-taking four-year-old mare was reserved at $2,500. There it seems good horses are thoroughly appreciated in the home market.

REMEDY FOR COLIC IN A COLT.—The colt has been grazing on the winter oats for the past ten days, apparently doing finely, but last night she came home suffering from colic. We drenched her with half a coffee-cupful of soda in a pint of water, which gave relief in twenty minutes. This is not the first time we have used this remedy, always successfully. We were surprised that the colt should have colic after becoming accustomed to the green food. Our colored man says, "the hard freezing of the last few nights made the green oats 'colicy." Perhaps he has about the right idea with regard to the matter. To be safe, we shall let the cows and pigs enjoy the oats during the remainder of the winter. M. B. P.

The Herdsman.

THE BEST SHORT-HORN HEIFER IN THE WORLD.

THE opinions of judges may, and doubtless always will differ as to which is really the best of two animals of nearly equal merit; but if we are to judge by prizes won at the most famous cattle show in the world, then the dignity of being the best living animal of her kind, belongs to the superb Short-horn heifer ICICLE, of which we present two views, which are, no doubt, excellent portraits, as they show throughout remarkable skill, both in the photographer who took the pictures and in the artist who copied them, retaining the accuracy of the photograph, but giving to it the ease, grace and reality of pictures from life. It seems strange that up to this time we should not have, on this side of the Atlantic, some animal draughtsman whose work will approximate, if not equal this.

We take these pictures from the Agricultural Gazette of London, in which they accompany the report of the recent cattle show of the SMITHFIELD CLUB, now held annually a short time before Christmas, at Islington, a suburb of London. Only fat cattle, sheep and pigs are exhibited, and the show of this year is the 81st of the Club.

The heifer ICICLE won the Champion Cup last year, and this year she wins the £40 Cup ($200), as the best beast in the Short-horn classes, the £50 Cup ($250), as the best heifer or cow in any of the classes (except 32), and a piece of Plate valued at £100 ($500), as the best beast in the Show. These prizes are given by the Smithfield Club, and besides she wins the Agricultural Hall Company's prize of 100 guineas ($525); and, as if this were not enough, our contemporary adds, "We understand that the enterprising firm of Cake (Linseed Oil) manufacturers, Messrs. J. Gibbs & Co., are also permitted to add their 100-guinea decoration"—($525) more. This makes altogether 400 pounds

"ICICLE"—FRONT VIEW.

sterling, or $2,000 won by this one animal at this Show—truly a wonderful record. This is the famous heifer referred to below in the letter of Professor I. P. Sheldon.

THE SMITHFIELD SHOW.

I. P. SHELDON, ROYAL AGRICULTURAL COLLEGE, CIRENCESTER, ENGLAND.

I may, I think, venture to presume that to most if not all the RURAL agricultural readers, the term Smithfield Show needs not to be interpreted. Nor will this assumption on my part be ascribed to national vanity, for, really, apart from all that sort of thing, the Smithfield Show has a reputation which extends over the greater part of the world. The Show is older than the present century, and it manifests all the vigor and freshness of perennial youth rather than the decrepitude of old age.

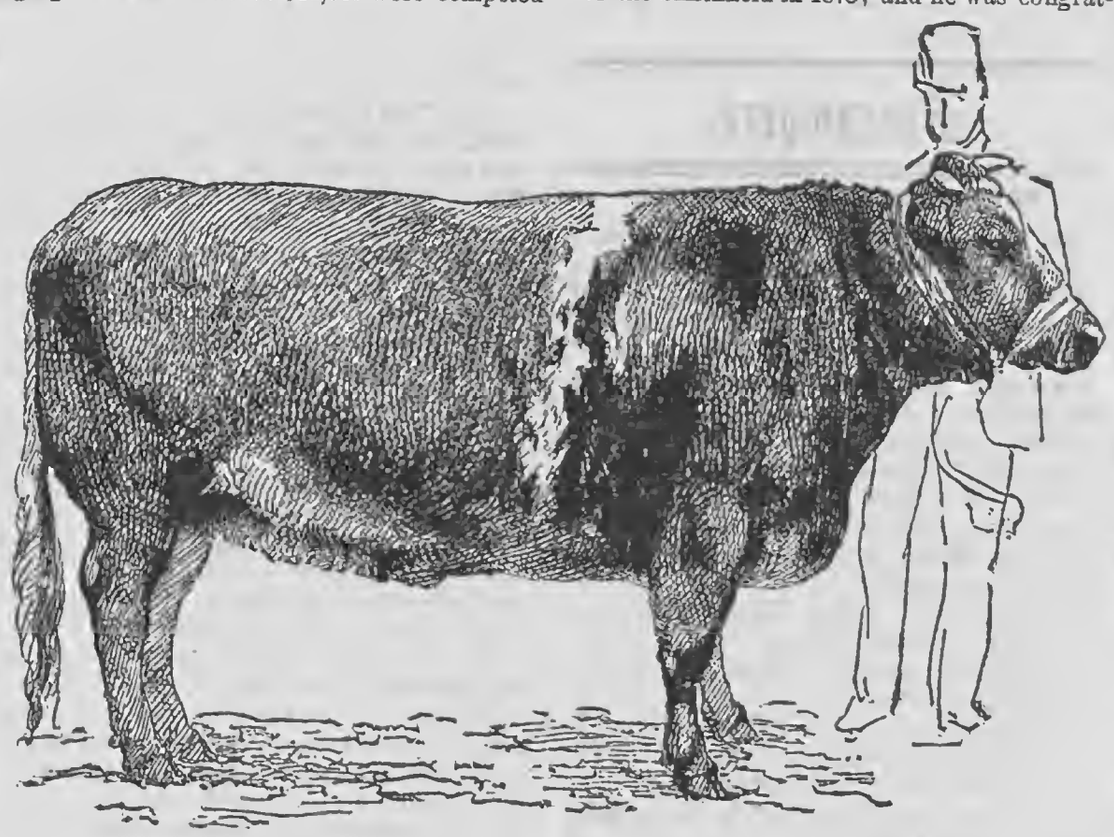
The Smithfield Club is a society unique in character, and peculiar to England. Its career has been one of honor and usefulness, and its age lends a lustre to its doings. Only one of our prominent agricultural associations is older than the Smithfield, and that one is the Bath and West of England Society, which held its centennary last year.

The Smithfield Club held its eighty-first annual Show of fat stock, in the Agricultural Hall, London, last week, and prizes of the aggregate value of about $14,000 were competed for. It must be remembered that these prizes are offered, and this Show exists for fat stock only, and that *breed*, as such, is of no account whatever. There are, of course, classes for the different breeds of cattle, sheep, and pigs; but in these, excellence of breed, purity of type, or any of the other characteristics for which each breed is respectively famous, is of no account. The animals are, of course, required to be pure-bred in their classes, but the prizes are awarded on account of perfection in fattening, and this is determined by quality rather than by quantity of flesh.

I do not say that it is theoretically impossible for such a Show, containing animals of equal merit, to be held in any other country, but it is practically impossible—at all events in the present day, and in any other country than America. There are in no countries except yours and ours, an equal number of animals, having equal merit as fat animals, such as we find at the Smithfield Show; and even if there were, it would be found practically impossible to get together such an exhibition. We could not get together such an one in England, and we should never feed the animals up to such an extreme degree of fatness, were it not for the honor which centers in the winning of prizes there, and for the substantial inducements which the Smithfield Club offers. The Club is wealthy, and the Show is popular, and so the prizes can be offered year after year.

The "Blue Riband" of the Smithfield Show is a coveted distinction, and our leading farmers are at great pains to win it. See what it amounts to in money: the champion beast in the Show is necessarily the best in his or her class and of his or her breed, as well as being the best among all the breeds. Now the champion prize is a piece of plate, value, 100 guineas; the prize for the best animal of the breed is a cup, value £40; and the prize for the best in the class is £20 in cash. So it follows that the champion beast secures to her owner three separate prizes, whose aggregate value is £165, or $825. This in itself is no mean triumph, as it is no barren one. But the honor of producing the most nearly perfect fat beast in the Show is almost more highly valued than the money—is more highly valued in fact.

Mr. Stratton, of Newport, Monmouthshire, is the enviable winner of the "Blue Riband" of the Smithfield in 1878; and he was congratulated first of all by the Prince of Wales, who witnessed the judging for the champion prize. The animal whose transcendent merits secured to her owner this coveted distinction, was a superbly beautiful red-roan Short-horn heifer. She is not very big either in stature or in actual weight; but she is one of the most nearly perfect fat animals I have ever seen. She is a *multum in parvo*; her top is wonderfully broad and long; she is very short on the leg, marvelously wide and deep in the breast, and very deep and spacious in the hind-quarters; her bone is fine and small, and the proportion of offal is very small compared with that of meat. She is splendidly fed, and handles firm and full of quality; wherever possible the meat and fat are put on, not in lumps, but in a shapely, uniform covering; and she exhibits two elements in perfection—those of breeding and feeding.



"ICICLE."

In the past forty-eight years the champion prize has been won by Short-horns twenty-nine times; by Herefords, nine; by Devons, seven; and by Scotch cattle, three. This fact speaks volumes in favor of the capacity of the Short-horns for being fattened to the highest possible pitch of perfection. But is all this extreme obesity in cattle a desirable thing in itself? We say, no; but it is an old custom to get them up for the Smithfield, and it is one of the things in which our leading agriculturists take a pleasure—a pleasure which is very expensive, and which seldom repays the cost.

STOCK NOTES.

FASHION IN STOCK.—The English papers contain reports of recent sales of sheep. Among these the prices obtained for Shropshires are particularly noticeable. This sheep is just now the fashion, and breeders are bidding prices up well into the three figures. Ewes sold for 120, 90, 185 and 105 dollars respectively, and rams brought from $105 up to $600. This fashion in stock hurts more than it helps. It misleads and brings disaster to hundreds of that class of people from whom—we are told—their money is so easily parted. It has been so with the Short-horn and the Jersey among cattle, and now the Guernsey is the rising cow. By and by it may, perhaps, become good and solid advice to tell farmers to keep stock breeders at a distance, lest their money should too easily slip out of their own pockets into those of that smart class of people. No farmer can now afford to pay $200 or half of it for a sheep or a pig, or $500 for a cow or a bull.

THE TEXAN FEVER.—Disease is reported to be very prevalent amongst cattle in Texas. The peculiar form is that of carbuncular erysipelas, or what is known as black-leg, murrain, or black-quarter. As the Texan stock becomes mixed with the improved races, the latter and the progeny of the mixture as a matter of course may be expected to become victims to the prevalent diseases from which the semi-wild race escapes. This seems to be the case, and the more valuable cattle are suffering just now more than usual. A sad result of the disease is the death by blood poisoning of many persons who have been engaged in skinning the carcasses of cattle that have died of the disease. This is a fearful fate, as a most painful death is inevitable from the least inoculation of the poison from the carcass, death being preceded by the occurrence of boils, carbuncles and ulcers over the whole body. It is safe to bury the whole carcass and not risk danger for the sake of a hide.

SOME PORK.—The whole number of hogs packed during the season of 1877-8 amounted to 9,905,000. The aggregate quantity of pork and pork products for the year is about 1,800,000,000 pounds, of which more than half was exported to foreign countries. With such an enormous production, prices have, of course, been greatly reduced; but, on the whole, the amount of money which has found its way into farmers' pockets from this business is over $50,000,000. As compared with the prices of other things, these fifty millions represent as much value as the larger amounts in other years when prices were higher. It is not the money itself, but what the money can effect in exchanges, which fixes the value and profit from it, and on this basis there is not much to complain of in the last season's pork business.

CATS.—These useful animals are worthy of notice from professional breeders, and we gratuitously give the latter the hint. Dogs have had their day as vermin killers, and now chiefly furnish subjects upon which farmers can vent their surplus spleen and animosity; or material for soap boilers and glove makers in the populous cities. The curly dogs whose skins used to furnish overcoat collars and cuffs, have disappeared, and the hunting dog has usurped the first position at the head of the canine race. As useful dogs exist no longer, we might turn to cats in place of them. These animals, if given a chance, would soon annihilate mice and rats, and beside this use they furnish a valuable fur. This is the point to which the stock breeders' attention is drawn. They might go further and fare worse. Jet black and fancy marks in cat skins are becoming fashionable, and now that the black points of the Jerseys and the mealy noses of other cattle are fixed permanently, the harmless, necessary cat might be put in training for solid colors, or such marks and points as may be desirable. The business of breeding cats is already established in European countries, and we might very well take a hand in it.

ABORTION IN COWS.—Herr Mobius expresses the opinion that this is often caused by giving the animals too cold water to drink.

Sheep Husbandry.

SHEEP ON NEARLY EVERY FARM.

Sheep raising in St. Lawrence county, N. Y., although not carried on extensively by any one, is yet a very important item of the wealth of the county. When nearly every farmer in a community keeps sufficient sheep to enable him to supply not only his own wants, but also to sell lambs, mutton and wool, sheep-breeding in the aggregate is of considerable importance, and this may be said to be the condition of wool-growing and sheep-breeding in this section. The farmer who does not keep a small flock of sheep is very rarely to be met with. The flocks in size range all the way from a half-a-dozen up to seventy-five and one hundred. The larger flocks are kept by men who do not keep cows or are so situated as to consider it more convenient or profitable to raise lambs and wool. There are very few prominent breeders of thoroughbred sheep, but we have a few farmers who have done a great deal for the improvement of sheep by the introduction of thoroughbred Leicesters and Cotswolds. The prevailing sorts are natives, or rather mongrels improved by the use of Cotswold and Leicester rams. There are a few small flocks of fine-wool sheep; but they are not regarded as profitable.

The greatest source of profit from sheep keeping lies in the sale of early lambs. The butchers usually pay from $3 50 to $4 00 per head for good animals of this sort. But the lambs that command the highest price are dropped by large, vigorous ewes, bred to Cotswold bucks. The lambs should come early and the ewes should be well housed and fed, and every possible precaution should be taken, especially in cold weather, to prevent accidents and keep the lambs growing. Late lambs are gathered up by drovers and shipped to the large cities. They do not usually command more than $2 50 or $3 per head. Even taking into consideration the extra care and cost of raising them, the early lambs pay somewhat the best.

In addition to that from lambs, a large share of the profit of sheep keeping comes from the sales of wool. The ordinary sheep clip, on an average, six to eight pounds per head. And herein is the ground for the prejudice against fine-wool sheep: their wool may be nicer for home use; but inasmuch as their clip is not as great as that of the others and does not command as good a price as the combing wools, there is no good reason why they should be kept. There is one reason for keeping sheep which is not very often taken into account, and that is, the keeping of them on rough land for the purpose of killing the weeds and brambles. They can be kept profitably on land too rough to be valuable for pasturing cows and horses. F. K. Moreland.

St. Lawrence Co., N. Y.

Various.

TRAMPS, AND HOW THEY ARE MADE.

Fifty years ago there were no tramps, but there were plenty of apprentices. Then everybody could learn a trade. Now boys are shut out from all trades by the arbitrary laws of the trade unions. Manufacturers dare not employ any boys, and the beneficent, time-honored apprentice system is entirely abolished. Boys without trades grow up without education, and become idle members of society, living upon their relatives while times are good, and when they cannot keep them longer, the youngsters are turned loose upon society perfect outlaws. If the apprentice system can be again introduced, which means the destruction or modification of trade unions, we shall soon see a wholesome change. Tramps are the natural result of an excess of foreign mechanics; let us encourage home manufactures by home manufacturers. S. R. M.

BEE HINTS.

At present there is but little to be done in the apiary, provided the hints for wintering bees, given in a full number of the Rural, have been followed. The hives must, of course, all be protected against the cold, and in the Southern States, against the heavy rainfall. Be sure that the mice do not gain admission to the colonies, and take care, also, that the temperature in the room where the bees are stored, is kept as near as possible between 35 and 45 degrees F. Should the temperature rise higher, and the bees become uneasy, select a warm, sunshiny day, on which to remove them to the open air, so that they may discharge their fæces, and while they are out, clean off the bottom boards as carefully as possible. If they are in danger of starvation, they must be fed with good capped honey.

Millers and Wire Binders.—The millers of Minnesota seem determined to make an exterminating war on wire binders. At their late convention a resolution was adopted to make a discrimination of 10c. per bushel against wheat which had been bound in this way. They insist that their stones and bolting cloths are seriously injured by pieces of wire which careless workmen permit to pass through the thrashers. The millers of Illinois also strongly object to these binders: but make no discrimination against the wheat on which they have been used. It is to be hoped for the benefit of all, that some less objectionable form of binders of equal efficiency may soon be devised; but meanwhile it is more than doubtful whether the millers of Minnesota are powerful enough to fix the price of wheat even for their own State.

CATALOGUES, &c., RECEIVED.

Price-list of choice field and garden seeds, W. B. Jones, Herndon, Ga. The catalogue particularizes Field Crops, Cotton and Forage Plants. Among the last named Mr. Jones says; "Egyptian, Cattail, East India, or Pearl Millet, is the best green soiling plant known in the South, from which three or four cuttings can be obtained on good soils. Am now (15th October) making my fourth cutting. These seeds were sold in Northern and Western States, last year, at most fabulous prices, where they cannot be matured, showing how much this plant is appreciated there for soiling and hay purposes. Two pounds of seed will plant an acre."

Sugar Frauds and the Tariff. This is a pamphlet of 30 pages by H. A. Brown, ex-special Treasury Agent. It treats of various frauds perpetrated on the revenue by importers and refiners of sugar, and the relation of these frauds to the home production, consumption and general interests. In noticing the brochure on the same subject lately published by D. A. Wells, we remarked last week that there seems to be ample grounds for a revision of our revenue laws in that connection, and this work strongly confirms that conclusion.

The Young Scientist. This is a twelve-page, well-illustrated monthly periodical, edited by the well-known John Phin, published by the Industrial Publication Co., 176 Broadway, New York, and costing only 50 cents per annum. The articles treat chiefly of scientific and semi-scientific matters, are written in a clear, intelligible style, frequently refer to practical subjects, and are interesting and instructive not only to youthful students, but often also to older heads in which there is still room for a good deal of useful information.

Western New York Hort. Society. Twenty-fourth Annual Meeting to be held in the city of Rochester, in the new City Hall, commencing on Wednesday, January 22d and continuing two or three days. The members of the Western New York Agricultural Society, and Farmers' Club, and all who take an interest in fruit culture and horticulture, are cordially invited to attend and participate. P. Barry, President; P. C. Reynolds, Secretary. The topics for discussion are of unusual interest. See p. 24.

Card. D. A. Fisher, proprietor of Home Nursery, Denver, Indiana. Fruit and ornamental trees, flowering shrubs, grape vines, roses, small fruit plants, greenhouse plants, etc.

Inter-State Industrial Exposition of Chicago. Reports of Secretary and Treasurer for 1878. Jno. P. Reynolds, Secretary.

Garden Guide and Illustrated Catalogue for 1879. R. H. Shumway, Rockford, Ill. Flower and vegetable seeds.

Everywhere.

NOTES FROM NORTH CAROLINA.

My Roses have bloomed in rich profusion this year. My custom is to prune closely during the winter. I find that fine charcoal is a very useful mulching for rose-bushes. In August I made some experiments in budding. One result was a magnificent Malmaison bloom in September on a stock of an old-fashioned Rose. Another was the beautiful contrast of a nearly pure white bloom among the dazzling Sanguineus. The flower seed which the Rural kindly sent, produced plants that promised well for a season, but some varieties perished in the trying summer.

The Strawberry Tomato flourished like an animal in its native element, and, behold, it proved to be what is common here—known generally as the Ground Cherry. The Hungarian Tomatoes grew well and were ready to bloom, but were nipped by the frost. The habit of the plant decidedly pleased me.

Last spring I received from the Department of Agriculture a few specimens of a variety of potato, marked simply No. 4, which I think I discovered to be the Beauty of Hebron. I planted them at least three weeks after Early Rose, Snowflake, and Early Vermont. The Beauty was planted with rather more care than the other kinds. It bloomed considerably before those that were planted so much earlier. It produced very satisfactorily indeed, both in quality and quantity, and was remarkable for the absence of small tubers. The experiment convinced me that it is second to no kind that I have seen tried in this latitude. I have preserved nearly all for seed.

I am surprised that more attention is not paid to the Fig in our country. This locality seems specially adapted to it. I have several varieties and would really hesitate to exchange them for any other kind of fruit-trees. If the first crop is destroyed by the cold, the unyielding bush or tree does not betray any discouragement, but works hastily on in the enterprise of reproduction. Hence, the fruit never fails while the tree lives. There is a continuous yield through the long months, from the time the second ripening begins to the day when a heavy frost falls. This year I ate the last about the 6th of November. The fruit is luscious and unquestionably wholesome. I know of no fruit that may be eaten so freely with impunity.

The farmers have had a favorable season for seeding wheat. However, our people, as a rule, are poor wheat-raisers. The crop needs more attention and better soil than they give it. New kinds of wheat are more appreciated than formerly, and the Agricultural Department at Washington, is distributing valuable varieties for experiment. A. W. Mangum.

Chapel Hill, N. C.

RURAL SPECIAL REPORTS.

New York, De Kalb, St. Lawrence Co., Dec. 27.—If I were asked to state what the weather had been in this part of the State for the past three months, I should say that we haven't had any. It has been rain, wind, snow and slush. The roads have been almost impassable, small creeks have become sweeping torrents, lowland has been submerged, hundreds of acres presenting more the appearance of lakes than tillable land. The wheat crop in this section was fair, the yield of spring wheat being about 25 bushels per acre, and some farmers report a yield of 50 bushels per acre of winter wheat. Oats were a light crop and of poor quality. Of barley there is not much raised here. Potatoes are scarce and high. Owing to the heavy rains in August and September they rotted badly; many farmers who had hundreds of bushels last year have not enough for next year's planting. Now and then, however, one is found who is fortunate enough to have plenty for his own use and a few bushels to deal out to his less fortunate neighbors.

A large share of the cheese factories have closed out the season's make at from 7c. to 9c. Now and then a factory has placed its cheese in winter-quarters, not being willing to accept the prices offered. This, I think, a bad plan, as it will tend to keep down the prices next spring. Wheat sells for $1; corn, 60c.; barley, 75c.; oats, 30c.; potatoes, 75c. to $1; butter, 15c. to 20c.; cheese, 7c. to 9c.; hogs, dressed, 3c. to 4½c.; hay, prime, $8 to $10 per ton. Of tramps, lightning-rod agents, tree-peddlers, etc., the supply has been large and of about the average quality. With the advent of cold weather these are becoming more scarce, yet the supply more than equals the demand now. S. C. D.

New Hampshire, Dover, Dec.—The season of 1878 has been dry, but as the drought did not commence until about the first of July, the hay crop, the great staple of New England, was not injured, and as a consequence we have harvested in fine order one of the best hay crops we have ever had. Corn was good; the hot, dry weather of July and August was just what was required to mature it. A larger area than usual has of late been planted to this crop by New England farmers, for they have become convinced that it is better to raise what they need of it than to buy so much from the West. This change in their practice has been brought about in a measure by the introduction and use of various commercial fertilizers upon sandy soils which have been considered worthless, but which, by the use of these manures, produce fine crops of corn. Potatoes have been the greatest failure of any crop here; the Colorado beetle and the drought seemed to join hands to destroy them, and the result is that not half a crop has been harvested; and where in former years potatoes have been 50 cents, they bring to-day $1 per bushel. But to fill the place made vacant by so important a crop as potatoes are to the New England farmer, we have had an unusually large crop of apples. Although these have brought only a low price, owing to their abundance they have materially aided our farmers to pay taxes and other necessary outlays. And take it all in all, the farmers are as well off as any other class, and perhaps better off; still among them there is a good deal of grumbling about the unprofitableness of their occupation. R.

Arkansas, Van Buren, Crawford Co., Dec. 29.—On Dec. 25, at night, we had a heavy snow storm, and on the 28th, also at night, snow fell to the depth of five inches. I have lived here nine years, and I have also lived in Mississippi and Alabama, and to all intending to emigrate, for the purpose of farming for a living, I would honestly say, "This is just the place for you." Corn is worth 30c.; meat 2c. to 3c. per pound; flour $2 to $3 per hundredweight; stock, cheap; land, per acre, from $4 to $12; rents from $2 to $4 per acre, or ⅓ of the corn crop and ¼ of the cotton in the seed. There are 25 churches belonging to seven different denominations. Our schools, buildings and teachers, are equal to those that can be found in any county of the State. There are 22 steam flouring mills in the county. Among our non-agricultural industries are lumber-making and dressing from pine, walnut, ash, hickory, oak and gum. We have rail and river transportation. Cotton, corn, wheat, rye, potatoes—Irish and sweet—timothy, red-top, some clovers and all the millets do well here. Our fruits are equal to those of Indiana, Kentucky or Tennessee, including the Apple, Peach, Cherry, Apricot and a large number of different berries. Moreover, all newcomers with brains and energy are sure of a hearty welcome from all the settlers. B. E. L.

Ind., Oaktown, Dec. 28th, 1778.—This year gave us a warm open winter and early spring, but the weather was so rainy that corn was planted much later than usual. June and July were good months for farmers. Wheat was rather above the average and hay a better crop than usual. In the latter part of July a dry spell began and for over two months we did not have rain enough to fairly moisten the ground. Corn was cut short fully one-half; late potatoes were a failure. About the customary amount of wheat was sown in this county, but much later than usual because of the drought. We are blessed with plenty of small fruits and peaches, but we had few apples and those not as large as usual. The price at which wheat was sold, 75 to 80 cents, did not put much money in the pockets of our farmers, and the shortness of the corn crop and the low price of hogs, make many long faces among those who are in debt. H.

Ohio, Mt. Vernon, Dec. 30.—The weather has been very cold here for the last ten days, the thermometer standing steadily at about ten degrees below zero. There is a grand prospect for wheat hereabouts next season, if our winter wheat does not freeze out. Every one who can do so, is putting up a large supply of ice, which is twelve inches thick and very solid. Our markets are low, but easy; wheat, 95c.; oats, 20c.; corn, 25 to 30c.; potatoes, 40 to 50c.; rye, 60c.; apples, 20c.; pure cider vinegar, 12c. per gallon by the barrel; eggs, 20c. per doz.; butter, 15c. per pound. The subject of making gravel roads is much talked of among us. Our present roads are good, but we want better. Where every creek has a bed of gravel, it's a sin and a shame that the life of an intelligent community should be made wretched not only in winter, but after every heavy shower, by muddy roads. M. W.

N. Y., Adams, Jefferson Co., Dec. 30.—Crops during the past year were more than an average in this section. Corn is worth 50c. per bushel; oats, one cent. per pound; potatoes, $1 a bushel; barley, about 75c.; apples, $1.75 per barrel; butter and cheese have just now very little sale here, most of the dairy product lying at the factories waiting for buyers. Pork and beef, $4@4.50 per hundred. Our farmers raise a good deal of beans and peas for seedsmen, but they have become so particular about their quality, and there is so much docking by the purchaser, that farmers would do better by raising almost any other kind of crop for market, rather than submit to the deductions made in the price when they deliver their seeds. T. C. C.

Texas, McKinney, Dec. 26.—We now have an inch-deep snow on the ground, and have had a considerable amount of cold weather for Texas. "Hard times come again" is murmured around here. Red May wheat is worth 50@60c. per bushel; pork, 2@2½c. gross; beef, 2¾@3c. gr.; sweet potatoes, Bermuda and Brazilian Yams, 75c.@$1 per bushel; corn, 20@25c.; red winter oats, 30@35c.; eggs, 10@12½c.; butter, 25@30c. This county has passed in the last ten years from a grazing to one of the finest farming regions in this or any other State. Because the black-wax soil does not wear out, it does not require a manure dressing every year, although it will yield much better from its use than without it. W. N. W.

Vermont, Manchester Depot, Dec. 28.—Although as a people we are much better off than we were a year ago, yet some are continually whining about hard times and scarcity of money, as if they really enjoyed grumbling or as if it in any way improved their plight. Hereabouts, railroad section men get $26 per month; carpenters, $1 75 to $2 per day; teamsters, $10 to $15 per month. Hay is selling for from $8 to $12 per ton; oats, 38c. per bushel at the mill; feed and meal, $1 20 per 100 lbs.; new milch cows, $30 to $35; oxen from $100 to $150 per pair; pork, fresh, $4 50 to $5; beef, $5 to $6; cord-wood, $3; spruce boards, $8 50 per M; flour at retail, $5 75 to $7. E. L. T.

Iowa, McGregor, Dec. 26. The weather here is intensely cold, cold enough to satisfy the most ardent admirer of genuine, seasonable, wintry weather. It freezes the ink inside the bookcase, it freezes the thoughts that the ink should express, which accounts for the short-

ness of this. It requires no thinking, however, to remember the pleasure with which the members of our little circle read the contributions of Mrs. Annie L. Jack, and, indeed, almost everything that ever appears in the RURAL.

J. R. J.

IOWA, Tipton, Cedar Co., Dec. 28.—Our fall has been fine and dry. The corn was all gathered in good order, and was of an average yield. A good proportion of the stalks have been plowed under for spring seeding. On the 16th we had a snow ten inches deep. During the last few days, it has been somewhat cold, the thermometer ranging from zero down to 10 degrees below that point, with a keen wind that drove the cold cuttingly through those exposed to its sharp edge. E. A.

MICHIGAN, Watson, Allegan Co., Dec. 27.—We anticipate a considerable revival of business before winter is over, if this snow remains, as lumbermen have commenced operations on a grand scale, which makes a market for our produce. There is an abundance of everything in the country, so that if wages are low, prices are also low to match. A little money will go a long ways in furnishing food and provision for the poor. H. D. E.

OHIO, Bennington, Morrow Co., Dec. 27.—We are having fine winter weather with about five inches of snow. Feed is abundant and cheap. Fall wheat looked promising when the snow came. Wheat is worth 85c.; corn 30; oats, 20; butter, 12½; eggs, 16; hay $5 per ton. T. W.

N. Y., Perry, Jan. 2.—I have just sold for 90c. per bushel some good Clawson wheat that looked better than wheat I sold for $2 per bushel in 1873. Barley is worth 60c.; pork, $3.25 per 100lbs; oats, 25c.; other farm products in proportion. J. B. P.

ILLINOIS, Naples, Scott Co., Dec. 29.—Weather very cold here for past two weeks, thermometer sinking as low as 12 degrees below zero. Sleighing splendid. E. M.

KENTUCKY, Danville, Dec. 26.—Clear and cold, with five inches of snow and the thermometer steady at 16 degrees below freezing point. A. F. M.

The Querist.

ANSWERS TO CORRESPONDENTS.

Bee Queries.

M. W. Mt. Vernon, Ohio, asks 1. which beehive is preferable—the American or Langstroth's; 2. how far must Italian bees be kept from other bees to prevent the former from mixing with the latter. 3. Is it advisable to buy Italian bees mixed with brown bees to start an apiary; 4. would not an eastern slope, protected on the north and west, be a good site for hives.

ANS.—1. Langstroth's we think is generally considerd the best hive in use. 2. They can stand side by side without mixing, unless one is raising queens, then about three miles would be a suitable interval. 3. Yes, if the queen is a pure Italian, and her young bees have the three distinct yellow bands on the abdomen characteristic of Italians, otherwise not. 4. Very good, but the hives must also be shaded from the hot sun, by low evergreens or shrubs. To judge from your questions if will be advisable for you to study a good treatise on bees before starting an apiary. Cook's Apiary is perhaps as good a one as any, published by T. G. Newman & Son, Chicago.

Wanted, a Good Farm in W. Va.

A Constant Reader, Syracuse, N. Y., intending to move to W. Va., for farming purposes, wishes to learn in what part of that State the best and cheapest lands and at the same time those most convenient to market can be purchased.

ANS.—A number of communications from different parts of W. Va. have appeared from time to time during the past year in the RURAL under the heading Everywhere. For these we refer "Constant Reader" to the full index we have lately issued. The word "cheap" is often used as a synonym of low-priced, and it is hardly probable that the best land, most convenient to a good market, can be bought in any State at the cheapest rate, if the word is used in this sense.

White Grubs.

L. G. W., in the RURAL of Nov. 9, complains of the White Grubs eating the potatoes. Let him sow broadcast, after planting, a half bushel of salt either from meat pickle, fish barrels, or any other cheap salt, and he will have no more trouble. He need not fear damage to the crop, as five bushels to the acre cannot hurt any crop. Salt in the soil attracts moisture which is congenial to most growing things. S. R. M.

Holding Grain.

A. S., Helper, Kans., asks, "would the RURAL advise farmers to hold back their grain for better prices, and if so, how long?

ANS.—We could not offer advice upon such a subject. Our "Everywhere" and market reports will prove our friend's best guide. In our "news" columns, also, the state of the crops and any important movements in the grain trade across the Atlantic, are mentioned whenever we think our readers can be benefited or instructed thereby.

Cutting Back Privet Hedges.

J. E. C. Kings Co., L. I., inquires about cutting back a privet hedge.

ANS.—It may be cut back at almost any time. The beauty of such hedges depends upon a severe annual pruning. They should be cut back to within two feet of the ground. The annual growth in what is called the California Privet is as much as eight feet. If this is left, the plants soon become leggy and by no means ornamental either in hedges or as single specimens.

Muck from an old Mill Pond.

E. A. G. Greenville, S. C., asks whether muck from an old mill pond would make a good manure.

ANS.—Yes. For the best method of preparing it, see RURAL of January 4, page 9, under heading, "History of a Poor Farm."

Huckleberry Culture.

W. B. Y. Norwich, asks how to cultivate Huckleberries.

ANS.—We do not know. Many have tried, but nobody has as yet succeeded, and we are inclined to think nobody ever will.

How to use Superphosphate.

G. H. Mayfield, O., asks how to use superphosphate.

ANS.—Mix it evenly with earth—the more of the latter the better. Sow it then broadcast and harrow in.

Miscellaneous.

M. H., Isle La Motte, Vt., asks 1, Where he can get the Prolific corn about which so much is said. 2, where can he buy thoroughbred cattle without having to pay fancy prices for them; he wants twenty or thirty yearling calves to start a dairy.; 3, the name of a reliable work on manures; 4, also, of one on grasses and forage plants; 5, will buckwheat eradicate couchgrass.

ANS.—1. We do not know what corn is referred to. There are many so-called "prolific" varieties of corn. 2, Try Smith & Powell, Syracuse, N. Y. 3. Harris's Talks on Manure is as good an authority as any. 4, None better than Flint. 5, We should say, no.

R. S. M. Peter's Creek, Stokes Co., N. C., asks whether we have ever experimented with Chufas and if so, whether we think they could be profitably cultivated for hog food.

ANS.—Yes, we have experimented with Chufas and do not believe they can be made to pay, at least in this section of the country. In the Southern States, however, especially in those along the Gulf, many speak favorably of them for hog and poultry feeding.

A. W. M. Chapel Hill, N. C., asks whether Pyrus Japonica has been used successfully as a stock in either budding or grafting, and whether it ought not to take to the varieties of the Apple.

ANS.—We do not know as to the Apple, but should say it would not prove of any value. It dwarfs the Pear and a late writer speaks of it in strong commendatory terms for that purpose.

C. T. M., Canandaigua, N. Y., asks the names of authors and publishers of best late works on peach and grape culture for a beginner in fruit culture.

ANS.—We do not recall any standard book about Peaches alone. Downing's Fruits and Fruit trees of America, Thomas's Fruit Culturist and Barry's Fruit Garden give all needed instructions. They can be secured through this office.

B. H, Kingston, Luzern Co. Pa., asks for the name and place of a manufacture of a horse-power corn-husker that works successfully.

ANS.—Phillip's Spiral Corn Husker, Chas. H. Mallison, Hudson, N. Y., is the best that we know of; it has proved quite a success.

James Truitt, Chanute, Kansas, asks for the address of Thomas Roe, Monroe Co., N. Y., and where he can get a few cions of the Stump Apple.

ANS.—1. We do not know. 2 Of any good nurseryman.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JANUARY 4th.

"Farmer's Garden," no name or advice—R. C. C.—M. B.—C. T.—S. R. M.—C.—A. R. C., seeds will be sent before spring—M.—W. J. F.—S. B. P.—L. S. H.—H. S.—C. A. R.—T. H. H.—L. A. R.—S. R. M.—C. S. C.—A. L. "RURAL NEW-YORKER."

Professor E. M. SHELTON of the Kansas Agricultural College says:

"*The* RURAL NEW-YORKER *has more influence and is more quoted than all the rest put together.*"

For the largest Farms—the smallest flower plots—for the crops in the fields—the vegetables and small fruits in the garden—for the Herdsman, the Dairyman, the Apiarian everywhere.

For the Country, Village and City---For everybody that loves his home and desires so to elevate agriculture and horticulture that they shall be recognized as the noblest pursuits of men.

B. PICKMAN MANN of Cambridge says:

"*For years I have taken the leading agricultural journals, and they all seem* TAME *when compared with the* RURAL NEW-YORKER."

The most vigorous and able combination of practical writers ever before collected together in the columns of any journal.

2d YEAR OF ITS PRESENT MANAGEMENT. 30th YEAR OF ITS AGE.

Thousands of new Subscribers from all parts of the Country---Our old Subscribers united in enthusiastic expressions of approval and support.

Professor WM. J. BEAL of the Michigan Agricultural College:—"*The* RURAL NEW-YORKER *is now the* BEST *paper.*"

CHARLES DOWNING says:—"*I am glad for the public as well as for yourselves that the* RURAL *has so much improved.*"

Thousands of plant cuttings and seeds have been distributed free to subscribers during the past year—and our present Free Distribution of Seeds will, we believe, when they shall have been tested, be regarded as the most liberal offer of the kind ever before made.

Pearl Millet and Defiance Spring Wheat (now selling at not less than $20 per bushel each)—the Beauty of Hebron Potato—Golden Rural Tomato, Bronze Ricinus and sixteen varieties of seeds of our choicest hardy shrubs (most of which are not offered for sale), will be found in our present collection. (See page 33.)

Pres. T. T. LYON of Michigan says:—"*The* RURAL *is the best paper I see.*"

Sec'y C. W. GARFIELD of Michigan says:—"*I find that the* RURAL NEW-YORKER *has more things in its columns that I want than any other paper I take.*"

Ex-Gov. FURNAS of Nebraska says:—*The* RURAL *is most welcome to my table and family.*"

Dr. E. LEWIS STURTEVANT of Boston says:—"*The* RURAL NEW-YORKER *has the best list of contributors of any paper of its class in the country and is doing a noble work.*"

S. RUFUS MASON of Nebraska says:—"*I feel that I do not flatter anybody when I say that it is the* BEST *journal of its kind that I ever saw.*"

THE ACKNOWLEDGED HEAD OF THE RURAL PRESS.

SUBSCRIBE NOW!!

$2 per year to ALL alike---No club price.

The Cheapest, Largest and Best Family Journal in the World.

You cannot afford to do without the Rural New-Yorker for 1879. It will interest and instruct every member of the household, and it is the earnest desire of the management that it shall in every way prove worthy of the unqualified trust and respect of its readers.

N. B.—Our Farm and Experimental Grounds of 82 acres are devoted to experiments of all kinds appertaining to plant life and the best agricultural and horticultural methods. New plants of all kinds adapted to the climate are tested and reported upon according to their merits. We cordially invite—indeed solicit—our subscribers to communicate ANY FACTS which they may deem of interest to the general reader.

Address all communications

RURAL PUBLISHING CO.,
78 Duane St., New York.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, JAN. 11, 1879.

We will be pleased to send one or more copies of the RURAL NEW-YORKER *free to any of our subscribers sufficiently interested in its welfare to be willing to hand them to their neighbors for inspection. An intimation by postal card will suffice.*

OUR readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to* THE RURAL PUBLISHING CO., *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

OUR readers are particularly requested to read the particulars of our free seed distribution on p. 33, under publisher's notices, before ordering seeds.

WE offered, some time ago, to sell the cuts used in this Journal for twelve cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

Applicants for seeds will please observe that the postage on ANY POSSIBLE *selection of* TEN *sorts of seeds,* IS NEVER *more than* FIVE *cents. A* ONE-CENT *stamp suffices for any selection of ten varieties* EXCLUSIVE *of the Beauty of Hebron potato, Pearl Millet and Defiance wheat. If the first of these three is included in the list, then a two cent* EXTRA *stamp is needed, and if the second and third are included, an extra two cent stamp is also required.*

HOG CHOLERA.

THE disease known as hog cholera has, within the last quarter of a century, extended its limits to such a degree as to be little less than a national calamity. It appears from time to time in nearly every State in the Union, and causes annual losses reaching at times the enormous amount of twenty to twenty-five millions of dollars.

We say the disease has been extending its limits, and we wish to call particular attention to this fact. Thirty years ago it was unknown in the New England, Middle, Southern and some of the Western States; why is it that none of these districts are at present free from it? We know that hundreds of those who will read this question stand ready with an answer—but scarcely two will agree. Some will claim that it is caused by errors of diet; and even here there is a variety of opinions; one will say, too much corn—an excess of carbonaceous elements in the food. Another is ready with an opposite opinion: too much clover—an excess of nitrogenous elements. Another class harps on high breeding, pampering, and weakened constitution; while still others are equally sincere in the opinion that the cause exists in the restricted range, over-crowding and filth to which many hogs are subjected. Each man will stand ready with facts to prove that he is right, and that a proper application of his views will rid the country of this dreaded malady.

But whence comes this variety of opinions? Are *facts* so deceptive as this? No; facts are not deceptive; it is simply the careless observation and explanation of facts that make so much trouble—it is the accepting for a fact that which is not a fact. If a man's hogs escape the disease while his neighbors' die of it, he attributes this to something he has done to prevent it—he has fed them ashes, or coal, or soda, or copperas; or he may claim this immunity is due to his breed, which has a better constitution, or he has fed them corn, or clover, or buttermilk; or his land is clay instead of sand; his hogs have been on sod instead of stubble, or his field is surrounded by an oak fence instead of a chestnut one. In the presence of all these conditions, however, how does he decide which has actually been the preventive one? There is no use in disguising the matter, he simply guesses at it—and then publishes to the world as a fact that which is only a guess. His hogs have escaped—there is the fact; why they have escaped is and must be guess-work till a large number of cases are observed, *all* of which point in the same direction.

To illustrate how some of our writers succeed in making their theories plausible, we will take the most absurd of the preventive conditions mentioned. A man's hogs have escaped, and in seeking for the reason he observes their pasture is surrounded by an oak fence; he hears of another person's hogs escaping—investigation shows they, too, were inclosed by an oak fence, while most of the neighbors have used chestnut. At another place the animals which were not attacked were within a chestnut inclosure—this fact is incomprehensible, but it cannot overthrow the other facts which he has collected, "the majority must rule," so it is not recorded; but he continues his investigations, accepting those facts which agree with his opinions and rejecting all others. Is it any wonder that he soon has an array of facts which *prove* that an oak fence will prevent hog cholera? Ridiculous as this may appear on paper, it is just what some very intelligent men have been doing for years; it is the kind of research that has been filling column after column of our agricultural journals; and such men have influence and thousands accept their doctrine!

We can point to instances, however, where none of the causes so often invoked were present, and yet the hogs died to the same extent as elsewhere. The fact is, no breed is exempt, no section is so salubrious as to be free, no conditions of diet, of surroundings, of range, appreciably lessen the death rate. The disease is a contagious one, and as long as we neglect the essential cause of the disease—the contagious germs—so long we will suffer from it. No diet will prevent one from contracting small-pox or yellow fever; nor can any preventive measures be effectual short of limiting the production and spread of such germs, and destroying those already existing.

It is now certain that a part of the commission appointed under Act of Congress to investigate this disease, will recommend measures for stamping it out; and to accomplish this result, we must have further Congressional action—action which will not be taken unless a united demand is made for it. As a people, we are always ready to investigate—but very often we stop with the investigation. Let us remember that no amount of investigation can free us from this disease, unless we enforce the measures which are indicated. To stop with the investigation is like sending for a doctor in a case of serious illness and expecting to be cured without taking his medicine or following his recommendations.

An expenditure of a small part of the sum annually lost from hog cholera, will, in a few years, free the greater part and possibly all of our country from its ravages. Shall the expenditure be made? Shall such a pressure be brought to bear on Congress as to force this action, or will we strain at the gnat and swallow the camel?

DRUDGERY.

EVERYBODY dislikes the continuous labor which is styled "drudgery." Drudgery, as the word is usually understood, means working whether you like it or not, and working steadily at a task until it is done. We say it is universally disliked, and yet no great thing can be accomplished without this same steady work. Drudgery, steady perseverance through thick and thin, carries the day and takes the prizes right away from genius, talent, wit and skill that cannot or will not drudge for them. "Is there anything in the world," asks Thackeray, "that cannot be accomplished by sheer hard work? Grant to any man, high or low, a sound natural capacity, and may he not aspire, with a reasonable degree of certainty, to the very grandest prizes which the Heads of the Houses of Life have to confer? May he not say to his will: 'You are my steed, I mean to saddle and bridle you. I shall spare neither whip nor spur, and you must carry me to the great goal. Be your name Hare or Tortoise, you and I must win the race.' Believe me that nothing is unavailing towards the great end, so long as it is work. The making of sundials and toy windmills helped Isaac Newton towards the *Principia*. Bacon was not wasting his time when he wrote about laying out gardens. Brougham took something by his motion when he sat down to furnish nearly an entire number of the Edinburgh Review. Burke found his account in writing summaries for the Annual Register, and Canning in making jokes for the Anti-Jacobin. All these things 'tell up.' They are columned and figured and entered to our credit; and some day the balance is declared, and we draw the splendid capital."

The worst feature of our times is the indisposition on the part of young and old, male and female, to that steady toil that is the price of all solid success. The terrible failures, the great break-downs of character, the defalcations, the peculations, the swindles, great and little; yes, and the robberies and burglaries occurring all around us, are the fruits, natural and legitimate, of the refusal to drudge on in the path of honest, patient, useful work. Our prisons and alms-houses and mad-houses are full of the wrecks of men and women who would not drudge.

The power of steady, patient and continuous work seems to be lost among a large class of our people. The education and the example of the past twenty years have been unfriendly to the homely virtues, of which perseverance and patience are not the least. "Nothing is denied to hard work"—"everything comes at last to him who can wait"—"learn to labor and to wait"—are three aphorisms that seem to have become obsolete and forgotten, yet they embody the sound wisdom that has grown up out of the experience of all past ages. Shutting the eyes to them will not blot out their truth, though it makes it useless to us.

It is among the farmers more than any other class that the old-time virtue exemplified in the willingness to drudge, yet remains. It is from amongst them that must come out those who are to replace the failures of the past generation among the professional and business ranks. Let them come fully grounded in the understanding that the only royal road to honor, fame and happiness lies far across the apparently weary waste of "drudgery." But, like the "Great American Desert," it is not as bad as it seems. Moderate compensations attend the patient traveler on his way. There are restful stations, refreshing springs, some grass and many flowers along the path. And when the summit of the "divide" is reached, there is a glorious outlook that can be gained in no other way.

EVENING AMUSEMENTS.

THE long winter evenings are here, when the boys and girls in the country, yes, and the men and women, too, are saying, "What can we do to amuse ourselves to-night?" Reading and study can be done to such an extent as to become wearisome: "all work and no play makes Jack a dull boy." The mind needs relaxation as well as the muscles; and no less work, mental or physical, will be accomplished if an occasional hour be given to diversion and entertainment. Lyceums, lectures, singing-schools, and an occasional sleighing party in the Northern States give opportunities for the meeting of young people; but we are thinking more particularly of home affairs, and of cold stormy evenings when only the family assemble, or perhaps a near neighbor or two drop in. How shall the hours be passed agreeably, amusingly and entertainingly?

It is only a few years since of games for children there were only Fox and Geese—Twelve-men-Morris Hull-gull—and a few more of the same sort. Cards were, as a rule, not allowed, but exceptions were sometimes made if nothing wickeder than "Old Maid" was played. But the number of games and amusements adapted to homes is yearly increasing, and there are now so many that the trouble is which to choose.

There are few games in which something more than mere amusement does not find place. Mere games of chance, of which there are very few, are not entertaining. Take Dominoes, for instance, a game in which children can find much pleasure, and still one which to play well requires good memory and sound judgment. In Checkers (or Draughts), and Chess, there are no chances involved. Thought, foresight, calculation, caution, all the mental faculties must be brought into action by those who would play either of these games even passably well. At Backgammon much depends on the cast of the dice. So much is chance; but the proper moving of the men requires intelligent consideration. In such games as Authors—Busby and the like, those with the best memory are winners of the game.

Temperance in all things should be the rule. Amusements may easily be carried to excess and time wasted by them that could be well spent in some other way. Study may be carried to excess and the brain overworked until it becomes worn out or useless; but study should not be condemned on that account. Labor may be carried to excess and the whole physical system break down under it; still "It is noble—'tis God-like to labor."

We should not forget to mention music, and dancing. There are no more profitable hours in a household, whose members are so fortunate as to be blessed with musical talent, than those spent in its use. Probably there is nothing that aids more in binding closely the family ties and promoting family love and harmony than music; and they are worthy of condemnation who, having the power to make music either vocal or instrumental, do not cultivate it.

Of dancing we are not earnest advocates further than in the home circle and among children. Here it may undoubtedly be indulged in, not only without harm, but with profit. We prefer therefore if dancing, as very generally practiced at the present time, is to be commended, it be done by other pens than ours.

BREVITIES.

POOR seeds are dear at any price.

LANGSHAN fowls are the latest sensation among poultry fanciers.

IT was Edgeworth who defined a fool as a man who never made an experiment.

AND now sticklers for grammar insist that the pests should be called trampers instead of tramps.

POULTRY enthusiasts talk about 200 and even 225 eggs per year. So far as we know or have heard, a true, fair record would put an end to such misleading stories.

WE hear that Mr. Thomas Meehan, editor *Gardener's Monthly*, will be a candidate for the Common Council of Philadelphia. We do not believe the report. Politics and horticulture will not mix.

MR. S. B. PARSONS suggests, in notes to the *Gardener's Monthly*, mixing the Retinospora with the Hemlock for hedges—which seems to us a suggestion of much value. The only setback is that the latter grows faster than the other. Cutting back remedies this difference in a measure.

THE seedling culture of Abutilons is very interesting. We advise our floriculturally inclined readers to try it. The flowers especially, and also the leaves are different in almost every plant. Crosses between the whites, such as Boule de Niege and the orange Darwinii or Thompsoni are easily effected.

ALL who till the soil should look upon every dead animal and plant as so much food for animals and plants of the present or future. The deprivation of life is the beginning of decay, or, in other words, the beginning of a return to the mineral kingdom which supplies plants with what we call their ash constituents.

THERE is but one plant, so far as we know, that potato beetles seem to prefer to the potato, and that is the Matrimony Vine, Lyceum barbarum. These grow from cuttings as readily as Willows. If, as we presume, the potato grubs and beetles would first infest such a hedge, Paris-green might be applied to it instead of to the potato plants.

NEW HAMPSHIRE'S late laws imprisoning tramps have completely rid that State of the vagrants. Vermont is following New Hampshire's example with results equally satisfactory. Providence has opened a wood-yard where the unemployed can earn fifty cents a day sawing firewood, and makes money by it from the labor of the industrious poor, but tramps do not ask the aid of Providence.

So little public honor has hitherto been bestowed on those whose labors have advanced the interests of the agricultural world, that it is a rare satisfaction to learn that 120,000 marks have been contributed towards the expenses of a fine bronze statue to be erected at Munich, as a memorial to the late illustrious Baron Justus von Liebig, whose studies in agricultural chemistry have so largely benefited farmers everywhere.

WITHIN a few days of the same date, chicks were hatched out at the RURAL Grounds from Partridge Cochins, Black Hamburghs and Plymouth Rocks. The last mentioned were the first to lay—the first ready for table use, and the first to mature. Of the brood of ten, two are black—larger than the others and the first to lay of the Plymouth Rock brood. If the Plymouth Rock can be considered a fixed variety, these two black hens may be considered "sports," or as reverting back to one of the original progenitors.

THE Canary Bird Vine is an annual with which our readers are familiar (Tropæolum peregrinum). We remember to have planted, years ago, seeds of this as well as of the Balloon Vine (Cardiospermum halicacabum), the Maurandya and Morning-Glories along a board fence, giving a southeastern exposure. In due time, they covered the fence, clustering upon the top and hanging over in entangled festoons. Early in the morning this vine-covered fence, during August and September, presented a sight more beautiful than can be described.

HUMBUG.—We find that fluid extract of Eucalyptus globulus is having a large sale among druggists for the cure of malarial disabilities. We have no right to assert anything regarding its febrifugal qualities, but we may be permitted to say that we do no believe it has ever cured a case of chills and fever or that it ever will. This tree has been much talked of because its roots imbibe a large quantity of water. Hence it was suggested to use it to *dry up* swamps. Hundreds of other trees would answer the same purpose. Fluid extract of Weeping Willow will prove just as effective in assuaging grief as fluid extract of Eucalyptus globulus will be found in assuaging malarial disorders.

For Women.

CONDUCTED BY MISS FAITH RIPLEY

THE FARMER'S LESSON.

If I had told her in the spring
The old, old story briefly,
When sparrow and robin began to sing,
And the ploughing was over chiefly!

But haste makes waste, and the story sweet,
I reasoned, will keep through the sowing,
Till I drop the corn and plant the wheat,
And give them a chance for growing

Had I even told the tale in June,
When the wind through the grass was blowing;
Instead of thinking it rather too soon,
And waiting till after the mowing.

Or had I hinted, out under the stars,
That I knew a story worth hearing,
Lingering to put up the pasture bars,
Nor waited to do the shearing!

Now the barn is full, and so is the bin,
But I have grown wise without glory,
Since love is the crop not gathered in—
For my neighbor told her the story!

EDITORIAL NOTES.

Any ladies who may have failed to receive patterns ordered from this office will confer a favor by dropping me a postal card, stating number of pattern, bust measure, and date on which it was ordered.

Linda Herbert.—I would advise you to wait for two or three weeks before purchasing a cloak, by that time the storekeepers will close out their stock at low rates.

Miss L.—Pretty photographs 36x28 can be bought as low as 75c. and $1, and beautiful imported photographs, a little smaller in size, cost $1.75. Many houses sell off their pictures at much lower rates than those given above, just after the holidays. A handsome natural wood frame costs $2.50 in New York.

TEA-TABLE COVER.

The finished cover is shown in No. 1. The center is art canvas, embroidered with crewels. The border is composed of alternate squares of guipure netting and embroidered art canvas, as shown in Nos. 2 and 3, and a fringe with a heading of drawn threads, ornamented with long stitches in crewel, as shown in the design, No. 4. The fringe and the border of squares are separated by a narrow border, as shown at No. 5. The different parts are sewn together, and the cover lined with art canvas or silk, according to taste. Directions for Crewel-Work were given in a late number of the Rural, and Guipure Netting will be given in a week or two.

LETTERS FROM A COUNTRY GIRL.—No. 10.

MARGARET B. HARVEY.

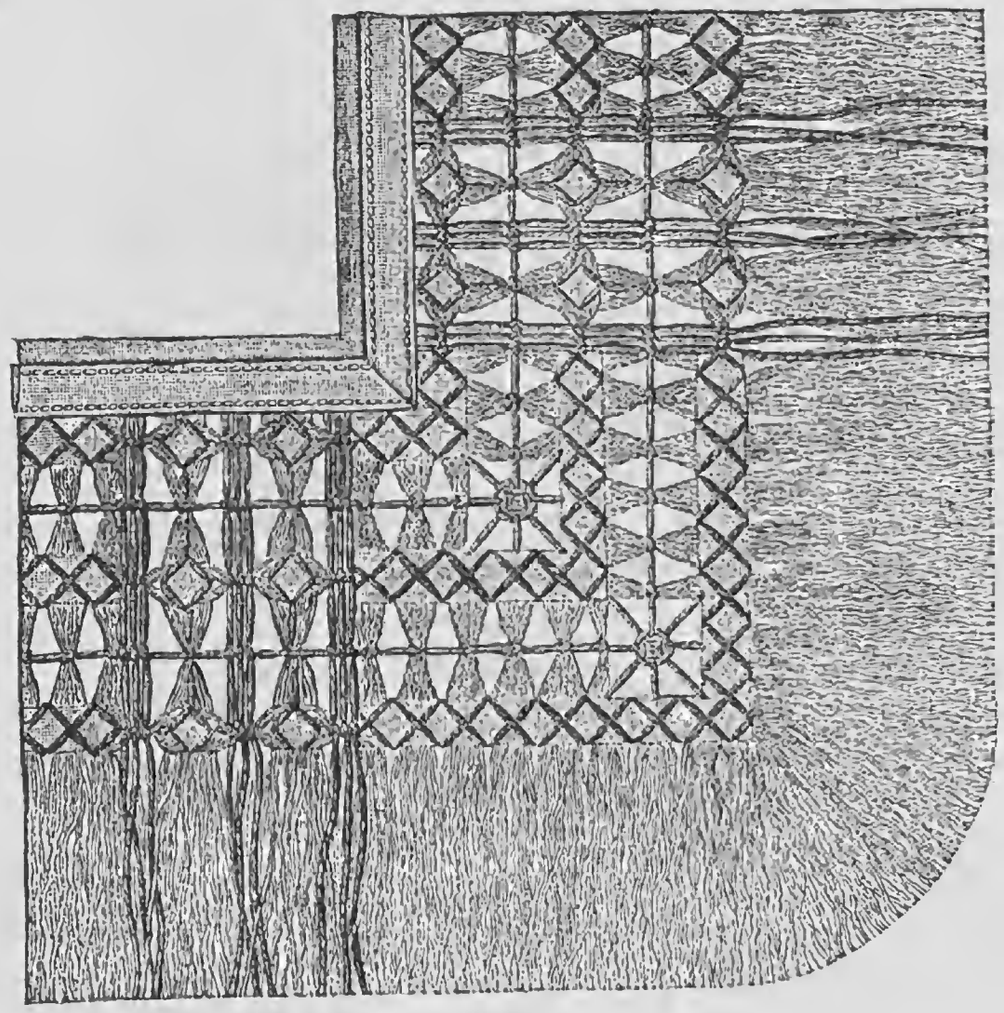
Incidentally throughout my letters I have referred to the advantages of possessing a knowledge of drawing. I fully believe that, scattered over our hillsides and hidden within our valleys are hundreds of girls and women dowered with a dormant power to copy or create, yet who feel that this one little gift can never be brought to light because no one has told them what to do. With the humble hope that what I say may be of some value, I assert first, that it is not nearly so difficult to become proficient with the pencil as is generally supposed. Of course, high art is one thing,—but ordinary delineation and shading, with satisfactory results, are within the reach of all who are willing to persevere.

To begin with, it is well to know something about the materials required. For a beginner, coarse gray cartridge-paper is best as a foundation,—better, even, than the common white drawing-paper, as it bears more rubbing and does not soil so easily. Then she wants one of Faber's lead-pencils, such as are sold for every day use, and a diamond rubber. After a learner has acquired a degree of skill it is time enough to think about Whatman's fine tinted papers and Faber's cases of polygrade pencils,—though I have seen very creditable drawings by young persons who never had either,

I would now get a light, smooth piece of pine board of a size suitable to hold on the lap, or rest on the edge of a table, or lay flat on a slightly sloping desk, as most convenient. Then I would spread my paper flat upon it, pushing a tack into each corner to keep it firm and smooth. Tacks for this purpose can be procured at any store for the sale of artists' materials, at the rate of about a cent apiece,—they have sharp points and large brass button-heads and, sink into the wood easily upon pressure with the thumb. A set of four may be used a long time.

I would not be too ambitious at first, neither would I be too trifling. I would not attempt to draw my father's barn, nor would I begin on straight lines, but I would try something simple, yet giving me an opportunity to see what I was doing. For instance, my fair friends, take the outline of a leaf, or the figure of an animal as given in the columns of the Rural. Judge by your eye how to arrange your lines so as to have your work in the middle of the paper, and begin at top or bottom or side or corner, suit yourself as to where you choose your starting-point. Only having taken one, let every line bear upon it, and be capable of being tested by measurements from it.

It is well to have little strips of paper for gauges. I will suppose that you are attempting to draw an ivy leaf, and have commenced at the extremity, directed upwards. Looking at your pattern you observe that the two lines defining the upper lobe diverge from this point to nearly an equal distance, so that a horizontal line joining them at their ends would form with them the boundary of a triangle not quite equilateral. Draw each of these lines, putting in the little curves according to the model, and then with your gauge measure each and the space between them, and see how nearly they correspond to the original. It is advisable never to erase a mark if it can be helped; but if it can't, that is, if you need to alter, the case is different. Make corrections until you are perfectly satisfied,—and don't be surprised if this should take you



No. 4.

hours. You will find the good effects of it by-and-by, when your eye and hand have become so well educated that a glance and a touch are sufficient.

The upper lobe finished, do the others in the same way. Get their distances apart, the length of the line between their apexes and that of the topmost part, the distance between this last and the stem. You have not finished your outline until it does actually describe an ivy leaf. Now put in your veins. The main ribs, as you see, divide the leaf into sections. Make these suit you exactly, and then you will find it very little labor to draw the short, wavy lines which represent the secondary markings.

You may, if you like, go on with the shading, or you may lay this piece away until you have become more familiar with the form. In any case, remember that you are to hasten not only slowly, but very slowly. Give as much effort to the turn of a curve as to half a page in a composition. And don't bear on too hard with the pencil, or your drawing will look too cold, sharp and black.

For a long time you must be content to copy shadow as you see it in pictures. But you will soon learn that very deep depressions have very dark shades; less, less; still less, less still; and that the parts which stand out are light, the effect of the shadow being to throw them forward. These depend on the light represented in the scene or upon the object. The conventional manner of its falling is from the upper left-hand corner, at an angle of forty-five degrees, so that the lower right-hand corner generally receives the greatest amount of darkness—though this rule is far from invariable. But observe lights and shadows—their form, direction and intensity—in nature, even while you are imitating set models, so that by the time you are able to invent you will have learned how to finish agreeably and correctly.

The manner of putting in the shading differs with the strength and habit and degree of delicacy of every individual hand. Some draughtsmen make a vast number of crossing lines of different degrees of heaviness, describing infinitely small lozenges; some make similar lozenges, with scattered lines running through them, up and down or from side to side; still others, blend their lines in no particular fashion. The only rule is, taste and practice, and this, too, is after all, the only rule for drawing.

Continue as you have begun until you can copy little scenes, first, by developing all the lines from the starting point, and trying their correctness by measurement, and then by lightness and heaviness of touch working in all the lights and shadows, until you can sketch from nature; first, by outlining a number of objects on a reduced scale and in true proportion, and then, by finishing them according as the brightness and darkness actually appear to you.

If you wish to draw from a large picture, in which the multitude of lines and variety of distances might confuse you, the work can be facilitated as follows: Rule over the surface of it a number of horizontal and perpendicular lines, every two lines running in the same direction being exactly the same distance apart, so that the whole pattern is covered by a number of precisely equal squares. Do the same upon the paper. Then the two, so far as rulings are concerned, are perfectly alike. Then put in, square by square, as much of the whole outline as appears in each. The shading will cover most of the lines, and those exposed can easily be rubbed out afterwards. If a drawing be upon white paper, the high lights are made by leaving it uncovered; if upon tinted, they are put in with a few judicious touches of white crayon,—not many, or the whole effect will be gray and chalky.

Crayon-drawing is most exquisite, and some of the productions of the artist on crayon are equal to fine oil paintings. Yet any one who can draw well in pencil ought to do just as well in crayon, making very pretty little sketches and beautiful heads.

Black crayons come in three grades of hardness, and cost seven cents for three—white ones, each five cents. Whatman's tinted papers, in soft grays and buffs and greens, are fifteen cents a sheet, each one being very nearly half a yard square. A stump, resembling a gray paper cigar, is ten cents; but you may be able to do without it. There is also a crayon-holder, but the brass tube on the top of a pen or pencil will answer the purpose, if you want any such contrivance at all. I never used one.

The outline is generally drawn with pencil or prepared charcoal, which is easy to work with, as it rubs out so readily. Crayon does not rub out, but makes a ruinous smear. (By the way, crayon-drawing is about the dirtiest work any woman can do. It is necessary to have a basin of water and a towel close at hand to be used every other minute, or else an inadvertent touch may spoil forever a most beautiful creation, the labor of months.) As to shading, it differs little from that required in pencil-drawing, except in the completed work the lozenges may be larger and more apparent. Then, too, it is not possible with the point of the crayon to blend as perfectly, hence this is done with the little finger, and the stump, or a crumpled bunch of coarse paper taking its place. In other words, in looking closely through the appreciable black lines in the shading, we must not see a light appearance, as of the bare paper, but one of a smooth, solid, cloudy gray. This is caused by the blending of the groundwork before the heavier lines are put on. Don't be frightened if your drawing looks coarse, crayon-work won't bear examining. See if the effect is good.

There are patterns sold for crayon-drawings (as there are also for pencil-pictures) which would be well for a beginner to have. By following them closely she will see what I mean, and then, perhaps, design for herself. These do not cost much and can be sent by mail. I am able to give the address of a house for the sale of artists' goods to any who wish it.

You may, if you try, before very long, be able to adorn your home with your own pretty pictures. How delightful that will be! I do think, in a moderately furnished room, nothing so effectually banishes any suspicion of a common, tawdry appearance, as well-executed drawings. But they must be framed, and if you don't know how to do that I will tell you. A drawing, especially if on tinted paper, looks best with a wide mat, usually white, around it, and the frame itself must be very simple. A plain, flat walnut band, with or without the merest suspicion of gilt within it, is very suitable the natural-hued, oiled woods, with perhaps a slight ornamentation in black at the corners are the fashion at the present time. If a tiny crayon head has a white mat around it, the beauty may be heightened by a few bright illuminations in water colors upon the margin, and then a flat band of dead gold will frame it fittingly. But never degrade your lovely effort by associating with it a cheap stained affair suggesting a staring lithograph, nor load it down with a cumbersome gilt appendage, appropriate for the ancient portrait of your great-grandmother.

LADIES, LEARN TO DRAW.

No. 1.—TEA-TABLE COVER.

Literary Miscellany.

GONE.

Gone with its joys, its hopes, its fears,
Gone with its smiles, gone with its tears,
One more link to the chain of years,
Another year has gone.

Gone with its weary toils, its strife,
Gone with its sorrowful record rife
Of broken vows and wasted life,
Another year has gone.

Gone with a sigh, gone with a groan
From hearts full of sorrow unknown,
Wafted up to the Great White Throne,
Another year has gone.

Gone perchance with a few bright days
Found in hidden paths and ways,
Mingling with joyous notes of praise,
Another year has gone.

Gone to its rest; it sleeps at last,
Down, deep in the vault of the Past,
Where the years lie, in number vast,
Another year has gone.

WHAT HAPPENED TO SEVEN GIRLS IN TEN YEARS.

MARY WAGER-FISHER.

Once upon a time in the city of Richmond, Va., (to be exact, it was upon New Year's Day, 1867,) six girls sat on the floor around a stove in a comfortably furnished room that served as bedroom and sitting-room to two of the number—Mary Walter and Zethrea Raynor. The names of the other girls, respectively, were Martha and Mary Cake (for short they were called "the Cookies"), who were sisters, and Cornelia Jaynes and Mary Roswell. The seventh girl—for they "were seven"—Mercy Biddle, was "up North," in Maine, her native State, begging her people for money for the Normal School building, which was to be for the accommodation of colored pupils in the capital city of Virginia. The six girls, as I have already remarked, sat on the floor around a stove; a wood fire was burning brightly within it; each maiden had her hands clasped about her knees; the twilight was beginning to gather, but the loose tongues, which had

been wagging for the last hour, betrayed no signs of weariness.

"I believe we are the happiest and merriest lot of 'N. Ts' in the South," observed Cornelia Jaynes, who was oftener called "Lee" or "Jaynesey." ("N. T." was the short for "nigger teacher,"—the epithet bestowed by the Southern whites upon the white men and women who taught in the schools for the colored people; and the girls, who were young, and for the most part pretty and gay, spoke of themselves as "N. Ts" with a wicked sort of delight.)

"I reckon we are the Maryest," replied Molly Cake, the younger and blacker of the "Cookies." "I am sure that we are the best looking," and rising to her feet, she surveyed herself in the 10x12 looking-glass that hung over the washstand. "Fair, fair with golden hair," and she patted her shining raven locks with mock dignity. "If ever I again am where I can survey my full four feet and six inches of maiden loveliness at one glance, I shall be enraptured. Only to think of the delight of seeing how my flounces hang, and if the length of my train is in proper keeping with the noble and philanthropic avocation in which I am now engaged. I suppose Mercy is wading through the Maine snowbanks about this time," she added, and turning about, the merry girl resumed her old place on the floor.

"She was the right one to go North," said Mary Walter. "She has a way of putting what she has to say, in a telling fashion. One sees at a glance there's no humbuggery about her, and if those Maine Yankees have any dollars to spare for anything, she will get them in her hands, for the 'Normal.'"

"There's a great deal of character in Mercy," added Zethrea Raynor, thoughtfully. "I shall not be surprised, if circumstances are favorable, to hear of her in the future as a foreign missionary, or something of that sort."

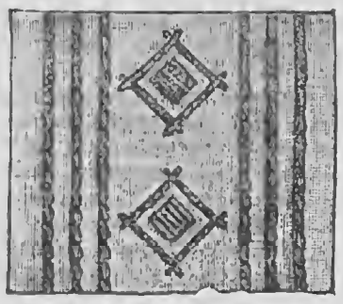
"Oh, I hope she'll be something better than that," shouted Mary Walter. "Anything but poking off to India or Japan to try and 'civilize a lot of people who are as happy as we are here, any day."

At this the girls glanced shyly at Mary Roswell, and Lee observed, with downcast eyes:

"I always expect something dreadful when Walter opens her mouth. She fairly keeps me in a tremble at the dinner-table, she speaks out so distinctly and free. I believe she's the only one of us who isn't afraid of the Hawleys."

"The Hawleys" were the family with whom the girls boarded, the man Hawley being a capable man, but beset with a weakness for retailing scandal; the woman Hawley had a sharp tongue and was an excellent illustration of a dowdy, both in general and in particular, so that between the pair, the "girls" had a fiery time. But they found consolation in forming a ring around their respective stoves in turn, every evening at twilight, and giving the Hawleys "particular fits."

"I am never afraid of people I despise," replied Mary Walter, tossing back her profusion of brown,



No. 5.

curling hair. "But I meant to cast no reflection on Mary Roswell, by my fling at foreign missionaries. Mary is a born missionary, whether at home or abroad. But Mercy's forte is not that, I think. She ought to fill a niche somewhere, where accuracy and executive power are needed. But I can't predict what her lot will be."

"Can you tell what mine will be?" asked Lee, with a blush and laugh.

"I'll prophecy that," chimed in Martha, the fair "Cookie." "Lee will marry that Presbyterian parson she corresponds with, and——"

"Oh, Martha!" cried Lee, "what a dreadful thing you are!" and her face blushed red and more red.

"Dreadful, perfectly dreadful," echoed Roswell. "Just see how Lee blushes!" And all the girls looked at "Jaynesey" and laughed in concert—a combined giggle that led her to cover her face with her hands.

"Oh my! what a sensitive plant!" said Mary Walter in a whisper. "I don't dare open my mouth now, for fear Lee will totally go off! Let's sing a hymn to revive her:

'Go tell Aunt Sally,
Go tell Aunt Sally,
Go tell Aunt Sally,
That her old gray goose is dead.'"

The girls, led by Molly Cake, sang the refrain with great effect.

"Now that we are all more cheerful in spirit," said Martha, "perhaps we can bear a prediction as to our own destinies. To begin with, I'd like to know what I am for-to-be."

"I can tell that!" cried her sister. "Martha is out out for a widower—a Methodist preacher with five children. She has a knack for living on nothing and making both ends of the year meet. Then she'd be first-rate in class-meeting—has such a pious face."

The sweet face of Martha was suffused with an amused expression, and she smilingly retorted:

"I shouldn't be at all surprised, girls, if that happened; I've had some stunning offers in that line. When a man with five motherless children, and a salary of five hundred dollars a year, with parsonage thrown in, makes you an offer of his heart, his hands," ("Twelve of 'em!" put in Mary Walter,) "and his fortune, why it sets one to thinking."

"I don't doubt it!" laughed Zethrea. "Now let's have a prediction as to the fate of Cookie junior."

"Let him be fair, with sandy hair,"

sang out the saucy brunette,

"Oh, perhaps we didn't propose any "him" about it," observed Roswell. "I predict that you will be a milliner."

"Pshaw! that's because I've trimmed all your winter hats," she retorted contemptuously.

"Really, sweet cake, I don't much believe you will ever marry," said Lee, seriously. "You are always poking fun at love and such things."

"Then I'm to subside into a milliner? Does no one else venture a prophecy? Does that one-armed captain who casts sheep's eyes me-ward signify nothing? Don't discourage me, girls, for I've always dreamed of a white satin dress and orange blossoms—black and white make such a lovely contrast!" and she concluded by holding her handkerchief up to her olive cheek.

"I don't think our predictions need annoy you much," observed Zethrea, in a tone of assurance. "I think you will all be married before I am. I never had a beau in my life."

"That's no sign," ejaculated Mary Walter. "I've had twenty or more, though heaven alone knows why."

"I shouldn't think a man would ever dare to ask you to marry him," said Lee, "unless he knew that you loved him with the real heaven-born marriage love!"

"Heaven-born marriage love!!!" repeated Molly, sotto voce. "Let's have another hymn:

'The one she's been saving,
The one she's been saving,
The one she's been saving,
To make a feather bed.'"

In this all the girls but Jaynesey and Roswell joined, concluding with a round of laughter.

Roswell seemed to have been taken with an "idea."

"What do you say, girls," she said, as the laughter subsided, "to a plan I have in mind. It is that, at the end of ten years, we each write the history of our ten years in the form of a letter and pass the letters around from one to the other. We will then see how many of our predictions came true."

"Nobody predicted on you, Roswell," said Martha. "You'll marry a missionary, I predict, and go back to the Sandwich Islands where you were born."

"I'll make a guess on Mary Walter, said Lee."

"Be very careful, Cornelia, for I might open my mouth," said Mary gravely.

"She will become a famous authoress," said Lee.

"Leave off the 'ess,' please. It is like being addressed as a 'female,' retorted Walter a little sharply. "But you needn't predict about me, girls. You'll not know how to address a letter that will reach me ten years from now, unless 'the spirits' shall have established a mode of communication between this and the unknown, that we have not heard of."

"Oh Mary Walter, you are so dreadful," iterated Lee, greatly shocked at Walter's irreverent tone, as it seemed to her. "I know you all think I'm silly and sentimental and of not much account," (Lee was greatly given to self-depreciation,) "but delicate people are quite as likely to live as anybody."

"You mean that people who are always going to die, never do die?" retorted Mary Walter, laughingly. "Well, I'm that sort, may be, but if I don't die, you may address me as Mary Walter, Spinster, the first of January, 1877. If I ever marry, it must be to a man who can withstand my sarcasm—and the chap that can do that will be greater than a Cæsar. He must have handsome hands and

ears, and the back of his neck be white and not red. He must never make love to me, nor yield to me an inch of his dignity—for then I should make game of him, like all the others—the simpletons that they are!"

"Oh, if ever you do fall in love, Walter," said Roswell, "I hope you'll have the disease bad. It would do you good, to fall in love, once."

"Then Roswell ought to be awful good," ejaculated Cookie, Jr., "for she's fallen into that pond enough times to be thoroughly soaked."

The tea-bell below stairs broke up the circle, and the girls arose, Roswell adding like a benediction, "Then we shall exchange autobiographies ten years hence?" and they all responded "Amen."

—[To be continued.

WEAKER THAN A WOMAN.

CHAPTER XXIII.

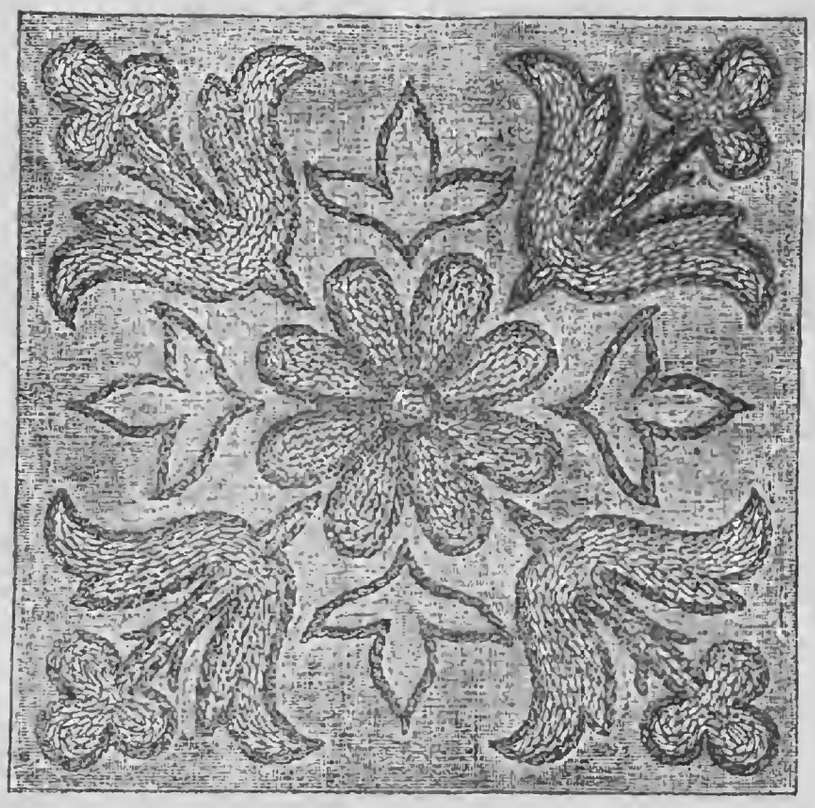
The girl Jennie delivered her message, and Violet quickly appeared at the gate of the Limes.

Before Felix had spoken to her, before he had touched her hand, the moment he had looked into her fair drooping face he knew that she was guilty. Something had gone from it that he was never to see again; something was there which was never more to leave it. She gazed at him and gave a little low cry; then, standing before him, she buried her face in her hands. He went up to her slowly; he took her hand from her face and raised it to his own. Then the lovely eyes closed; they could not meet his. He dropped her hands.

"You are guilty, Violet. Great Heaven, you have betrayed me! You meant what you wrote to-day."

There was something so quiet in his despair that Violet imagined his tone to be one almost of indifference, and the thought gave her courage; if he had shown any sign of great pain, she would have been frightened.

"I could not help it," she replied. "Do not be angry with me, Felix. I know it is the poorest of excuses—but it is true; I cannot help it. It was of no use going on in the same dreary way. It must have come to an end sometime."



No. 3.

"Let me quite understand," he said; "let me make no mistake this time. What have you done, Violet?"

"I have not done anything; but it seems better that we should part. No good can come of our engagement; it was a mistake."

He looked sadly at her.

"You say so, my darling, to whom I have given the best love of my heart—my life itself; you say that?"

"It is true, Felix," she replied; "and I am sorry. I shall never like any one as I have liked you, and you will never really care about any other woman as you have cared for me—I know it; but it cannot be helped."

He held up his head with such dignity, such passion of despair, that she was silenced. The false light words, the false light excuses, all withered into nothing, and she knew that she stood in the presence of a mighty sorrow, a mighty passion. All her little affectations, her miserable apologies, became as nothing before Felix's heart-rending distress and hopelessness.

"Violet," he said, "I can hardly believe that our meeting thus is real. I must be in a dream, from which I shall soon awake, and laugh to think that I believed in what was happening. It cannot be that I, Felix Lonsdale, have had to steal under the cover of darkness to meet you, my promised wife, and that you who have loved me, who have kissed me, who have looked on me as your future husband, are here to tell me that you are false to me. Stand still—so—and let me look into the face wherein I thought all happiness lay. Now tell me—is it true?"

He held her before him; she felt that his eyes were fixed on her—they seemed to burn to her very heart.

"You put things so strangely," she said. "I hardly know what answer to make to you. You are not fair to me. I have found that my engagement to marry you is not wise for either of us, and I tell you so. I see no heinous crime in that."

"You promised to love me, and me alone, until death—do you mean to keep that promise? No prevarication—speak truthfully—'Yes' or 'No'; do you mean to keep that promise? Speak, Violet."

But he had to bend low to hear her answer; it was a whispered "No."

"You promised to marry me, to be my wife, to spend your life with me and brighten mine; do you mean to keep that promise,? Speak—'Yes' or 'No.'"

"No," she whispered again.

"Will you tell me why you refuse, Violet."

Again she took courage at the seeming indifference of his tone.

"I cannot, Felix," she said; "you will find many another more suited to be your wife than I am."

"I do not want any one but you who have promised. What is there in the life I offer you that you dislike?"

"All of it, except—that I should like to be with you. I dislike the poverty, the obscurity, the want of rank and position. I am not so noble as you have always thought me, Felix. I love wealth and luxury, I love magnificence. I should never be content in the little home that you would give me—there would not be enough to fill my life. I felt that when I stood in it. I asked myself how I should live through the long years there. I should be miserable and you would be miserable too."

He looked at her in amazement.

"Would not love content you?" he asked.

The golden head drooped before him. She was ashamed of the words she had to speak.

"No, it would not content me," she replied "You deem me better, wiser, and nobler than I am. There are hundreds of good and noble women in the world, who ask only for love and are content with it. Seek one of those, Felix—they are worthier than I."

"Hush!" he cried again. "Do not say such words; many a man has taken the life of the woman he loved for less than that."

She shrank back from him with a pale scared face; he smiled one of the saddest and bitterest smiles she had ever seen on a human face.

"Have no fear, Violet; I spoke without reflection. You cannot think I meant to threaten you—you, every hair of whose head is dearer to me than my own life. Love would not content you, Violet?"

"No. I may as well tell you the truth. I was ignorant of many things when I promised to marry you. I did not know what riches meant—what luxury or magnificence was—what luxury or pleasure comprised."

"And you know now?" he said when she paused.

"Yes, I know now—and I cannot do without them. I would rather have had love with them; as I cannot have both, I choose them. You cannot call it a great sin, Felix, to change my mind when I did not know what my mind was."

"Violet," he said gravely, "do you know what even the world says of a woman who deliberately jilts her lover?"

"No," she replied.

"It says some hard things. It says that the woman who could be false to her plighted lover would be false to her husband and to Heaven; it says that such a woman brands herself 'liar' before the whole world—that she loses the claim to rank with women of honor. That is what the world says. Do you know what a higher power than the world says?"

"No," she answered him again

"That lying lips are an abomination. Where will you get this coveted wealth, Violet, even if you persist in refusing to keep your word to me?"

But she did not answer him; there were limits to what she dare do, and she dared not tell him that she was going to marry Sir Owen.

"You are very hard on me, Felix," she said.

"Nay, I am but telling you the truth—the solemn unvarnished truth. If you do give me up and marry even a title, never dream that you will have the respect or the esteem of your fellow-creatures; you would always be spoken of as the woman who jilted her true lover to marry a wealthier man."

But, in the pride of her youth and her beauty, in the pride of the future that seemed so brilliant to her, she would not believe that; she did not believe it, although she did not say so to him.

"Listen again, Violet," he continued in the same grave dispassionate voice. "You promised me, and I have lived on your promise; what is to become of me if you change your mind?"

"You will forget me soon, Felix," she said gently.

"Yes, dear—when the sun ceases to shine, when the tide neither ebbs nor flows, when flowers cease to bloom and birds to sing; but not until then, Violet—not until then, my sweet." His voice took all its old sweetness, his face its old light, as he drew nearer to her. "My darling," he said, "it was not your real self that was speaking. Your parents have persuaded you. They have told you that I cannot give you a home suited for you; but I can, my darling—I can. Only trust me. Violet, sweet, forget all they have advised, forget this wretched interview. Nothing so beautiful could be so false; nothing so fair could be so cruel. Let us forget it, my darling. I forgive it all, for I know it has been taught to you. Violet, let us bury the past wretched weeks. Let us begin again—you with renewed faith in me, I with my old love and old faith in you—faith and love which have never varied, and never will. Will you listen to me, Violet?"

"I cannot," she cried—and he felt the shudder that passed over her frame—"I cannot, Felix."

"Have you ceased to love me, Violet?" he asked quietly.

"No!" she cried. "Oh, do forgive me, Felix! I wish I had!"

"You still care for me?" he asked.

It seemed some relief to her to cry out that she did care for him—to lay her golden head on his breast, and moan out that she wished she were dead. His whole face brightened and changed as he heard the words.

"You still care for me, my darling," he said gently; "why, then, Violet, matters must come right in the end. This dark hour will pass, and happiness will dawn upon us."

So she lay sobbing near the noble heart she was breaking, while the wind wailed round them with a strange mournful sound.

Violet was the first to speak. She raised her lovely face all wet with tears.

"You do not understand, Felix," she said quietly. "I do love you—that makes my cowardice all the greater. I love you, but I can never marry you, because you cannot give me that which my soul loves best."

"But what if I do give it to you, Violet—what then?" he asked.

"You cannot; you must work hard all your life even for the moderate means that you will have. Do not talk any more about it. Felix, my resolution is fixed as are the stars in heaven; nothing can alter it, nothing can change it. We have made a mistake."

And for the first time during that interview it dawned across him that it was no girlish caprice he had to contend with, no idle whim, but the settled resolve of a woman in whose heart love took a secondary place.

Looking at her exquisite face, he asked himself, what if all this time he had been mistaken, if he had given this beautiful woman credit for a noble soul and a tender heart, while she had neither?

Such things had been; men had made even greater mistakes than that. What if she were worldly and selfish, false and pleasure-loving, even to the core of her heart?

"Violet, you puzzle me," he said. "Let me understand; you love me, you say?"

She sobbed out that she could not help it.

"You love me, yet you willfully break your promise to marry me. You send me away of your own free will, not because you do not love me, but because I have not money enough. Is that it, Violet?"

She did not deny it; it was the exact truth. He continued.—

"You love me, and I am what you call poor. You send me away, and a richer man comes. You will marry him because he is rich; you will marry him for his money while you love me. Violet Haye, do you know what the law of God calls such a sin? Do you think your weak subterfuge of calling this crime of yours 'changing your mind' will hold good when you are judged for your actions, and the just award is given to you?

He put her from him with a bitter cry—a cry that haunted her for long year.

"You have slain the best part of me; you have slain my love, my hope."

His despair frightened her; she drew nearer to him and tried to soothe him, but he would not let her hands touch him.

"You are not worth a man's thought, you are not worth a man's love," he cried, "you who have slain the truest of love. Do not touch me. It is such women as you who lure men on to death, who take a man's heart and crush it like a rose-leaf. No, do not touch me, Violet"—for she clung to him, weeping and crying out that he was too hard upon her—too hard.

"No, I am not hard," he said. "To my mind there is but one kind of love, and the soul of it truth. I do not understand such love as yours. Oh, Violet, once more let me appeal to you and warn you! Dear, you are all wrong—all wrong—and you will find it out too late. Believe me, Heaven has so made woman that to her the chief good is love—to her love is religion and life. Are you of a different nature that you can dispense with love?"

"It would not make me happy," she answered, in a low voice.

Her tears fell while she listened silently to words that haunted her for ever. His voice softened as he went on.

"You will not be young and beautiful always, Violet. The time must come when your hair will have lost its golden sheen and your eyes their light. What will wealth do for you then? If sickness comes to you, will all the wealth of the whole world purchase for you the tender touch of a loving hand or the tender words of a loving voice? You will lie, my darling, through long hours of pain thinking of me, longing for me, wondering how you could have been so mad as to send me from you, crying out my name, until you remember that to love me is a crime and that in my place you have the wealth you have chosen. Think of the long days when you will miss me. Ah, Violet, mind, lest in breaking my heart you break your own! I warn you that you cannot live without love; heed my warning before it is too late."

She made him no answer. He continued—

"I can see farther into the future than you, Violet, and with clearer eyes. I prophesy to you that the time will come when you will repent of what you are doing now, and be willing to give your whole soul to undo it. Will you heed my warning?"

Her heart went out to him in love and pity; but there was the picture before her of Garswood—the thought of the diamonds—of herself as Lady Chevenix.

"I cannot," she said.

He stood quite still for a few moments.

"You forsake me, then, for a richer lover—you give up my love for gold? Say, in plain words, that you do so; do not let there be a chance of mistake, Violet—do not let any false halo linger round your memory in the years to come. You give me up because I have not money enough."

"Yes," she replied; but the word came slowly and with great reluctance.

"I shall not regret you, Violet—you are not worth regret!" he said; but she cried out—

"Do not be so hard, Felix. I—I am weaker than a woman."

"You are indeed," he said, gravely. "Some women's weakness is half divine; yours is—well, I will give it no name; I know none that describes anything one-half so false."

"You are very hard, Felix."

He laughed aloud, and pleasure-loving Violet Haye wished never to hear such another laugh.

"I have no place here now, Violet. I will say farewell. My dear love, my lost love, farewell! Lay your sweet, cruel hands in mine once again—let me look into your sweet false face once more. Farewell, little white hands—you will caress me and slab me no more. Farewell, sweet eyes—you will look no more into mine. Farewell, golden head—you will never lie on my breast again—never again. Farewell! 'Beauty such as woman never wore,' heart most false, love most cruel—farewell!"

His voice died away in a low wail, and the next moment he was gone, and she stood there weeping for that which she could never recall.

"How cruel fate is!" she said. "I love Felix. Why could Felix not have Sir Owen's fortune? I almost wish that I had never seen Sir Owen. I did not think that I should care about Felix so much."

It was something new to the spoiled, petted beauty to feel pain—to weep without being comforted. She was unjust enough to think that Felix should have stayed to comfort her—should not have left her so wretched.

Then she realized that her faithful lover, so tender, so true, and so brave, had passed out of her life, and would be nothing to her for all time. She was impatient with her own misery—her own sorrow.

"If the time could come over again," she said, "I would not do it; I would marry Felix, let him be poor as he might."

But it was done; it was all over.

She was not very angry with pretty Jennie, but she warned her that her interview with Mr. Lonsdale must be kept a secret. She believed that Felix had bribed the girl—not that the girl had told Felix.

It was just as well, she thought, that the interview had taken place; there must have been a scene sometime or other. Now the matter was all settled, and she could go to London with a mind free from all anxiety. The grandeur awaiting her there must surely comfort her, for her heart ached for Felix—his burning, stinging words haunted her.

Who should dare say that on that white brow of hers was branded "liar"? Felix would be dreadfully distressed when he heard of her marriage. She knew that he would feel it most keenly; but then after a time he would forget it—no one would bear animosity against the young and charming Lady Chevenix. When she came back again, she and Felix would be friends. She would make overtures of friendship to him, and he would not decline them; he had always been so fond of her—poor Felix!

So she went away the next day to London, trying to forget the past and to think of the future. She did not care to remember that morning found her pillow wet with tears, for she had been dreaming of Felix.

CHAPTER XXIV.

Felix Lonsdale had tried his best; he had done hard battle with his sorrow—the sorrow that had come to him while the summer moon was shining and the corn stood ripe in the fields. He had done hard, fierce, terrible battle with it. It stood there ever by his side; no one had detected it yet—its presence was a secret from every one except himself. He was stunned, dazed, and bewildered by it; still he did brave battle with it. He looked at the invalid father, at the kindly mother, at the "army" of little ones; there was work to do, and he must do it. The home must be kept up, business attended to; money must be made, the home must not be neglected. Indulgence in sorrow was not a luxury for him.

He hardened himself, he hardened his heart; he said that there was neither mercy nor kindness nor love in the world.

Within a week after his farewell to Violet the handsome face had grown so haggard that it was hardly recognizable; the kindly eyes had a wild, weird expression, as though he were always suffering mortal pain—the ring had gone from his voice, from his laugh; he was an altered man. How he worked! He said to himself that work was the only thing which could keep him from going mad.

But it told upon him—no food, no sleep, no rest would he take—this constant warfare that kept every nerve strained. It seemed to him that if he once gave way, even if only for a moment—if he opened his heart to the dreadful sorrow waiting to be admitted—if he closed his eyes in rest—he must die. Colder and harder and prouder he grew, shutting himself and his sorrow in icy reserve; and at last Kate grew so miserable about him that she sent for Evelyn.

"I must [illegible] to you, Eve," she said, "or my heart will break. I do not like to distress my husband—he is ill enough; and, if Felix goes on like this much longer, he will have a terrible illness, or he will die. What is the matter with him, Eve? He does not eat or sleep; he looks like a man who has been stunned; he grows so hard and cold that I am almost afraid of him. He does not open his heart to me, he avoids me, he does not even look at me—he who used to love me so well. What is the matter with him, Eve?"

Eve looked very pale and sad, her sweet face was clouded; but Kate, in her distress, did not notice it.

"I can tell you what is the matter," she replied—"I heard it this afternoon. Violet Haye has gone to London to be married."

Kate cried out that it was impossible—that it could not be—Violet Haye was betrothed to Felix.

"It is so," said Eve—"aunt Jane told me about it this afternoon; and, fearing you would be in great trouble, I came to you at once. Violet broke off her engagement with Felix some short time since, and she is gone to London to be married."

"Married to whom?" cried Kate, in hot anger for her boy's sake.

"I do not know—she has so many admirers; but I believe it is some very rich man. Mrs. Haye is almost wild with excitement about it. She told my aunt the day before they started." And then, remembering how Felix loved Violet, they both wept together.

"I understand it all now," said Kate. "My poor boy has hidden it from us lest we should know what he suffered. Evelyn, does Heaven punish treachery?"

"I am afraid so," she replied, gently. "You say that Felix has grown hard and cold. Tell me where he is, that I may go and see him."

"He is at the office," replied Mrs. Lonsdale. "Do go to him, Eve. He was always fond of you—he always trusted you. Go and try if you can comfort him."

A light shadow of pain came over the sweet face—it passed in a minute.

"Yes," she said, thoughtfully, "he always trusted me. I will go and see what I can do for him."

Eve walked gently through the warm sunlit streets.

She went into the office without any announcement—she had done so since she was a child. Only Felix sat there, his pale, haggard face bent over his papers, a shadow like death in his eyes. He looked up in wonder at his visitor. Eve, with her sweet face, looked like an angel come to minister to him.

"Evelyn," he said, "you are an unexpected visitor."

She went round to him, and stood by the side of his chair.

"Felix," she said, "I know what has happened, and I am come to comfort you."

"Comfort! 'Comfort scorned of devils,' the poet sings. Eve," he laughed, "what comfort can you give me?"

She took the paper from his hands, and was startled on that warm day to find his fingers as cold as death. She held them in her own—her sweet eyes filled with tears.

"Felix, you must not harden your heart against me. You must not keep me outside it. We have been such true friends—such dear friends always. Do not be hard and cold and proud with me, dear friend."

"I will not, Eve," he returned gently. "Heaven bless you, Eve!"

"Listen to me a little while, Felix," she said—and her voice stole like a strain of sweetest music over his tired senses. "No man can know a greater sorrow than this sorrow of yours. The one you loved and trusted has deceived you. Violet has been false to you."

He shrank back with a cry at the sound of the words. She only clasped his hands the more tightly.

"Never mind the pain, Felix," she said. "It is right that you should accustom yourself to hear the words, and not shrink from them. Violet has proved false to you. I know how you loved her, and I know that the words cut you like a sharp knife; but, Felix, has there never been a mistaken love? Have you never heard of a man idealizing a woman, and worshipping in her virtues that she never possessed? The very fact that Violet could prove false to you proves also that she was unworthy of your love, that you thought her possessed of qualities quite foreign to her, and that she is not worth all this passion of regret."

"I loved her," was all he answered.

"I know, dear friend—I know"—and Evelyn's voice was sweet as the cooing of a dove—"and it is a terrible grief to you. Felix, because we are such dear and true friends, I am come to talk to you about this sorrow. There are three ways in which men meet sorrow. The weaker part of them fly at once to drink, to dissipation, to a reckless kind of despair; they have no nobility. You are above that. Others harden themselves; they shut out all love and sympathy from their hearts; they grow cold and proud, so that no kindly influence reaches them. Others—and, dear friend, believe me, these are the noble ones—accept sorrow as part of the discipline of life, as a gift sent from Heaven; and, while they accept it with humility, they bear it with dignity. It makes them nobler, grander, and better. It is an education that prepares them for Heaven. Which of the three classes will you join, Felix?"

"The last, if I can, Eve," he said slowly.

"Believe me, she went on earnestly, "we shall not know, until we come to die, what great sorrows do for us, and then we shall thank Heaven for them.

"A soul that has never suffered is but a puny soul, the strong and noble soul is the one that passes through the furnace of fire and comes out pure gold—not base metal or gold with an alloy—but pure refined true gold. The mystery is why men and women must all suffer; but that we shall never fathom; we only know that 'God sends pain—even to his best beloved He sends pain.'"

Something in the brave face and the brave patient voice touched him. He looked up at her suddenly.

"Surely, Eve," he said, "you have had no sorrow that you should speak in such a fashion?"

She smiled, and he thought how like her face was to that of pictured angels.

"Yes," she said, "I have a great sorrow; but it is dumb—it will never find a voice—it will die with me, and be buried in my grave."

"What has your sorrow done for you, Eve?" he asked, after a time.

"It has opened my heart," she replied, "it has killed all self-love, it has made me love and pity every one who has suffered, it has taught me that life is but short, and that heaven is my true home."

"It shall teach me the same, if you will help me, Eve. I loved her so dearly that my loss has almost killed me."

His pride and self-control gave way—he sobbed like a child.

"My dear old friend!" said Eve; and, as simply as a child might have done it, she drew his head upon her arm, and the first tears he shed over the great sorrow of his life fell on her kindly ministering hands.

RECENT LITERATURE.

Madeleine. By JULES SANDEAU. Philadelphia: T. B. Peterson & Bro. 50 cents.

THE character of Madeleine is a charming conception and the story of her life is prettily told. In the career of Maurice, the hero, we have an excellent illustration of the mental degradation to which an honest youth may come, who, reared in wealth and refinement, is sent forth to appease the youthful craving for change into the world, ignorant of its follies and the allurements of vice, and with no safeguard against them but the beneficent influence of a pure and refined home circle. As is too frequently the case, Maurice succumbs and, step by step, becomes a thoroughly selfish and depraved creature, until, ruined in property and station, he contemplates suicide as the only escape from dishonor. His rescue and gradual restoration to moral health by Madeleine, the simple country girl, is gracefully and naturally told. Unlike many of the novels we have from the French, there is nothing to offend the most delicate sensibilities throughout the story.

MAGAZINES.

HARPER'S MAGAZINE FOR JANUARY offers an unusual variety of interesting reading matter with over ninety illustrations. The number opens with an effectively illustrated paper on Liverpool entitled, England's Great Seaport. S. G. N. Benjamin contributes the first of the two profusely illustrated articles entitled, Rambles in the South of France. Besides these articles descriptive of places, there is for readers interested in the curiosities of animal life Mrs. Treat's illustrated paper, A Chapter on the History of Ants—a narrative of her own observations. Those interested in ceramic art will be especially pleased with Jennie J. Young's Cloisonne Enamel, with eight beautiful engravings. Agricultural readers will find Colonel Waring's illustrated paper on the last meeting of the Royal Agricultural Show, full of curious and instructive information. Porte Crayon contributes one of his characteristic articles entitled Home, with illustrations. A fine poem, The Great Harvest Year, by Edw. E. Hale, closes the number. The Easy Chair discusses Choate, the magazine of to-day, and the true story of Paul Revere's Ride, etc. The Literary Record is a survey of the important books of the month.

LIPPINCOTT'S MAGAZINE for January, beginning the new volume has a varied and attractive list of contents. There are three illustrated articles—Yorkshire Byways, by A. S. Gibbs; The Artists Island, by Dwight Benton; and Wild Boars and Boar Hunting, by Dr. G. Archie Stockwell. Miss Loffan, the author of that capital novel, The Honorable Miss Ferrard, contributes a striking story of Irish life entitled, Flitters, Tatters and the Counsellor, which is full of humor, pathos and incisive sketches of character and manners. A Young Girl's Experiences during the Two Sieges of Paris, gives a thrilling picture of the life of a Parisian family at the time of the Franco-Prussian war, and the fearful scenes enacted under the Commune. A series of stories under the general title of Women's Husbands, is begun in this number, and seems likely to pique curiosity by its fresh delineations of fashionable life. Edw. C. Bruce gives a graphic account of a Western Town. D. C. Macdonald describes A Trip to Newfoundland. Mrs. Hooper sketches the career of Madame Dubarry. Sidney Lanier gives us a Fairy Tale for Grown People. There are two striking poems in the number, The Poet's Protest, by Alfred H. Louis, and Christus! by Julia C. R. Dorr. Miss Olney's Through Winding Ways grows in interest, and the Monthly Gossip contains several papers deserving notice. The whole number is bright and readable from beginning to end. The publishers offer free to all new subscribers, in book-form, that portion of Through Winding Ways that has appeared previous to the issue of the January number.

ST. NICHOLAS for January opens with a long and beautiful poem, entitled The Voyage of the "Jettie," by John G. Whittier. Mrs. Dodge contributes a fairy-story, Wondering Toni, beautifully illustrated, and for the very little folks the same author gives a story of The Little Girl who Wanted to go to the Moon, illustrated with novel silhouettes. Chas. Dudley Warner asks the youngsters What shall We do with Her?—a tailless cat whose queer ways as he narrates them must keep her human neighbors in fits of laughter. F. H. Burnett, the author of That Lass o' Lowrie's, contributes a Christmas tale, Behind the White Brick. The long-promised fairy-story, by Julian Hawthorne, Rumpty Dudget's Tower, begins in this number, and the six pictures, by Alfred Fredericks, ably second its enchantments. Sarah J. Prichard tells How Wilster Elspeet's Ship went into the Church. There is a funny story, Pete's Christmas Tree, which describes the woes of a boy who wanted Christmas to come more than once a year. Christmas Day at St. Paul's, is a story which describes incidentally the anniversary of the charity school children in the great church of London. Two illustrated poems add much to the attractiveness of the number. The departments this month are extra good, and there is a capital acting play Ten Dollars, and a sweet little piece of music, A Nocturne for Little Hands. Susan Coolidge's new serial, Eyebright, will be begun in the February number.

News of the Week.

Monday, Jan. 6, 1879.

POLITICAL.

Owing to the recess of Congress there is little political news of interest, again, this week. The Potter Committee has been on a visit to New Orleans, mainly, 'tis said, to investigate a package of papers dropped in a store by the irrepressible Mrs. Jenks; but it was found that that astute lady had dropped the same package in streets and stores four times previously, on each of which occasions it had been returned to her unopened. It is supposed, therefore, that she wanted it picked up and investigated for some purpose of her own. The Teller Committee is about to start to the Crescent City, also, so that Louisiana matters are likely to be thoroughly ventilated. There is a great deal of interest taken in the nominations for Governor next year in Ohio, as the next Presidential election, it is supposed, will depend mainly on the condition of parties in that State. Gov. Talbot of Massachusetts has just sent to the Legislature the most energetic message delivered by any Governor in late years. He emphatically urges retrenchment in every department of the State Government, and as a first step in cutting down the extravagant salaries of officials, he advises a reduction in his own.

MISCELLANEOUS.

During the past week a cold wave of exceptional severity has swept from the northwest over the whole country from the Rocky Mountains to the Atlantic and from Canada to Mexico. News of consequent suffering and disaster load down the mails and keep the telegraphs busy in every direction. Trains have been blocked up in out-of-the way places, and their passengers half starved, and half frozen; cattle have perished by hundreds in exposed situations, and people by scores, not only in country places, but even in cities, upwards of half-a-dozen having been frozen to death during the week in this city and its environs; while tales of great suffering and many deaths are constantly coming from the prairies of the West. Numerous destructive and several fatal fires are also reported, while the weather prophets are loud in their predictions that this is only a foretaste of the intense cold we must endure in the next couple of months.

THE number of deaths in New York in 1878 was 27,005, against 26,203 in 1,877, and 1004 of them were caused by violence. There were 7·629 marriages and 25,729 births. The 90th anniversary of the founding of Cincinnati was celebrated last week under the auspices of the pioneer association. During the last eight years there has been an addition of 400,000 to the population of Texas. During that time the assessed valuation of property in the State has been increased $250,000,000. The oldest cow, probably, in New England was fatted and sold at Franklin recently. She was a Jersey, 28 years old, owned by E. L. Metcalf, had given birth to but one bull calf, and gave milk constantly without breeding during the last five years.

Lightning rod swindlers have been operating extensively during the fall and early winter in many parts of the country. They generally traveled in two gangs. The first induced many to have their houses rodded, payments to be made annually for ten years, during which the residences were insured against loss by lightning. Their followers always found that the sums agreed upon were too small, and in numerous cases the simple-minded farmers were bulldozed into signing notes for larger compensation. Over $1300 worth of these notes have now been sent to one bank in a small New England town for collection, while neighboring banks have received large amounts. This is only one of their forms of swindling; but they all have a close resemblance.

The Northern Pacific railroad which was the main cause of the collapse of Jay Cooke & Co., upwards of four years ago—an event which inaugurated the hard times that are now passing away—is to be at once pushed further west, a contract having been closed for its completion 100 miles more before the 1st of March. The price ($7100 a mile) is said to be the lowest at which any road has been built in this country or abroad, but the contractors are to be furnished with free transportation for their men and supplies over the completed part of the Northern Pacific line.

There will be a vigorous attack in Congress on the patent system after the recess, the farming enemies of the present system having secured many influential friends. The chief point which will be assailed is the right claimed by patentees, of collecting a royalty from the users of patented articles bought in good faith and once honestly paid for by private parties. The amount of shameful extortion and barefaced swindling practiced on the people, and especially on farmers, under cloak of this provision of the patent laws, has been so grievous as to imperatively demand some alteration in the laws for the protection of the community. Green's outrageous demands of royalty on Drive Wells are the immediate cause of the present congressional movement in the matter, and every farmer should at once bring all the pressure he can to bear on the member of Congress for his district, to induce him to give his support to some measure doing away with the present iniquitous proviso in this connection.

Cleveland summoned all nothern Ohio, and all the great men she could get hold of anywhere, to attend the dedication of her great viaduct last week—the biggest event in local history for years. The viaduct is indeed worthy to rank among the country's great public works, spanning the Cuyahoga river and valley, as it does, with 10 stone arches and an iron drawbridge, nearly two-thirds of a mile in united length, 64 feet wide and 70 feet above the river's low-water mark. It has been four years in building, at a cost of 2,170,000, including the right of way, and enables the East and West sides to see and meet eye to eye, across the vale where the rival cities of Ohio and Cleveland fought tooth and nail before their consolidations some 25 years ago. Texas expects to gain 15 representatives in Congress after the next census, but Senator Maxey says that 99 voters out of every hundred are opposed to a division of the State, their aspirations being to make of Texas a great commonwealth, bearing the same relation to the South that New York does to the East. New York influences are at work to induce members of the yellow fever commission against establishing a national quarantine. The commission now at the South find strong support for a system wholly under the control of the general government and which can be enforced in spite of the States. There are only eight States in the Union where the postal service pays its way, and half of them are in New England—New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania and Michigan—the net surplus of revenue from these States being over $2,530,000. If the remaining States did as well, the department would have a surplus of 10,000,000 to turn into the treasury annually, instead of lacking about $5,000,000 of being self-sustaining.

The receipts of wheat at the chief western centers are this year unprecedently large. The latest statistics show that at Milwaukee there is a very considerable increase over the two preceding years, while the receipts and manufacture of flour aggregate a larger amount his year than ever before. The live stock tables show an unprecedented increase in the business done, the receipts of live hogs being nearly double and those of cattle a third larger than last year. The receipts of cheese reached the enormous aggregate of 13,233,000 pounds., an increase of nearly 5,000,000 pounds over 1877. The receipts of wheat were 21,900,000 bushels. Flour, 2,263,000 barrels. The shipments of flour were 2,620,000 barrels. Chicago, St. Louis and Cleveland can show a proportionately large increase.

FOREIGN.

Across the Atlantic, the distress in Great Britain is still growing, and is reaching up from the laboring orders to the petty shop-keepers and the lower strata of what is called the middle class of society. Meanwhile all over the country wages are being reduced to starvation rates, producing grumbling and bitter discontent everywhere and strikes here and there. Another bank with several branches—that of Tweedie and Williams—has failed for $5,000,000 down in Cornwall, and though, as usual, it is said that it will be able to pay up in full, more than the customary amount of distrust and suffering has been produced by the failure. Out in Afghanistan things are not altogether so bright as previously reported. Shere Ali is on his way to St. Petersburg, to lay his case before Europe; his son Yakoob Khan has not surrendered to the British army, as stated in last week's telegrams. Of course, now that the Ameer's cause is not supported by Russia, its ruin is certain, but it may take several more months and many more lives to effect that ruin completely.

The people are dying of famine in northern Brazil so fast that coffins cannot be made for them, and they are thrown into ditches eight or ten at a time, and small-pox is still raging fearfully, the deaths in the province of Cerea alone numbering 500 or 600 a day. The government is doing much by sending the people into the country, etc. A thousand have been employed by the Collins brothers on the Mamore railroad.

A dispatch from Barcelona reports that the first cargo of American wheat ever received in that city arrived the middle of November, and great interest was excited. Samples were freely handled on Exchange, and it was immediately recognized as equal to Black Sea and Hungarian wheat. The cargo consisted of 72,000 bushels, and was sold for about $3.70 per 120 pounds. The cargo was brought in an English steamer. The freight amounted to $18,000, and the same steamer was again chartered to bring another cargo of wheat from New York. The American consul knows of a firm which has engaged three English steamers to bring three cargoes of American wheat to Barcelona, and it was thought about 25 cargoes would arrive during the season, all in English steamers. The consul reiterated his former opinions upon the great necessity of direct American communication with Spain and other countries bordering on the Mediterranean. With such communication, a new and important market could be opened. As it is now, we are indebted to the fact that British steamers find it profitable to take American wheat to Barcelona for this development of our trade. Fifteen cargoes of wheat from the Black Sea were afloat for Barcelona on the day on which this first cargo of American wheat arrived. The "Unicorn" line of steamers just inaugurated in connection with Vanderbilt's railroads, is intended to supply this deficiency. Some of the vessels will run between this city and all the chief European ports with which trade can be opened.

Statistics just given by Mr. Richard Hall, secretary to the meeting of cattle importers at Liverpool, show that there has been a very substantial growth in the cattle trade, especially in regard to importations from this country. The increase has been something enormous, and has occurred within a few months, instead of by slow accumulations. In 1875 only 702 cattle were imported, while in 1878, up to the commencement of December, the number was 50,000. The total for the year would probably reach 55,000, or, including sheep and pigs, not far short of 130,410 animals.

In France elections for the Senate were held yesterday, and have proved even more favorable to the republicans than their most sanguine hopes anticipated. A short time ago Gambetta predicted that yesterday would give the republicans twenty-five majority in the senate where they have hitherto been in a minority of at least twenty; but according to this morning's dispatches, their majority will be about fifty-seven. This will most likely insure the establishment of the Republic as the form of Government in that country after 1880. Its adherents already have a majority in the House of Representatives; McMahon has ceased his opposition to them; all the civic functionaries are of their party, or soon will be; the higher officers of the army have been mostly converted to their side, so that on the expiration of McMahon's term of office in 1880, they will be in an excellent position to defeat the hopes of the Imperialists and Monarchists. In Germany Bismarck's attack on free trade engrosses public interest; Socialist leaders are leaving the country, and another effort is being made to patch up a peace with the Vatican. In Spain Moncasi, the would-be regicide, was garotted, repentant, on New Year's Day.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

MEN, AND A CLEAN KITCHEN.

MARY WAGER-FISHER.

A WRITER in a late number of "Sunday Afternoon," an excellent Magazine, by the way—discovers a truth when she says, "Give a man a good dinner, and he will never know whether the windows and wood-work are clean or not—neither will he care two straws if they are not"—or something to that effect. She might have added that most men would rather live in dirt "up to their ears," than to have house-cleaning time come. I believe that men, as a class, love personal cleanliness as well as do women; that they like and appreciate a tidy table and well served meals; but that they are indifferent to a certain amount of dirt in and about a house, which is in fact not prejudicial to the health of the household. In this respect, they are superior to women in common sense, for no woman can keep her house in "spink-spank" order without making either a menial of herself, or paying for work done in which there is no positive profit. There is something truly delightful in entering a house where everything fairly bristles with cleanliness. But the charm is spoilt when one finds the mistress worn and weary from work and care, with a mind vapid and aimless so far as intellectual life is concerned, and too fatigued when evening comes to keep her eyes open as she reads, or listen to reading.

Four-fifths of the women who are housekeepers care more for what people may say about their housekeeping and the clothes they and their children wear, than they do about the world's opinion of the growth of grace in their hearts, or the culture of their minds. I heard a lady say not long ago, "Oh, I hate housekeeping! it consumes all my time in the everasting question of what shall we have for dinner. Life is *so* short that I want to get all out of it I can. I am jealous of every moment spent in looking after the vulgar needs of the body." She is a charming woman, a good wife and mother, an excellent housekeeper, but she has the vision to see that life holds things infinitely beyond polished windows, and stoves, that from their very blackness gleam like mirrors in the sun.

With all due respect for St. Paul in pronouncing cleanliness next to godliness, I believe extreme cleanliness, which requires the life-service of any human being, to be not merely next to sinfulness, but actually it. What I do indorse, is a sense of general wholesomeness in and about a house, clean cookery, clean dish cloths, a clean table-cloth and bright china and silver as essentials. That there are mud tracks on the floor, fly-specks on the window panes, dust on the top of picture frames, finger marks on the doors, or a carpet that has not had a thorough sweeping for a month—such things are of minor importance and ought to disturb the happiness of no woman who desires to use her time for better work. It is plain that a housekeeper must put a limit somewhere to her labors, or else give herself up to hopeless drudgery. What health and absolute comfort demand, should be carefully attended to; but beyond that, the work becomes, in a large part, unprofitable drudgery. It makes nobody better or happier—often the reverse—while the best that can be said of it is, that it gratifies in a way the small vanity of the woman who does it. She likes to see things look clean! So do all of us! And she is spurred on by some secret impulse to clean and polish, and sweep and brush, and scrub and scour, as if by such work eternal life were to be won. The force of habit finally becomes such that she can't lie down for a nap, and get a wink of sleep, if she knows that the mantel-piece has not been dusted, or that there is a bit of thread or a scrap of paper lying on the carpet. I doubt if any woman so hampered with a care for small things, can rise to a large and just conception of life, and understand in its true sense that life is more than meat, and body more than raiment. I believe in giving some good food to the mind every day of one's life, though the kitchen floor has not been scrubbed for a fortnight, or the parlor windows rubbed for a month.

Bryn Mawer, near Phila.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

BY ANNIE L. JACK.

INTO ALL LIVES DARK SHADOWS FALL.

"I AM so glad you wrote about your dull days," said a reader of the RURAL to me the other day, and when I asked why, she answered:

"Because it is very gratifying to find you *have* little trials; smoke and grumbling and *nerves*."

"Bless your heart, child!" I said—I like to be patronizing to people older and wiser than myself—"did you suppose because 'Pen Thoughts' show only the bright or the practical side of 'Every-Day House' there is no November in our lives? But then, like the article in question, we generally finish by going on with the cooking, or the mending, or some of the varied duties and lessons that are the regular work of every day. Yes! there are hours so sunless that we find fault with our dinner, even if we cook it ourselves, and if the baby indulges in like temper, a consequence of the lack of sunshine, we give the chubby fingers a smart tap sometimes, to recall him to a sense of the duty owing to society. And generally, in like manner, some little trial or deprivaiton, with its sharp tap, brings us back to a recollection of our duty and our blessings."

But I think there is no time of the year so dreary and so far upon what one may call the dark side of nature, as the month of November. "November," say the French, "is the month in which Englishmen hang themselves," and even in our fair, clear, Canadian skies, it was a month of remarkable gloom, and fog and rain. Yet, amid all the drizzle and mud, the Canadian heart was stirred to its lowest depth by the advent of Royalty itself. I have only read the papers afar off, but it seems to me the children of to-day may well believe that fairy stories are true after their knowledge of the brave young Highlandman who has brought among them the daughter of a Queen. Somehow one feels inclined to pity her, so far away from home, breaking off old friendships, and parting from such a mother. I feel as if amid all the applause there must be a sad heart beating beneath the velvet boddice of the Royal Emigrant. I noticed that the Horticultural Society abstained from an address, which doubtless was wisely done. The new Governor General will, I am sure, have the interest of the agriculture and horticulture of the Dominion at heart, without being utterly bored, as he must have been by the sometimes needless and fulsome addresses.

The Educational Association (an exclusive society, that has much need to imbibe fresh ideas from the Boston Study-at-Home Society), presented to the Princess Louise an address, and petitioned her to become its patroness. The latter part of her reply, which I here copy, is the reason why, in this department, I have alluded at all to the visit of Canada's new Governor General. This is the conclusion: "For it is from the meeting and mastering of difficulties that intellectual strength grows and increases, just as physical exercise develops physical strength. May I venture to suggest the importance of giving special attention to the subject of *Domestic Economy, which properly lies at the root of the highest life of every true woman.*"

DOMESTIC RECIPES.

Soft Hop Yeast and Bread.

TIE a handful of hops in a cloth and boil with six good-sized pared potatoes until the potatoes are well cooked; then drain off the water on to a pint of flour; take out the hops, mash the potatoes and mix them with the scalded flour. When this is cool stir in two good yeast cakes previously dissolved in warm water. When very light set away in the cellar or some cool place where it will not freeze, and it will keep good two weeks in the Summer and two months in Winter, when double this quantity might be made.

For the bread: Take one cup of yeast for three or four loaves, the usual quantity of warm water (or if convenient take half new milk) and as much water as can be easily stirred in; when it rises, salt, add more flour, knead well and make into loaves.

We use Clawson wheat and think the bread is better if kneaded but once.

If one has a warm place for the sponge it may be set over night; if not, it is best to set it in the morning as it will rise in half the usual time if this soft yeast is used. MRS. S. C.

Savannah, N. Y.

Polato Croquels.

In these days when in some localities the potatoes are not of good quality it is a very nice change to prepare them as follows: Boil, and mash while hot; add a piece of butter the size of an egg; a small teaspoonful of white powdered sugar, two well beaten eggs and the necessary salt. Beat well together and make into small egg or cone-shaped pieces. When cold, dip them into a mixture of raw egg and bread crumbs and drop for a minute or two into boiling lard.

Impure Rain-Water.

It is worthy of notice that two ounces of borax will clear a twenty-barrel cistern of rain-water that has become impure. In a few hours the sediment will settle and the water be quite clear for washing purposes. ANNIE L. JACK.

Plum Pudding.

For a pound pudding: One pound of brown sugar; one pound of suet; one pound of grated stale bread; one-fourth pound of flour; one and a half pound of currants; one pound of raisins; one-fourth pound of citron; seven eggs; one ounce each of allspice, ginger, cloves and mace—or use them to suit the taste; a table-spoonful of salt and a half pint of brandy. Mix with pure milk. Boil five or six hours.

EMMA S. KANE.

Brooklyn, N. Y.

Fried Liver.

Cut into thin slices and pour over boiling water turning it off at once. Have prepared some cracker or bread crumbs; dip in the slices of liver, sprinkle with pepper and salt and fry in hot beef drippings until both sides are of a dark brown.

Breakfast Dish.

Chop cold steak very fine; cook it in a very little water; add a few table-spoonfuls of cream, thicken, and season with butter, pepper and salt; pour over slices of nicely browned toast.

MARY B.

QUESTIONS ANSWERED.

Washing Fluid.

Mrs. J. A. Gregory, N. Y., says: "In the RURAL of Nov. 9th, there is a recipe for washing fluid. Is the soda-ash there given the same as sal-soda? It also says to soak the clothes in cold water over night. Does it mean with or without soap? I am interested in anything that will make washing easier."

ANS.—1. Yes. 2. Without soap.

Curing Beef Tongues.

J. G. McGuire, Tenn., says: "Will you please publish a recipe for curing beef tongues?"

ANS.—For a dozen tongues, make a brine strong enough to bear up an egg; add a pint of molasses and three or four red peppers; bring to the boiling point; skim and let cool; pack the tongues in a large jar, and when the brine is cold pour it over them; put on a weight to keep them under and let remain ten or twelve days; then take out, drain and hang to smoke for two or three days; dry moderately and put away in paper sacks.

When wanted for the table, boil five or six hours, or until tender: let cool in the liquor in which they were boiled; skin and serve in slices as thin as a wafer.

Mending Rubber Boots.

L. E. B., St. Jo Co., Mich., says: "I wish to know how to make a preparation with which to mend rubber boots and to fasten patches on to them?"

ANS.—The best cement we know of for that purpose is made by dissolving four ounces of pure India rubber and an eighth of an ounce of powdered asphaltum with five or six times the quantity of benzine. Put together in an old tin can, cover tightly, and let stand three or four days; then work it well with a stick, adding benzine if necessary, so that the mixture will be of about the consistency of honey. Scrape the polish from the rubber; apply the cement to each part; let dry half an hour; put on another coat; let dry ten minutes when the parts may be pressed together.

OUR FREE SEED DISTRIBUTION.

SEEDS of the following varieties of plants are offered to our subscribers without any charge whatever (except for postage, a part of which we bear) until further notice:

DEFIANCE WHEAT. A hybrid spring wheat. The most promising variety ever before offered.

"PEARL" OR "EGYPTIAN" MILLET. One of the most promising fodder plants known.

BEAUTY OF HEBRON POTATO. According to many careful tests, this is ten days earlier than Early Rose, as good in quality, and more prolific.

THE VOORHIS WATERMELON. A specialty of the Rural Farm.

GOLDEN RURAL TOMATO. A specialty of the Rural Grounds.

ACME TOMATO. This is offered as the best of the newer varieties of Tomatoes to those who may prefer it to a trial of the Golden Rural.

NEW BRONZE RICINUS. Specialty of the Rural Grounds. The most beautiful Ricinus in cultivation. A cross between Ricinus Gibsonii and R. sanguineus.

HIBISCUS MOSCHEUTOS—the showy and beautiful Rose Mallow, never before offered so far as we know. Hardy.

CALLICARPA AMERICANA (Purpurea). The brilliant French Mulberry. Hardy.

HIBISCUS SYRIACUS. One of the most charming of hardy shrubs. Sometimes called "Rose of Sharon." Our seeds are saved from double-flowering varieties—many of them from seedling plants. They grow readily from seeds, and bloom as soon as plants would if transplanted from nurseries. The seedlings "sport" without end.

WEIGELA. Seeds saved mostly from seedlings. This is probably the finest hardy shrub in cultivation.

DEUTZIA CRENATA fl. pl. Seeds saved from seedlings at the Rural Grounds. Seventy-five per cent. of seedlings will bear double flowers. It is perfectly hardy and there is no finer shrub known for ornamental grounds.

HIBISCUS MILITARIS. Hardy and beautiful.

ERYNGIUM LEAVENWORTHII. The most striking annual of recent introduction. (See RURAL of November 9th for engraving of this and other plants, seeds of which we offer.)

GERANIUM SANGUINEUM. A true geranium of great beauty. Perfectly hardy.

YUCCA FILAMENTOSA. Every farmer and lover of plants should have specimens of this perfectly hardy evergreen liliaceous plant in his grounds. It is superb.

VITIS HETEROPHYLLA. See RURAL, Nov. 9, for description of this hardy vine.

RURAL HYBRID AQUILEGIAS. Beautiful, hardy perennials of great beauty.

GRINDELIA SQUARROSA. See RURAL of Nov. 9 for remarks.

OBSERVE.

Any ten of the above require a one-cent postage stamp:—that is, ONE *cent* for the ten, not for each except the Beauty of Hebron Potato, Pearl Millet and Defiance Wheat. The Beauty of Hebron requires a two-cent extra stamp and the other two a two-cent extra stamp also.

Other varieties *may be* added. We intend this free seed distribution to be the most valuable of its kind that has ever been gratuitously offered by any journal, and to introduce the above valuable plants to the homes of farmers and horticulturists in every part of our country.

Throat Diseases often commence with a Cold, Cough, or unusual exertion of the voice. These incipient symptoms are allayed by the use of "*Brown's Bronchial Troches*," which if neglected often result in a chronic trouble of the Throat. **25c. a box.**

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 4, 1879.

THE holidays and extremely cold weather have tended to make quiet markets in nearly all cases. The trade expects a marked improvement for January sales, compared with the past dull December. Dairy products, poultry and vegetables seem to be up to buyers' limit in the price-view, and sellers will be contented if stocks of many items can be made to run down at current nominal rates. It seems likely that we shall depend very much upon home outlets, hence supplies have gone largely abroad, and as times in Europe do not indicate tree consumption, exporters will operate cautiously. Railroad supplies at the moment are moderate, owing to severe weather at the West and nearer, and that fact is favorable, as the market can start with a lighter movement when demands resume. Butter is freely offered, and some confidence is expressed for the best useful and higher grades. Cheese has proved a disappointing commodity this crop. There has seldom, if ever, been such a surplus of head stock. Poultry can hardly react in sellers' favor; it started low, and it is difficult to teach buyers new figures after easy terms have had any material length of establishment. We annex a comparative statement of some specials for the closed year and its predecessor:

Receipts of beans, 341,675 bu.; 1877, 350,328 do. Beeswax, 1,172 pkgs.; 1877, 1,257 do. Butter, 1,217,900 pkgs.; 1877, 1,269,750 do. Cheese, 3,172,800 boxes; 1877, 2,420,600 do. Dried fruit, 39,900 pkgs.; 1877, 58,000 do. Eggs, 465,800 bbls.; 1877, 474,725 do. Peanuts, 244,475 bu.; 1877, 278,150 do.

Exports of beans, 48,925 bbls.; 1877, 42,750 do. Beeswax, 151,850 lbs.; 1877, 128,425 do. Butter, equal to 230,300 firkins; 1877, 106,864 do. Cheese, 136,384,523 lbs.; 1877, 100,371,454 do. Dried apples, 20,036 bbls.; 1877, 37,300 do. Hay, 61,450 bales; 1877, 50,614 do. Potatoes, 149,850 bbls: 1877, 115,000 do. Onions, 11,318 bbls.; 1877, 11,233 do. Apples, 164,950 bu.; 1877, 108,250 do.

BEANS AND PEAS.—Medium and Marrow beans are far below the movement expected at this date of winter. Recently reduced rates are weak. Pea beans quiet; quality not fine enough. Kidneys with a moderate supply keep strong. Black beans in steady but not large demand. Green peas $1.20@1.35; Canadian field peas, 72@74c., in bulk and bond; Southern B. E. peas, 2-bush. bag, $2.00@2.70; prime, $1.47½@1 50; Medium beans, prime, $1 47½@1.50; fair to good, $1.50@1.40; Marrow, free on ship, $1.52@1.55; fair to good, $1.40@1.45; pea, $1.50@1.75; white kidney, $1.80@2.00; Ited do., $1,90@2.25; Black, $1.90@2.25.

Receipts of beans for week, 5,792 bushels; exports, 939 bbls.

BUTTER.—The run of trade for the past week can hardly be called a market. There has been no wholesale buying, and prices for the peddling trade are about as before. Fine parcels nominal. Western when properly salted and of uniform color holds its share of the market demand, and of other close buyers. Roll butter in better demand.

State, full dairies, special, 20c.; other, 18@19c.; firkin dairies, fair to prime, 13@18c.; Welsh dairies, fine full, 16½@17½c.; choice dairy, pails and half tubs, 22@23c.; fair to prime do., 18@21c.; choice Welsh, 19@20c. fair to prime, 13@17c. Choice creamery 26@28c.; other, 22@24c.; best western creamery, 27@28c.; other, 23@28c.; early packed creamery, 17@20c.; poor State 10@12c.; Western dairy, fine fresh, 16@18c.; fair to good, 10@14c.; factory, choice, 13@14c.; other, 8@12c.; rolls, 8@15c.

Receipts for week, 20,900 pkgs. Exports, 4,381 firkins.

COMPARATIVE RECEIPTS AND EXPORTS.

	Receipts, pkgs.	Exports, firk
June 1, '78, to Jan. 1, '79...	944,129	133,853
June 1, '77, to Jan. 1, '78...	803,939	136,136
June 1, '76, to Jan. 1, '77...	841,202	95,141

BEESWAX.—A light trade is in progress at 26@27c. for Western and Southern.

CHEESE.—This has been a very dull week and the situation as to prices essentially unchanged. The shipments have been 24,217 boxes, and part of these are through lots. Some special lots are held above quotations, but these are very scarce. Most of the stock is of a grade scarcely better than 8¼. Sales at: 8½@9c. for fancy; 8@8½c. for fine lots; 7¾@7¾c. for good; 4@5c. for skimmed. State, farm dairy at 8@8¼c. for fine; 7@7½c. for good to prime. Wisconsin factory, fine, 8¼@8½c.; some fancy lots to 9c.; do. good to prime, 7¾@8¼c. Western factory, fine and fancy 7¾@8¼c.; good and prime, 6@7c.; do. full skimmed, 2@5c.

Receipts for week, 11,371 boxes.

Liverpool cable 45s.

Comparative Receipts and Exports from June 1st.

	Receipts, boxs.	Exports, lbs.
June 1, '78 to Jan. 1, '79.....	2,687,165	105,042,228
June 1, '77 to Jan. 1, '78.....	2,150,510	89,160,618
June 1, '76 to Jan. 1, '77.....	1,855,318	73,426,279

Stocks of Cheese at principal points Jan. 1st, 1879, computed as follows:

	1879.	1878.
New York	306,467 boxs.	218,032 boxs.
Philadelphia	40,000	33,000
Boston	25,000	22,000
Liverpool	180,000	89,000
London	70,000	45,000

COTTON—Has been showing sharp fluctuations, as the advices from abroad were favorable or otherwise, with an active trading. Closing prices are for January, 9.50@9.51c; February, 9.64@9.65c.; March, 9.80@9.81c.; April, 9.93@9.94c.; May, 10.05@10.06c.; June, 10.16@10.17c.; July, 10.25@10.26c.; August, 10.31@10.32c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	N. Orleans.	Texas
Ordinary	7 9-16	7 11-16	7 11-16
Strict ordinary	8	8¼	8¼
Good ordinary	8⅛	8⅜	8⅜
Strict good do	8 13-16	8 15-16	8 15-16
Low middling	9 1-16	9 3-16	9 3-16
Strict low middling	9¼	9¾	9¾
Middling	9 7-16	9 9-16	9 9-16
Good middling	9 13-16	9 15-16	9 15-16
Strict good middling	10 3-16	10 5-16	10 5-16
Middling fair	10¾	11	11
Fair	11 11-16	11 11-16	11 13-16

DRIED FRUITS.—There has been but little done for several days, but an impression prevails that, with the new year fairly set in, business is likely to improve, and, in consequence, holders' views as to prices are fairly steady.

Southern plums at 13½@14c.; State plums, 15@15½c.; Blackberries are quoted at 5@5½c. Peaches—Peeled Georgia, at 6@7c. for poor; 8@9c. for fair to good; 10@10½c. for prime; choice North Carolina, 11½@12½c.; good do., 8@10c.; unpeeled halves, 3@3½c.; quarters, 3@3½c. Pitted cherries, 22c. Apples—Old State quarters, 2½@3c. New apples, 2@2½c. for southern quarters in bags.; 3½@4c. for good and prime sliced; do., fair at 3@3½c. State at 3½@4½c. for new sliced; and 3@3½c. for quarters; western at 2¾@3½c. for new quarters. Raspberries, 30c.

Exports, past week, 375 bbls. apples.

EGGS.—Supplies have run light and cold restrictive weather gives buyers some price-naming privilege. Demand, however, does not call for liberal receipts. Many Western arrive frozen and the actual supply small. Limited receipts of fresh have helped g od limned into use. Near points, doz., 30c.; State and Penn., 27@28c.; Western, fresh, 27@27½c.; Southern, 27@27½c.; Canadian, 23@24c.; poor 22@23c; selected limed, 19@20c.; good to prime, 18@19c.; poor, 15@17c.

Receipts for the week, 4,241 bbls.; do. last week, 3,987 do.

FLOUR.—The interruption to trade by the holidays, and as well by cold weather and the difficulty in moving supplies about the harbor gives but little to report this week; prices are on the whole rather easy.

The quotations are at $3@3.60 for very inferior to fancy superfine State; $3.60@3.90 for very poor to good extra do., odd lots and lines; $3 90@4.25 for good to very choice do., and fancy lots above this; $3.15@3.65 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $3.50@3.90 for very inferior to good shipping extra do. and $3.90@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.00@5.00; choice to fancy do. at $5.00@5.75; red and amber winter wheat, very inferior to very choice trade and family $3.90@5.60 round hoop Ohio at $3.85@4.25, and trade and family brands of do. at $4.25@5.60, the latter rate for very choice; St. Louis, $4.00@4.75 for very poor to good extra, and $4.75@5.00 for good to choice; Minnesota clear, very inferior to fancy, at $3.50@5.00; few brands going above $4.50; Minnesota "straight," inferior to fancy at $4.40@5.65; and patent fair to strictly fancy at $5.25@6.25, few brands going above $7.50; unsound stock at from $2.00@4.75; city mill extra at $4 65@5.00 for West Indies (the latter rate for fancy in new packages); do. for England $3.70@3.85; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.60 for fair to very choice; No. 2 at $2.30@3.90 for inferior to fancy.

FRESH FRUITS.—Apples are quiet as buyers will not risk the freezing temperature. Quotations not materially changed. Spits, choice, $1 75@2 25; common, $1 25@1 50; Baldwins, $1 37@1 87; Greenings and Spys, $1 25@1 62; inferior, 75c@$1; Lady apples dull, with the close of the holidays: choice, $5@6 bbl.; rough, 2@4 do. Cranberries show a moderate stock, prices tending higher for extra. Fancy Cape Cod, bbl., $9; fair to prime, $7@8 50; poor, $5@6 50; N. J., crates, fancy, $4; other, $2@3 25. Catawba grapes, nominally, 6@8 ¾c. Fla. oranges dull and weak, hf. bbl. cases, $1 75@4; bbls., 4@8. Pecans, Texas, 8@9c. per lb. Chestnuts out of date. Hickory nuts, shellbarks, $2 50@2 75; Va. hand-picked peanuts $1 10; other grades, 8@9c.; shelled, 4@5c.; demand fair.

Export of apples for week, 3,129 bbls.

HAY AND STRAW.—There have been but light deliveries here this week from the country, and although trade has been moderate, prices have been forced up a little.

Sales at 40@45c. for shipping, and 65@75c. for retail qualities. Straw quoted at 40@45c. for long rye, and 25@30c. for short rye, and oat at 40@45c.

Exports, for week, 335 bales.

HOPS.—Exporters have taken this week about 1 700 bales. This steady movement is almost entirely in the better grades, for which firmness prevails. Good and lower qualities are slow.

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 9@12; New Yorks, new crop, low to fair, 5@8; Eastern, 8@13; Western, 8@13; Yearlings, 4@6; Olds, all growths, 2@3; Pacific coast, 12@15.

OIL CAKE.—Western has sold at $28 per ton.

PROVISIONS.—Have towards the close felt the effect of the light receipts of hogs at the West and the falling off of the packing, consequent upon the severe storms; prices are higher and strong.

Mess pork quoted at $7.30@7.40 for spot lots of old; $7.12@7.25 for old for Jan.; $8.40@8.60 for new for do.; $7.20@7.35 for old for February; $8.40@8.60 for new for do.; $7.35@7.50 for old for March; $8.60@8.80 for new for do. Bacon at 4¼c. for long clear and 4¾c. for short clear. Lard at $5 87½ for spot lots; $5 85 for January; $5.87½ for February; $5.92½@5.95 for March. Stearine at 6¼. for prime. Tallow at 6¾ for prime. Beef Hams at $14.50@14.75. Beef at $10@1.50 for plain mess, and $10.50@11.50 for extra mess.

ESSENTIAL OILS.—First hand prices in N. Y. as follows: Peppermint in tin, $1 60; in glass, $2.30; sassafras, 44c.; wintergreen, $2.15; tansey, $2; wormwood, $3; pennyroyal, $1.25.

FEATHERS.—White live geese prime, 40@45c.

FURS AND SKINS.—The outlook is favorable, and prices are fairly firm.

Southern furs usually sell 15 to 20 per cent. below western.

GRAIN.—Wheat has tended lower and has been dull on tame foreign markets. Corn is also easy and slow. Oats have been well sustained on small receipts.

Latest sales of wheat are of No. 3 Milwaukee and Minnesota spring at 89c.; ungraded amber at $1.04½@1.08½; No. 2 amber at $1.05@1.05½; ungraded red at $1.03@1.08; No. 3 red $1.03; No. 2 red at $1.08½@1.08¾; No. 1 red at $1.09¾@1.09¾; ungraded white at $1.06@1.09; extra white at $1.11@1 11½; white State at $1.10; No. 1 white, in lots, at $1.09¾@1.09½; No. 2 white at $1.06¾@1.07; No. 2 amber, January option, at $1 05@1.05¼; do., February option, at 1.06¾; No. 2 red, Jan. option, at $1.08¾@1.08¾; do. Feb. option, $1.10. Corn, for steamer mixed, in lots, at 44½c.; New York No. 2 at 47¾@47½c.; New York No. 3 at 46c.; ungraded mixed at 45¾@47½c; new No. 2 white at 45½c.; New York steamer white at 45c.; round yellow quoted at 47@48c.; No. 2, January option, at 47¾@47¾c.; do. February option, at 45½@45¾c; new No 2, January, quoted at 45¾c. bid and 46c. asked; steamer mixed, January option, at 44¾@44¾c.; do. February option, at 44½c. Oats, for New York No. 1 at 31¾@31½c.; New York No. 2 at 30½c. offered and held at 31c.; New York No 3 white at 32¾@33c.; New York No. 3 quoted at 29@29½c. New York No. 3 white quoted at 31¾c.; white Western at 31@31c.; mixed do. at 29½@31c.; white State at 33@34½c.; mixed do at 31@31¾c.; No. 2 Chicago at 30c. asked and 29½c. bid for store lots, 31c. afloat; New York extra white quoted at 33@33½c.; New York No. 1 white at 34@34½c.; No. 2 Milwaukee at 30¼@31c. State 6-rowed barley, 83c.@$1; 2 do., 78@83c.; malt, $1.05@1.25, the higher price for Canada.

POULTRY AND GAME.—Live poultry slow, even with moderate supplies. Prices lower for chickens ducks and geese. Chickens, 6@7c., lb.; fowls, 6@8c. roosters, 4@4½c.; turkeys, toms, 6@7c.; hens, 8@9c ducks, choice, pair, 60@90c.; other, 45@55c.; N. J. geese, $1.50@1.62; other, 87c.@$1.37; pigeons, 25@30c.

Dressed poultry is dull, a good deal arrives frozen and unmarketable as the chief call is for choice light scalded or fine dry picked. Capons quoted 20@21c.; slips, 17@18c. Dry picked turkeys, 13@14c.; prime scalded, 10@12c.; fair, 8@9c. Chickens and fowls, dry picked, 13@15c.; common to good scalded, 7@8c. Ducks, choice, 12@13c.; other, 9@11c. Geese range, 6@10c. frozen stock, 4½@5½c.

Extremely cheap quail have rather absorbed the game demand. Venison no longer legitimately quotable. Birds of all kinds are plenty; prices easy. Hares and rabbits have declined. Quail, doz., 60@75c.; Grouse, trapped, pair, 70c; drawn, 50@60c.; Partridges, State, 70c.; other, 50@65c.; canvas-back Ducks, Havre de Grace, $2 pair; Western, $1.50@1.75; red head, 75c.@$1; Mallard, 50c.; Teal, 35@40c.; common, 25@35c.; Hares, 25c.; Rabbits, 17@20.

SEEDS.—Clover is in better demand Western quoted at 6½@7c., and State to 7¾c. for choice. Timothy at $1.25 for prime. Flaxseed quoted at $1.42½.

SUGAR.—Refined quoted at 9⅛@9¼ for cut loaf; 9¼ for crushed and powdered; 8⅝@8¾, for granulated; 7⅞@8⅜ for soft white and 6@7¾ for soft yellow.

TOBACCO.—The demand is light, but prices held generally steady, and not showing important change.

VEGETABLES.—Trade in potatoes restricted by cold weather. Choice qualities somewhat firm; common but useful easy; cabbages higher. Onions steady.

Nova Scotia E. Rose, bulk, $2.37@2.75 ₩ bbl.; Prolific and Chili red, $2.25@2.50; P. E. I. Jackson whites, $2@2.25; Mercers, $1.75@2; Eastern E. Rose, with bbl., $2.25@2.37; State, $2.50; fair to good, $2@2.37; do. Peach Blow, choice, $2.50@2.75; common, $2@2.25; Peerless, choice, $2.37@2.50; poor to good, $2@2.25. Sweet potatoes, Del., $2@2.25; Onions steady. White, $1.50@2.25; red and yellow, $1.50@2 Chester, $1.25@1.62. Hubbard and marrow squash, $1.75@2. Cabbage, $4.50@7 per 100. Cauliflower, bbl., $1.50@3. R. Turnips, 75@87c. Beets, 75c. Carrots, 75c@$1. Celery, 20@75c. doz. Extras; hot-house Radishes, $3 ₩ 100 bunches; Cucumbers, $2.50@3 doz.; Mushrooms, 40@50c. ₩.

Exports, potatoes, past week, 3,150 bbls.; onions, 225.

WOOL.—Firmness prevails and a moderate degree of activity; sales of X and XX Ohio fleeces at 34@35c.; combing and delaine at 36@38c.; Wisconsin fleeces at 32½; unwashed do., at 22½@26; Texas at 17@22 for fall, and 21@23 for spring. California at 21@24c. for spring.

LIVE STOCK MARKETS

Saturday, Jan. 4, 1878.

BEEVES.—Receipts for the week, 10,295 head do.; last week, 9,526 do. The week has not been a steady one in prices. At the close quotations were a shade better, poor to common steers, 7@8c., dress 54@55 lbs.; medium to good, 8¾@9½c.; 9¾@9¾c. for prime, dress 56@57 lbs.

COWS AND CALVES—The arrivals are small. Ordinary to good cows, $35@60; extras, $70@75. Market dull.

VEAL CALVES.—Live calves scarce, but the wants of the market are made up through receipts of hog-dressed. Choice N. J. and Buck's Co. live, 7c.; choice State, 7c.; other, including heavy, 5½@6¾c.; fed calves, 4@5. Hog-dressed, 6@9¾c.

SHEEP AND LAMBS.—Receipts for the week, 19,358 head; do. last week, 13,115 do. Sheep declined early in the week, and have since ruled dull and easy. Good to prime, 4@5c.; ewes, 3½@4c. Lambs steady at 5½@6½c.

SWINE.—Receipts for the week, 33,346 head; do., last week, 10,990 do. Market firm with seasonable weather. Fair, Ohio, $3.30@3.50 per 100 lbs.

Country dressed pork, N. J. light, 4¾@5c.; medium, 4¾@4¾c., heavy, 3¾@4c.; city, 4@4¾c.

Referring to new year projects the World says: "There is a rumor that the Baltimore and Ohio Railroad is soon to open independent stock yards; also, that the old yards at Weehawken will be reopened at the expiration of the present lease to the Jersey City Stock Yard Company. And along with these rumors floats the story that the hog slaughterers are becoming restless under a burdensome tax for needless accomodations in the way of yardage and gilt-edged corn, and contemplate the establishment of a union hog abattoir under their own control, somethlng after the fashion of the Butchers' Association abbatoir in East Forty-fifth street. Should all these things come to pass the traffic in live hogs here will slide out of the narrow rut which now makes it the next thing to a farce, and be once more a market where quotations of selling value will be something more than nominal.

The N.Y. World gives the following statistics:

RECEIPTS FOR THE YEAR.

Month.	Beeves.	Cows.	Calves.	Sheep.	Swine.
January	35,613	394	3,463	88,753	158,321
February	38,425	373	3,088	90,941	145,993

New Advertisements.

THIS NEW
ELASTIC TRUSS
Has a Pad differing from all others, is cup-shape, with Self-Adjusting Ball in center, adapts itself to all positions of the body, while the BALL in the cup PRESSES BACK the INTESTINES JUST AS A PERSON WOULD WITH THE FINGER. With light pressure the Hernia is held securely day and night, and a radical cure certain. It is easy, durable and cheap. Sent by mail. Circulars free.
Eggleston Truss Co., Chicago, Ill.,

HORSFORD'S
Bread
Preparation
UNSURPASSED FOR MAKING
LIGHT BREAD,
Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof. E. N. Horsford, by the Rumford Chemical Works, Providence, R. I.

Reading for the Young.

PYRAMIDS AND OTHER THINGS.

WELL, the festivities of Christmas and New Year are over; Santa Claus has, I trust, been very liberal in his gifts to all my nieces and nephews and satisfied all their wishes and expectations. Now, at the beginning of the New Year, let us start out with the determination to learn all we can both in school and at home, to employ every moment in some useful occupation, in fact, to do our very best in everything the whole year round; when New Year comes again we can then take some pleasure in looking back on the work we have done in the past year. I have received no answers as yet to the questions asked last week, but, of course, I shall soon hear from some of my clever relatives; meanwhile, I have concluded to tell you, in a very brief sketch, something about

THE PYRAMIDS OF EGYPT,

which, perhaps, all of you may have heard mentioned, but all of you may not know what they really are. Those who have studied geography know that in the northeastern part of Africa is a country called Egypt, which in very ancient times was noted for its prosperity and civilization; but its glory has declined long ago, and in our day it is of interest mainly for its history, for the peculiar river Nile, which flows through the country from north to south and empties into the Mediterranean Sea, and for the pyramids. I suppose that none, or at least but very few, of my nieces and nephews have studied geometry, and are therefore puzzled as to the meaning of the word pyramid. A pyramid is a solid body with a plane base and terminating in a point at the top.

The pyramids of Egypt are huge stone structures, situated on the left bank of the Nile, on the border between the great desert of Sahara and the fertile valley of the Nile. They were built about 5000 years ago by the kings that then ruled over Egypt. These kings had the peculiar belief, that after death, soul and body should again be united, and they live a second life on earth if their bodies could be preserved for 3000 years without decomposing, and it was for the protection of their corpses that the pyramids were built.

By referring to your maps of Egypt you can readily find the city of Cairo, and not far from this city are situated the three largest pyramids. The largest one of these was originally (I say originally, for owing to the destructive hand of time and man, it is now somewhat smaller) 484 feet high and 760 feet on each side at the foot of the structure, and covered an area of 577,600 square feet, or over thirteen acres. If you try to comprehend these numbers you will get some idea of this immense structure.

The outside was at first smooth, but now it is worn off so as to form great steps all the way from bottom to top. Inside are several passage-ways that lead to the chamber within where the body of the king was placed.

There are in all between sixty and seventy pyramids, each of which is supposed to have served as the tomb of a king, but now the chambers are all empty, and we have no record of what became of the bodies, whether or not the soul did come back, after the lapse of three thousand years, and claimed what formerly belonged to it; but as we do not believe in any such absurd superstition it is more reasonable to suppose that the tombs have been robbed by explorers and adventurers. From this brief description of the pyramids you will be able to understand what is meant if they are referred to, and I trust also that you will read all you can find on the subject in your books and papers, thus constantly enlarging your stock of knowlege.

UNCLE TRUE.

TALKS WITH THE CHILDREN.

JENNIE E. J. ALGER.

I SIT by a bright, coal fire, while the snow falls swiftly without. A chubby little boy in the next house is anxiously watching the storm with eager black eyes. There has not been snow enough to give him good sliding, and he wants to try his Christmas sled. Perhaps if this very small boy were in Lapland instead of Massachusetts, he would not like snow so well.

Did you ever hear of people using snow-banks for cradles? In Lapland, when fathers and mothers go to church, they roll the babies in fur and dump them into a snow-bank outside the church door, while they go inside and enjoy the service without being disturbed. Sometimes there will be thirty babies, all in a row. Don't you think that is rather a cool performance? I sometimes wonder if our customs seem as curious to people of other nations as theirs do to us. For instance, there lies before me a tiny shoe. It is exactly three and two-eighths inches long, about an inch broad at the heel, and runs to a fine point at the toe; yet it has been worn by a full-grown woman. This seems very strange to me, but I have seen them even smaller than this, and they are worn two inches and a half long.

Ah! Don't you pity the poor, little Chinese girls, who have to endure terrible torture in order to wear them? Do you ask why? For the same reason that some of you will be advised to wear corsets—because it is the fashion. Would you like to know just how this torture is carried on? You may suppose, as I used to, that it is commenced when the victim is a baby, and that the whole foot is compressed, and never allowed to grow, so that it all enters the shoe. But this is not the case. Rev. R. C. Houghton, in his books "Women of the Orient" says, that the binding of the foot is seldom, if ever, commenced before a child is five years old, and in most cases not until she is six or seven. This allows the limbs a good start and growth, and the poor, little girl learns how to walk firmly. There are women who make this their business, but sometimes the mothers take it in hand.

In the first place, all the toes excepting the great toe are folded down under the foot, the fleshy part of the heel is forced downward and forward, and a bandage (consisting of a strip of colored muslin four or five feet long and three inches wide) is wound back and forth in a figure of eight, over the folded toes, across the instep and around the heel, pressing that toward the great toe to shorten the foot. The bandage is wound snugly at first, and then tightened a little at each succeeding operation. This gradually throws the instep up and virtually breaks it, so that when the bandage is removed the front part of the foot may be moved like a door upon its hinges.

Under this treatment the foot soon becomes merely a mass of bones covered with tendons and skin. The growth above the foot is checked, and the leg tapers from the knee downward. "In the course of six or eight years, if daily attended to, the elongated bone of the heel, which is about all that is left of this part of the foot, is brought within a few inches of the great toe; the broken instep and folded toes are bound together with the ankle in an ugly bunch bulging outward above what seems to be the foot, and the great toe and the heel alone are thrust into the little embroidered shoe, and it is pronounced a perfect lady foot."

Oh, how ridiculous! If you were to examine this tiny shoe you would find a block of wood in the heel, making it about an inch higher than the rest of the sole. This makes the woman look as though she were walking upon her tiptoes, as she wriggles along, throwing out her arms to balance herself. Such ladies are obliged to use a cane, or rest their hand upon the shoulder of their attendants. The latter method is considered very genteel. They wear wide embroidered trousers, which conceal the bunch above the shoe, and one would suppose that their feet were small but well formed. It is almost impossible for a gentleman of another nation to secure the privilege of examining a foot thus deformed, but the Rev. Mr. Houghton, by the help of a lady who taught in a mission-school for girls, gained permission to look at a girl's foot; and, by the liberal use of money, when in Shanghai, he persuaded an elderly woman to remove the bandage from her foot, so that he is able to describe the process of "making a foot."

I wish to tell you more about this curious custom, but I fear it will make this talk too long, so I will wait until some other time, letting you have a chance to be thankful that you can trot about on your own, dear, free feet.

A TOO COMMON STORY.

HERE are two extracts from the local columns of recent New York journals which we commend to the notice of young lads who propose to enter commercial life.

A middle-aged, educated gentleman, cashier of the dock department, was arraigned for embezzlement of funds belonging to the city. He was, it appears, a man of refined tastes, with an especial fondness for flowers, which he indulged to the full extent of his own means.

He was tempted at last to indulge in unusual outlay in the importation of rare tulips and orchids, and began to "borrow" the money in small sums from the treasury. At the time of detection he had embezzled over fifteen thousand dollars, all of which had been expended in green-houses and plants.

The second case was that of a young man who came with high recommendations from the West, where he had always deservedly borne a good character, to New York, where he obtained a position in an established firm as book-keeper. A few months ago he was led into debt for some trifle, innocent enough in itself, a bit of bric-a-brac, or unwonted finery in dress. Other young fellows, he thought, could do it; why not he?

His creditors pressed for payment; the lad had but half the amount needed. Passing a gambling-house, it occurred to him that he could make it all right by a lucky throw. He went in, threw and lost.

The next day he too "borrowed" from the drawer a few dollars to try his luck again. He lost; borrowed again and again, until he had stolen two hundred dollars.

Then luck turned, and he won one hundred and eighty dollars. He staked it all and lost. The next day he was discovered, arrested, and is now in prison. For the indulgence of that petty whim, or bit of vanity, he has sacrificed character, position, and all hope for the future, and taken up the life of a felon.

There is a singular uniformity in the histories of almost all defaulters. They are not thieves by nature. They are tempted to some apparently innocent indulgence—what more harmless than flowers? They always mean only to "borrow" the money from their employer. They always are confident they will repay it, and the miserable, hackneyed tragedy always ends alike—in the prisoner's dock. Will our boy-readers heed the lesson?—Youth's Companion.

"A SLAVE'S DEVOTION."

THE late Judge Chambers, of Maryland, an intimate friend of Daniel Webster, was once travelling in Pennsylvania. It was years before our Civil War, and the judge was accompanied by his "body-servant," who was very strongly attached to his master.

While staying all night at a hotel in an inland town, the judge took from his pantaloons pocket his pocket-book, containing eleven hundred dollars, and slipped it under the pillow.

The next morning he was called at an early hour, that he might take the first train. Consulting his watch, he found that he must dress in a hurry, or he would be left. His haste caused him to forget his pocket-book, and it was not until the cars were conveying him swiftly from the town that he remembered where he had placed it.

When the conductor approached to collect the tickets, the judge searched his pockets, and then he became aware of his loss. He mentioned the circumstances to the conductor, and paid his fare out of other money he had with him.

The conductor gave assurances of the honesty of the attendants at the hotel, and said he would send a telegram to the proprietor from the next station.

The judge observed that he would send back his servant to recover the money, with instructions how to rejoin him.

The conductor was astonished that the master was both willing to trust his servant in a free State, away from his control, and to put into his possession eleven hundred dollars. The judge, however, had no anxiety about his servant, who, from the next station, took the first train back, secured the money, and rejoined his master according to instructions.

At the close of the anecdote, the judge said to me that he would have entrusted to that man's keeping every dollar he was worth, and that, too, without a thought of his abusing the trust.

Some persons in a higher position would not be injured by trying to apply to their own conduct the lesson taught in this narrative.—Youth's Companion.

THE EFFECT OF POLITENESS.

A BRAVE, active, intelligent terrier, belonging to a lady friend, one day discovered a monkey belonging to an itinerant organ-grinder, seated upon the bank within the grounds, and at once made a dash for him. The monkey, who was attired in jacket and hat, awaited the onset with such undisturbed tranquility that the dog halted within a few feet of him to reconnoitre. Both animals took a long, steady stare at each other, but the dog evidently was recovering from his surprise, and about to make a spring for the intruder. At this critical juncture the monkey, who had remained perfectly quiet hitherto, raised his paw and gracefully saluted by lifting his hat. The effect was magical; the dog's head and tail dropped, and he sneaked off and entered the house, refusing to leave it till he was satisfied that his polite but mysterious guest had departed. His whole demeanor showed that he felt the monkey was something "uncanny," and not to be meddled with.—Nature.

The Puzzler.

MISCELLANEOUS ENIGMA.

I AM composed of 75 letters:

My 49, 15, 27, 2, 7, 19, 8, 33, 47, 16 unlawful.
My 5, 6, 58, 10, 46, 4, 3, 48 a musical arrangement.
My 31, 13, 21, 58, 43, 9, 4, 49, 12, 27, 49, 18 the time of the year when a plant puts forth its leaves.
My 36, 25, 24, 30, 29, 35, 40, 71, 32, 22 an owner of land in fee-simple.
My 62, 75, 64, 11, 14, 39, 34, 55, 42 one addicted to adulation.
My 67, 1, 40, 75, 17, 8, 51, 4, 23, 61, 52 a mill [or] adventurer.
My 28, 33, 26, 37, 45, 63, 56 to that place.
My 44, 60, 70, 65, 6, 20, 72, 51, 53, 54, 49 pertaining to the healing art.
My 59, 57, 68, 69, 12 a tax.
My 73, 74, 50, 40, 19, 10, 3, 41, 27 transgression.
My whole is a text of Scripture.

☞ Answer in two weeks. LITTLE ONE.

FRACTIONAL PUZZLE.

ONE-FOURTH of vine, one-fourth of wine,
Then add one-fifth of chime;
One-fourth of load, one-fourth of load,
And now one-fifth of rhyme;
One-fourth of hung, one-fifth of young,
And then one-fifth of grind;
And one-third of you will bring to view
A writer of master mind.

☞ Answer in two weeks. NELL.

CHARADE.

My first belongs to every one,
What should we do without it;
My second is a common word,
Nothing new about it;
My whole we all would like to be,
For one I do not doubt it.

☞ Answer in two weeks. MARY WALEY.

CROSS PUZZLE.

1. PART of a house. 2. A piece of beef. 3. To cover. 4. Called loudly. 5. Candy. 6. An apathetic person. 7. Molasses. 8. A light. Centrals form a town of South Carolina.

☞ Answer in two weeks. BALTO.

CENTRAL PUZZLE.

1. A FRUIT. 2. A surgeon's instrument. 3. Danger. 4. Relating to one's birth. 5. A niggard. 6. A disease. 7. An animal. 8. A river of Europe. 9. A small pie. 10. Dust from burnt coal. Words of five letters, with centrals forming a city of Virginia.

☞ Answer in two weeks. DR.

DOUBLE ACROSTIC.

1. A city of Turkey in Asia. 2. A city of Turkey in Europe. 3. A city of United States of Columbia. 4. A city of Peru. 5. A town of Michigan. Initials and finals form two Grecian law-givers.

☞ Answer in two weeks. MD.

Sabbath Reading.

CAST THY BURDEN.

"Cast thy burden upon the Lord, and he will sustain thee."

AAST thou a care, whose pressure dread
Expels sweet comfort from thy bed?
To thy Redeemer take that care,
And change anxiety to prayer.

Hast thou a hope, with which thy heart
Would almost feel it death to part?
Entreat thy God that hope to crown,
Or, give thee strength to lay it down.

Hast thou a friend whose image dear
May prove an idol worshipped here?
Implore the Lord that naught may be
A *shadow* between heaven and thee.

What'er the care that breaks thy rest,
What'er the wish that swells thy breast,
Spread before God *that* wish *that* care,
And change anxiety to prayer.

RELIGIOUS NOMADS.

"WHAT shall we do with tramps?" is a question which is agitating society. The army of tramps is fast increasing. Tramps come to our houses by day asking old clothes or cold victuals. Tramps are found sleeping at night in barns, barrels and boxes. Tramps seek shelter from the cold in station-houses, stables and cellars. Tramps are found walking on the railroads, camping in the woods, and prowling along the highways. The women are afraid of tramps; the children run away from tramps; the men hate tramps. What shall we do with them? Some of the states have passed exterminating laws. In some cities the police are very vigilant and watchful. But the tramp nuisance continues.

Well, these are not the only tramps. We have a class of religious nomads who travel from church to church, as gypsy vagabonds travel from town to town. They are with one pastor as long as he shows them exclusive attention, and then become the adherents of another. They are in one sect awhile, and then try another, and at last drift into some sort of come-outerism. The prevalent modes of evangelism are calculated to produce a race of religious tramps. Men and women are taken from their religious firesides and their altars of worship to crowd into some large hall, where a colossal choir and various kinds of attraction hold excited throngs. When the work is over, the "tramp business" is brisk, and the nomadic wanderers are found everywhere. Each great revival of this sort needs three of another kind to follow it to save the things it scattered, and gather up the things it threw about in confusion. And if you say a word on this, you are charged with not being in favor of revivals. Your resistance is greeted with an impugnment of motives. The time is not far away when the churches will awake to the evils of any system that produces a race of religious tramps, that breaks up the established church life, that forms nomadic habits among Christians. And all this the modern system does most effectually.

READING HYMNS.

A correspondent of The Standard has the following to say of the custom of reading hymns before singing is generally practiced by the clergy and has often seemed to me to be in exceeding bad taste and disrespectful to the congregation. No doubt many will deem such a statement a rude one, and a reflection upon the clergy not warranted by the fact in the case and unwarranted warfare upon a time-honored custom. Well, let us see.

What was the origin of the custom of reading hymns before singing? Simply this: no books in the hands of the congregation or singers, and inability of the masses to read the hymns if supplied with books. In a large majority of our congregations, the causes which originated the custom no longer exist.

If a pastor desires his congregation to read with him the Scriptures in concert, he does not read over the chapter first and then ask the congregation to read it with him. If he should the inference would be that he had serious doubts of the ability of his congregation to read. Now, is there any essential difference between that and reading a hymn all through and then asking the assembly to repeat it in song?

But every good rule has its exceptions, and these may be occasions where it would be advisable to read a stanza or two and possibly the whole hymn. The preacher may know that the choir or leader of the congregational singing may need a few moments for preparation, and in such a case it might be the pleasantest way of passing a painful silence to repeat a stanza or two of the hymn. Again, if the preacher knows himself to be an extraordinarily good reader of poetry, it is kind in him to give his audience frequent specimens of his ability and accomplishments in that direction. Under all other circumstances, with intelligent congregations there is no further use for perpetuating the old custom of reading in extenso, hymns before singing. Who will second my motion for abolition?

Such souls as have once been in the arms of God, in the midst of all oppositions, are as men made all of fire, walking in stubble; they consume and overcome all hindrances: all difficulties are but as whetstones to their fortitude. The moon will run her course, though the dogs bark at her; so will all those choice souls who have found warmth under Christ's wings run their Christian race in spite of all difficulties and dangers.

WE should rather make easy channels for the water of life, than desire to raise land-floods from our broken cisterns.—[Bergelius.

NEVER venture on any action, unless you bring God to it; nor rest satisfied, unless you carry God from it.—[Quarles.

PERSONAL ITEMS.

George Washington is to be hanged in Kentucky in February, and Jeff Davis in South Carolina in April.

Duke d'Audiffret Pasquier has been elected a member of the French academy, to fill the place of the late Archbishop Dupanloup.

Bessie Turner played in "A Celebrated Case" at the Indianapolis opera house Christmas eve, and Theodore Tilton occupied one of the boxes.

Lord O'Hagan, late Lord Chancellor of Ireland, who has inherited through his wife the large Townley estates in Lancashire, was once a reporter.

The new Queen of Burmah is said to be practically a believer in women's rights—at least she takes a warm interest in the conduct of affairs. The King, after the custom of his fathers, married his own half-sister.

Peter McNamara, a well-known citizen of Washington, died this week from the bite of a man named Donaher, received two months since in an altercation. The bite was on the finger, which was subsequently amputated, but the poison had spread to the arm and could not be arrested.

Mr. Spurgeon continues to be a martyr to rheumatism and unable to resume his pastoral duties. "I cannot," he says "stand for even five minutes. During the night I have been fiercely attacked by rheumatism in the back and loins, and I now feel quite prostrate. How I long to speak again in the name of the Lord!"

It is related that not many months ago William Cullen Bryant and Bayard Taylor were sitting together in a Fourth avenue car in this city. The two poets became somewhat loud in a conversation about the physical and mental health of John Greenleaf Whittier. They were fearful lest Mr. Whittier's death should at an early day deprive them of a fellow-writer. And now he alone survives.

Mr. Young writes of Castelar, the famous Spanish statesman: "He is still a young man. He has a large dome-like head, with an arching brow that recalls in its outline the brow of Shakespeare. He is under the average hight, and his face has no covering but a thick, drooping moustache. You note the Andalusian type, swarthy, mobile and glowing eyes that seem to burn with the sun of the Mediterranean."

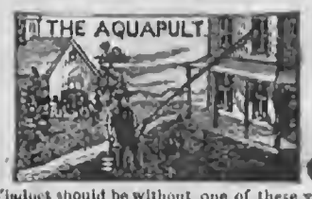
Mr. Haars, the American consul at Alexandria, Egypt, has just gone round the world in a rapid fashion, unequated even by Jules Verne. He accomplished the journey in 68 days. It took him 20 days to go from Alexandria to San Francisco, by Brindisi, Paris, Liverpool and New York; 20 days also to go from San Francisco to Yokohama; 6 days thereafter he reached Hong Kong; in 10 days he set foot on shore at Ceylon, and 12 days later he found himself again in Egypt.

William Wacherle says that he is alive and his wife says that he is dead. There is a paid-up insurance policy of $7,000 on his life, which fact is supposed to influence Mrs. Wacherle's course. Wacherle used to live in Carver, Minn., where he was a foreman in a machine shop. His wife induced him to get into life insurance, and he soon got the idea that she was in a hurry for him to die, so he left Carver, and wandered about the country for many years. Recently he returned to his old home, and learned that his wife had accumulated alleged evidence of his death. She refuses to admit his identity, and demands the $7,000.

They have a Methuselah in Baltimore, one William Scott, familiarly known as "Uncle Billy," a colored man who is claimed to have lived 149 years. A citizen has made affidavit that he has known "Uncle Billy" for fifty years; that William then bore the same appearance as now; that the deponent's father, who had been nursed by William, gave the date of the latter's birth 1729. "Uncle Billy" might pass for a man of seventy. He has had six "head" of children—that is, six different families of children, exactly how many he doesn't remember. He was a body servant to Lord Howe during the Revolution, went to England with him, and was servant to an English officer at the battle of Waterloo.

A Berlin paper has an amusing story about Beaconsfield. When orders were sent to secure rooms for him at the Kaiserhoff Hotel, it was specially directed that his sleeping chamber should have two beds. This caused much surprise, as it was known he was a widower, and there had never been an imputation on his private character. The general impression was, that, being in delicate health, he might have desired his faithful secretary, Montagu Corry, to sleep in his room. The waiters and chambermaids grinned, and set themselves to watch the British plenipotentiary when he arrived in Berlin, and took possession of his two-bedded chamber. They found he went to it all alone, and in the morning came out of it all alone, moving with bent head and the under lip pursed out as usual. Then began betting as to which of the beds the illustrious man had occupied. A chambermaid stole in, and came out with an astonished face. "Both!" It seems that the weather was very hot, and when the Premier felt himself uncomfortable from heat in one bed, he moved to the refreshing coolness of the other, with better hance of good sleep.

Implements and Machinery.

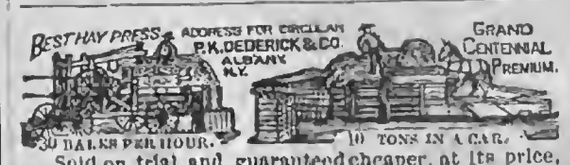


"THE AQUAPULT," a new and greatly improved Fire-Extinguisher, Garden Engine, Window and Carriage Washer, Tree, Vine, and Shrub Protector from insects, etc., for starting Aqueducts, and various uses which readily suggest themselves. No Dwelling, Factory, Railroad Station or Wooden Railroad Bridge or Viaduct should be without one of these valuable articles. Weight, with hose, 5 lbs.; throws water 60 feet. Price, $9.00 each, sent by express, C.O.D. Manufactured by W. & B. DOUGLAS, Middletown, Ct., the oldest and most extensive manufacturers of Pumps in the world. Branch Warehouses, 65 and 67 John St., New York; 197 Lake St., Chicago, Ill.

Implements and Machinery.

RICHMOND CITY MILL WORKS,
RICHMOND, IND.
Manufacturers of
MILL STONES
and
Flouring Mill Machinery.
Corn and Feed Mills a specialty

The most complete Mill Furnishing establishment in the country.
Special estimates and price-lists furnished on application.
State you saw this in RURAL N.-Y.



Sold on trial and guaranteed cheaper, at its price, than any other Hay press as a gift or no sale. Don't be swindled by irresponsible manufacturers of infringing machines, as the purchaser is liable. It costs no more for a good press than an inferior or worthless one.
Address, P. K. DEDERICK & CO., Albany, N. Y

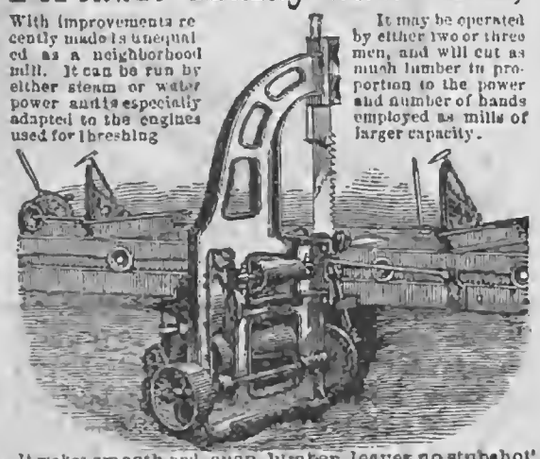
Implements and Machinery.

THE
Perfect Milk Pail.

Preserves Milk from specks and lumps of **dirt** and **dung**, and from the **atmosphere** of the stable, which gives the so-called **animal odors.** A seat for the milker; holds 14 qts.; cannot be slopped in nor kicked over by the cow; the milk is strained before entering it. If your desire purer, more wholesome and fragrant milk, cream and butter than ever before, send $2.00 for a pail, or get circulars and induce the storekeeper to order a dozen. Address
DAIRY SUPPLY CO.,
P. O. Box 416. 15 Murray St., New York.

Portable Mulay Saw Mill,



With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power and is especially adapted to the engines used for threshing. It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.
It makes smooth and even lumber, leaves no stub shot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, prices, etc., to CHANDLER & TAYLOR, Indianapolis, Ind.

ESTABLISHED 1844.

Wit and Humor.

A YOUNG man with his first goatee may be said to have a tuft time of it,

GARLIC is said to be a sovereign remedy for gout. There is no remedy for garlic.

A JOCKEY calls his horses Kerosene and Petroleum, because they are a paraffine steeds.

WHEN the Sultan loses his temper, the ladies of the household speak of him as a harem-scare-'em fellow.

THERE is a very suggestive proverb which declares that "There are a great many asses with short ears."

IF a woman were to change her sex, why could she no longer be a Christian?—Because she would be a he(a)then.

HOOD, in describing the meeting of a man and a lion, said: "The man ran off with all his might, and the lion with all his mane."

A ROMANTIC young man says that a young woman's heart is like the moon—it changes continually, but always has a man in it.

THE young man who wrote and asked his girl to accept a "bucket" of flowers became a little pale when she said she wooden ware it.

LITTLE boy at the opening of a proposed spelling-match—"Let's start fair, grandmother. You take 'Nebuchadnezzar' and I'll take 'cat.'"

WIFE OF HIS BUZZUM. "Was that the kiss of dooty or kiss of affection, Mr. Bodger?" Mr. Bodger. "I decline to answer that question."

A CHICOPEE, Mass., small boy declined to eat soup at dinner the other day, on the ground that he hadn't any teeth that were little enough for soup."

THE class in German grammer is on the subject of genders. "Miss Flora, why is 'moon' masculine in German?" "So that she can go out alone nights, I suppose."

"DID you do nothing to resuscitate the body?" was recently asked of a witness at a coroner's inquest. "Yes, sir; we searched the pockets," was the reply.

THE latest waltz is called "The Wave." It is very pleasant to watch the buoys bobbing up and down to the music of the dance.—*New York Commercial Advertiser.*

THE laugh has gone around at the expense of a State Street, Boston, young man, because he was overheard to say that he wished he had the "facilities for a curtain lecture."

A COURTLY negro recently sent a reply to an invitation, in which he "regretted that circumstances repugnant to the acquiescence would prevent his acceptance to the invite."

A LITTLE boy, weeping most piteously, was interrupted by some unusual occurrence. He hushed his cries for a moment, the thought was broken, "Ma," said he, resuming his sniffle, "what was I crying about just now?"

"YES," said a young lady, who was possessed of a fine voice, "I am often asked to appear in public, but—" "But what?" observed a friend. "Well," she replied, "I should never be able to sustain my party. I am so easily decomposed."

"AREN'T you rather too old to ride for half price?" said a ticket clerk to the elder of two boys. "Well," remarked the youth, "I am under fourteen, and this boy with me is under six. That don't make twenty, and you will take two boys under ten for half each." And he took them.

THE graceful curvilinear 8 is mustered out, old and crippled, and sent to the asylum of superannuated years; and the blunderbuss is handed to the brave new recruit, the topheavy 9, with the bulgy forehead and the inadequate underpinning. "Halt and give the countersign!"—*New York Graphic.*

As an old colored man and his son stopped in front of an umbrella store, the son saw some umbrellas with covers on them, and questioned his father: "What's de covers on them dar um'rellas for?" "Why, chile, dem's put ober de um'rellas to keep 'em dry when it rains," was the father's response.

THE Hard-headed Breed.—Sympathizing bystander about an unfortunate man who has been knocked down and stunned by the train. "Poor man! Take him to the station," Injured one (recovering). "Tyek me to the station? What for, then? If aw've dune ony harm to y'or enginn, aw's willin' to pay for't."

A PAIR of scissors was lost, and the little one suggested that a prayer be said, asking that they might be found. There was, however, a lurking consciousness that there ought to be a combination of prayer and work, so the youthful philosopher said: "Now, Mother, I'm tired; so I'll pray while you hunt."

IT is not true that Bertha Von Hillern has paralysis of the l—. Now, before we complete the word let us reflect. If we go on and say "—egs," some awfully particular folks will stop their subscriptions, and if we say "—imbs" the other crowd will accuse us of mock modesty. Guess we won't finish the sentence. Anyhow, she hasn't got paralysis.

PRODUCER. MIDDLEMAN. CONSUMER.

"WHO was it rang, Bridget?" "It was a man, ma'am." "What was his name?" "I doan know, ma'am He axed fer yer husban', ma'am, and he is not got home." "What kind of a looking man was he?" "Sure, ma'am, he was a—he was red-headed, an' tall, an' he had a—a predicament in his spache, ma'am!"

SHE wept, the poor laundress, on returning five shirts, where her patron had entrusted her with six, and confessed that she had burned a big hole in the sixth while ironing. "Never mind," says, kindly, her enstomer; "Christmas comes but once a year, and that 'll be all right. How much do I owe you?" "Six shirts at 12½ cents each—75 cents." "But, I say, you burned one of 'em up." "Well, suppose I did. Had n't I washed it before I burned it? Go along wid ye; trying to chate a poor dissolute widow."—*New York World.*

Our Tenure of Life

Depends in great measure upon our regard for or neglect of the laws of health. If we violate them we cannot expect to "make old bones." But that the span of existence allotted to a naturally delicate constitution, or one which has been shaken by disease may be materially lengthened, is a fact of which we have daily proof. The vivifying and restorative influence of Hostetter's Stomach Bitters upon a failing physique affords a striking illustration of the power of judicious medication to strengthen the hold on life. Restored digestion, complete assimilation, renewed appetite, sound repose, these are among the benefits conferred upon the debilitated by that supreme renovant. With a circulation enriched, a frame invigorated, and a nervous system tranquilized, the invalid, after a course of the Bitters, feels that his life-tenure is no longer the precarious thing that it was—that he may yet enjoy a "green old age."

Farm Topics.

LIGHTS AND SHADOWS ON ENGLISH FARMS.

PROFESSOR I. P. ROBERTS.

Superfluous trees and hedges; small, irregular fields; English and American farm laborers contrasted; excellent tilth the secret of England's large crops; good tillage versus commercial fertilizers.

LEAVING the fertile, well-tilled farm of Mr. J. J. Mechi, free from obstructing trees, hedges and ditches, and passing northward into Suffolk County, one is forcibly reminded at every turn in the road, of the justice of his criticisms on English agriculture.

The first thing that pleases yet annoys the American—especially if he be from the prairies—is the great number of spreading Oaks scattered through the fields, and the numerous and too often unkept hedges. That the Oaks are beautiful no one can deny; neither can it be denied that they obstruct the plow, occupy four times the ground that should under any circumstances be allowed trees so situated, and then are of comparatively little value. The Oak is the ideal of a lawn shade-tree, but is far too low and brushy for timber. So, a neatly-kept live fence in its appropriate place, is a "thing of beauty and a joy forever," but a double line of half-dead and unkept thorn-trees, inclosing often less than three acres, makes one exclaim, "Why cumbereth it the ground?" when England imports nearly two bushels of wheat for every one grown on her own soil.

From actual count it is found that, in some parishes, the fields average only four acres; in others, five and a half, six and a half, eleven, eight, thirteen, respectively. In 120 parishes 4,683 fields were found to be either triangular or of some other irregular and inconvenient shape. To fence a section of land—640 acres—into ten-acre, square fields requires 5,760 rods of fence, and to fence it into four-acre fields would require about 3,000 additional rods. If we estimate it at $1.00 per rod, we find the cost is $13.68 per acre. Add to this the cost of repairs, deterioration of material, interest on investment, and rent of the land occupied, and the total forms a sum that is not only appalling, but ruinous. It is no wonder that so shrewd a man as Mr. Mechi should, on purchasing his first little farm of 128 acres, removed three and a half miles of fence. If those who farm the lands owned them, there would be some hope that at least a part of these worse than useless trees and fences would be removed; but with the lands in the hands of the wealthy few, who too often think more of the "shooting" than of their tenants, all progress in this direction is slow.

In another direction very great improvement has been made—the laborers' earth-floored hovels of fifty years ago, not fit for swine, have largely given way to small, neat and comfortable brick cottages, and so far as I can learn, the farm laborer is now, as a rule, not only comfortably housed but well fed. But the English farm laborer and the American are quite different persons. The former seldom is able or expects to acquire either land or wealth, and is therefore apparently contented with his lot, anxious only to serve acceptably that he may retain his position. The latter, who is very often some young man born poor but with full faith in his ability to become possessed at no distant day of broad acres, is restless and ready for almost any change that offers a short road to success. In one thing they are alike—both seek their own good, the latter by change, the former by permanency. The one is unduly stimulated by those around him who have risen from obscurity to honor; the other lacks even a healthy incentive to make the most of his surroundings. The one is too rapid and nervous, the other too slow and plodding. The one is perfectly willing to do a big day's work, if you will let him do it in eight hours and go to the village after supper; the other will work faithfully twelve or fourteen hours, but must have plenty of time to eat and drink and is greatly averse to haste.

If I was disappointed in seeing so many more trees out of place, so many more open ditches, so many more broad-based and unkept hedges than I had expected, I was also greatly pleased and instructed by the fine tilth of the fields, and the magnificent crops of grain. Why is it that England so far exceeds us in the average yield of wheat, oats and barley? I began to ask questions:

"What insects are the most destructive to grain?"

"There has been none for many years in this locality that has done much damage."

"How often does the wheat winter-kill?"

"Scarcely ever, if sowed early and in good condition. The yield is sometimes slightly reduced by "laying," rainy weather, mildew or rust."

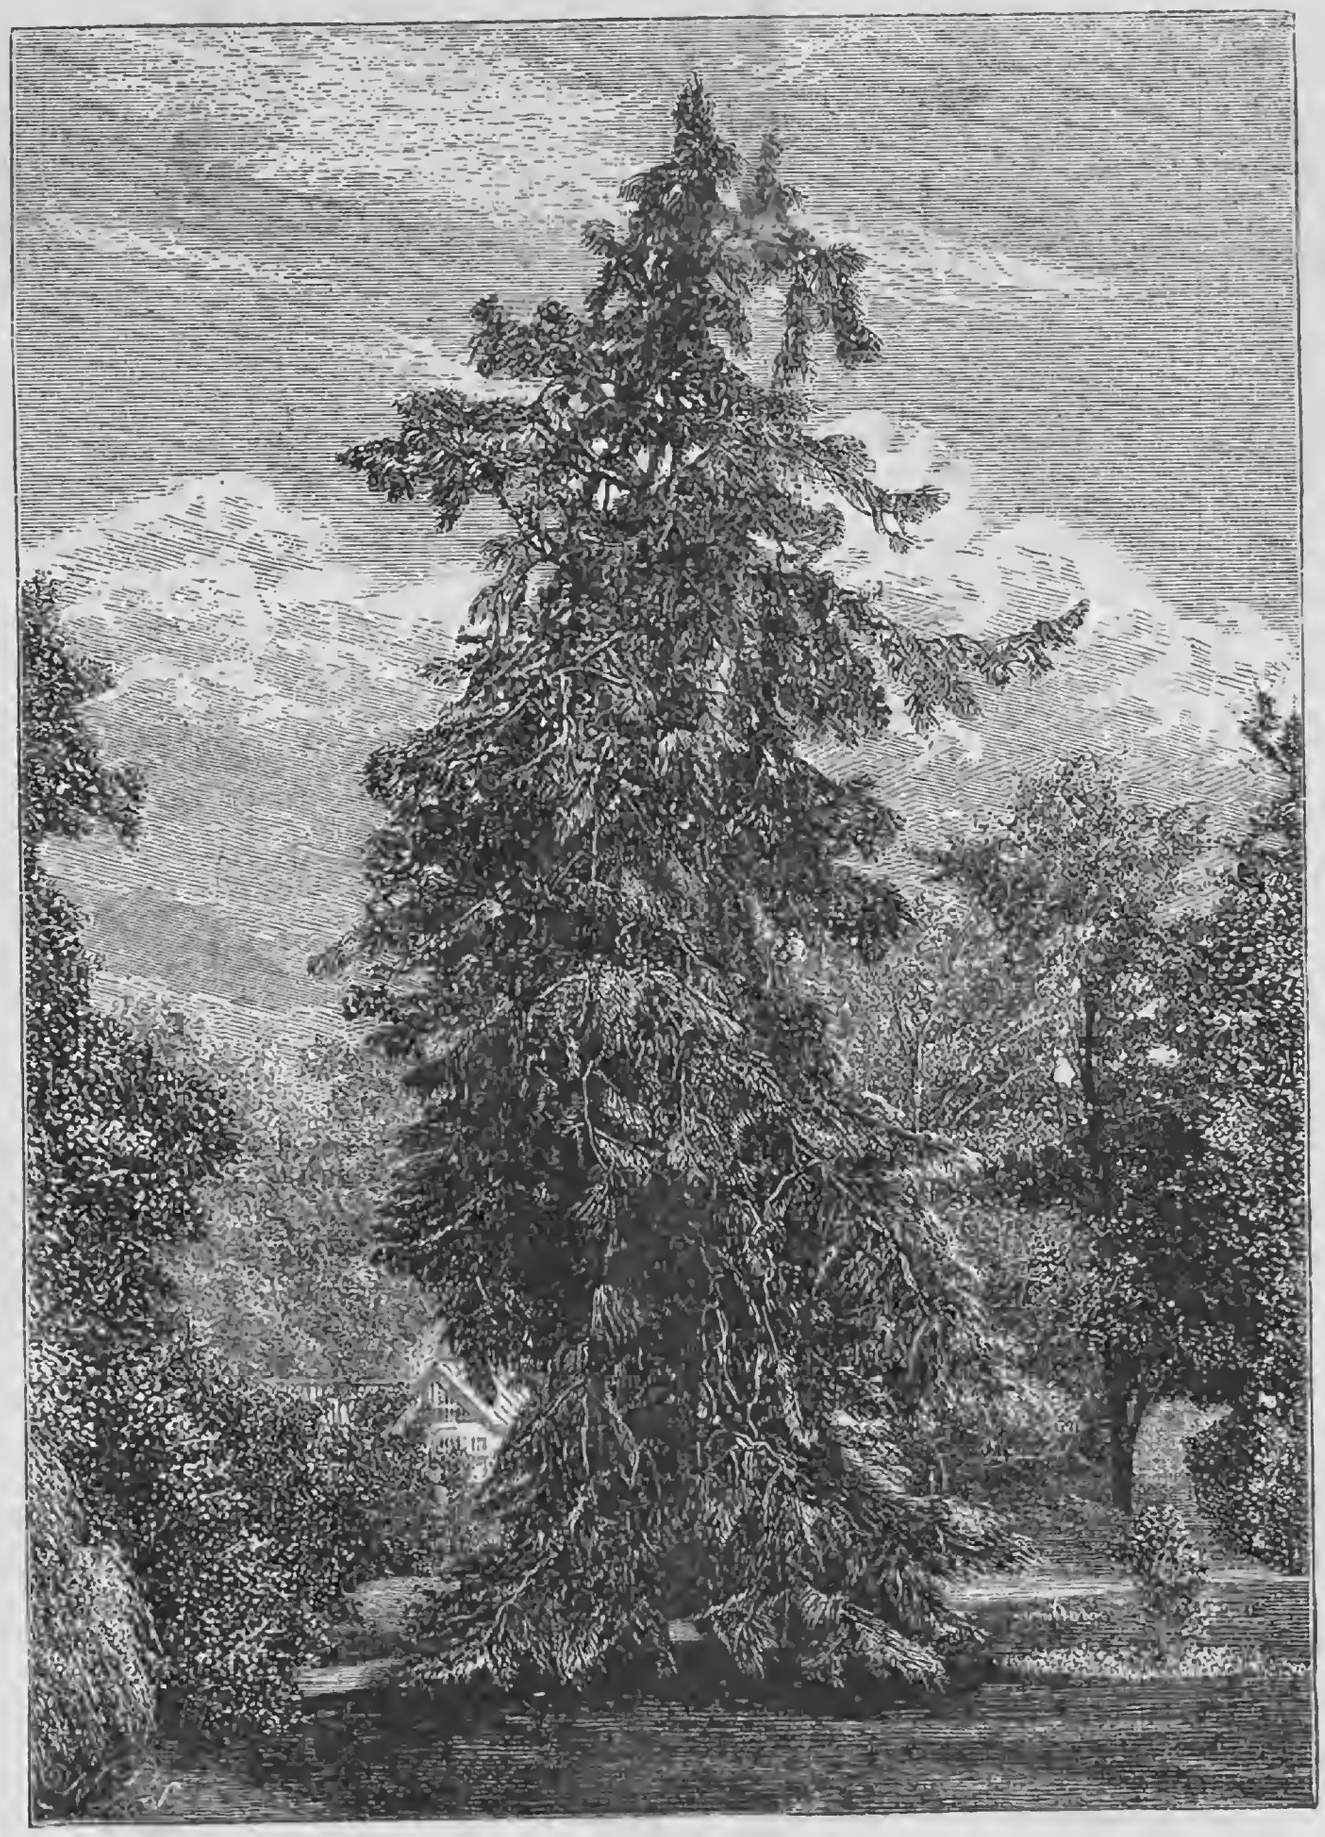
On looking around, I found that there were at least ten good farmers to one poor one, while in the United States the reverse is too often true. It is often said that the English farmer is forced to farm well to meet his high rents. Then, might it not be said that the American farmer is forced to farm well to get any profit on his low-priced products? While I felt that I had found some of the reasons for their high averages, I was not thoroughly satisfied, and on further inquiry, learned that while the question of fertilizers was a great one, the question of the preparation of the soil was a greater

The English are noted for their straight furrows, and we consequently infer that their plowing is superior; and so it is, in one sense The ground is all plowed; it is all alike, and looks beautiful; but still it is not well pulverized, because the mold-boards of their plows lack the requisite boldness and twist to perform the work in the best possible manner. The short, stubby, American plow holds harder and requires more skill to preserve a furrow of even width, but it is a better pulverizer; so the American farmer has come to think that the preparation of the soil is about complete when it is plowed: while the English fully understands that the real work is then only begun. Herein, I am satisfied, lies the secret of England's success in raising larger crops. It would take away the breath of a prairie farmer to hear even an Englishman's enumeration of the "spuddings," the "grubbings," the "twitchings," the harrowings, the cross-harrowings, the rollings and crushings that a heavy clay field is subjected to before it is considered ready for wheat.

What is this all for? Simply to unlock the full store-house of nature. That it is full has been proven time and again. By actual analysis it is found that an average soil contains, in the first six inches, plant food enough for from fifty to one hundred and fifty full crops of grain. I do not desire to discourage the purchase and use of fertilizers, but what I do protest against is, purchasing on time commercial manures at forty dollars per ton, which are really worth only twenty-five, to enrich cloddy fields already fairly rich in plant food locked up, it is true, but there, none the less, only awaiting a little judicious application of brain and muscle to set it free.

If these hastily jotted facts and impressions are the means of inducing my fellow-farmers to remove some of the useless trees and fences, or to give the fields an additional cross-harrowing or two before casting in the seed and asking the Lord to bless the labor of their hands, my object will have been attained.

Agricultural Dept, Cornell University.



PINUS PONDEROSA VAR. PENDULA. (See p. 39.)

AGRICULTURAL EXPERIMENTS.

PRACTICAL experiments in farming are essential to progressive agriculture, and yet how few farmers will take the trouble to make experiments and note carefully the results for their own and others' benefit! There are a few praiseworthy exceptions, but the great majority are entirely too indifferent in this respect. Agriculture will never attain the high degree of perfection it might, and which its importance demands, until the common farmers become more deeply interested in their calling, or "profession," and learn to work with their heads as well as with their hands. The term "professional farmers" sounds odd, and is unfamiliar, but they are just the kind of farmers needed to bring the great agricultural interest up out of old-time ruts, and place it on the highway to success. Statesmen, lawyers, physicians, etc., carefully note precedents and experiments in their respective professions, and profit thereby, and why should not "professional farmers" also learn wisdom from the past and reap some benefit from the study, experience, and labor of their brother farmers?

The Department of Agriculture is trying to bring about an improvement in this matter by distributing new seeds and improved varieties of old ones, and requesting cultivators to make minute special reports of their experiments with them. But few of those who might do this, however, can be prevailed upon to do so, as the majority of far-

mers are too busy throughout the summer season to spend much time in experimenting, and gardeners have the most of their grounds otherwise occupied, so that they have little room to spare for that purpose. Some few, however, do make careful experiments, and through this means many valuable improvements in products have been established in different parts of the country.

Among the many good features of the RURAL NEW-YORKER is its specialty in publishing valuable practical experiments that have been made on its own Experimental Farm and Grounds, and elsewhere also. General principles are applicable alike to all things of the same nature, but in farming the diversity of soil, climate, exposure and surroundings, requires careful consideration and study, and what may be suitable for one place might not do well in another. The field for study and improvement is therefore large and varied, and the exercise of one's best judgment is requisite to the successful tilling of the soil in the different parts of the country.

As statistical correspondent of the Department of Agriculture for Ogle county, for the past seven years, I have had considerable experience in experimental farming, and know whereof I speak. Some of the seeds received from the Department have proven satisfactory, and have been propagated from year to year, while others have failed to do well, or sometimes even to germinate. Among the most successful of those received within the past year, I will mention the

SILVER CHAFF WINTER WHEAT.

Last summer, I received eight quarts of this wheat. It was accompanied with the following "pedigree," or history: "This wheat comes from York county, Province of Ontario, Canada, where it has been successfully grown for two years. It is a distinct variety of winter wheat, withstands the severest frosts, and is not liable to disease or rust. Its average weight is sixty two pounds to the measured bushel."

I gave the eight quarts of seed to one of my neighbors, who sowed it, September 24, 1877, on twenty-six square rods, being at the rate of about a bushel and a half of seed to the acre. It was sown broadcast on rolling prairie soil—a black, rich loam—nearly level, but facing the south, well drained naturally, plowed a medium depth, not sub-soiled, and harrowed well after sowing. No fertilizers were applied, and the seed was not "prepared" in any way, but sown as received. It escaped winter-killing, but was injured somewhat by storms and hot weather a few days before harvesting, and was also slightly rusted. It sustained no injury from insects; was harvested July 9, 1878, when fully ripe, and yielded, when thrashed, 317 pounds, being at the rate of about 32½ bushels per acre, mostly good quality, though some grains were shrunken. The average weight was about sixty-three pounds to the measured bushel. The straw was strong and tall, some stalks measuring six feet with heads six inches in length. The straw of the crop was not weighed. The wheat produced was all sown this fall and before snow covered it, It had a promising appearance. I think this is an improved variety of hardy, smooth winter wheat.

BEAUTY OF HEBRON POTATOES.

On April 27, 1878, we planted five quarts of these potatos, cut to 250 pieces of one to two eyes each, in a row in the garden, planting the pieces about six inches apart. The soil was rich but had never been fertilized with anything but stable manure. The foliage was luxuriant and the blossoms profuse. They commenced blooming June 18. About 85 or 90 days elapsed from the time of planting till the decay of the foliage, but on this point I cannot speak definitely. On August 29, we dug nearly five bushels by measure from the five quarts of seed planted. After having been kept one week in a shed to dry, a few rotted, and the remainder weighed four bushels, or 240 lbs. They are now stored in the cellar and are keeping well. Their intrinsic merits for table use are about the same as those of the Early Rose as near as I can judge. W. B. DERRICK.

Ogle County, Illinois.

[We have not claimed they were SUPERIOR in *quality* to Early Rose—but earlier by ten days and more prolific and even in size.—EDS.]

THE HISTORY OF A POOR FARM.
No. 2.

HOW TO DRAIN A SWAMP.

"THE Doctor says ammonia is the most necessary thing required in the growth of crops," said my old neighbor, who had called to see how the work on the swamp was progressing.

"If he had said that ammonia is one of the most necessary elements of plant food, he would certainly have been correct, or at least nearly correct," I replied. "It is not at all certain that ammonia is needed at all directly, and only indirectly as a source of nitric acid, which it is more than probable is the shape in which nitrogen is taken up by plants. We say the sun rises and sets when, in reality, it is stationary, and it is we who are carried to and from it; so we think and talk of ammonia in connection with plants and manures, because we can recognize it easily by its strong and well-known odor and other properties, and so we never think of nitrogen except in that form, as nitrogen is inert in every way, and, as well as nitric acid, is without smell and invisible. Nitrogen, in some shape, is necessary for plants, but there are other things equally necessary."

"But I understood the Doctor to mean that ammonia is the most necessary thing that we are obliged to furnish to plants, and I read more about ammonia, in connection with manure, than of anything else in agricultural papers," said he.

"That is most likely, and there the Doctor is right. But we won't discuss that question just now. I see you have a good piece of meadow, how did you get that drained and reclaimed?" I asked. "I wish my swamp was in as good order."

"That meadow was as wet and rough as this swamp of yours twenty years ago, and it kept me busy for a dozen years or more to get it into the shape it is now," he answered.

"I can't afford to wait so long as that to improve mine," said I; "that would not pay. Let us figure a little about that. Here are about ten acres of land that are worth nothing as they are; the taxes are assessed at the rate of $50 per acre and the interest on the cost of the land is $70 a year. The taxes and interest are now a direct loss every year. If the land was in good grass, you think it would yield 30 tons of hay every year. I think so, too, and it would yield $100 per acre in sweet corn, and more than that if planted in cabbages. Thirty tons of hay are worth more than $300; add the interest and taxes, and there are nearly $400 a year actually lost on the swamp as it now stands. You were twelve years or more getting your land into meadow; if I were as long I should be out of pocket at least $4,000, you see. How did you manage yours?"

"First, I cut off the brush and it grew up into weeds and coarse grass. I dug an open ditch at the head of it and one across it to carry off the water, and then mowed it every year until the coarse grass died out and good grass came in. Now I get a good sort of meadow hay from it, but not more than a ton to the acre. Now, tell me what your plan would have been."

"The chief difficulty in my plan is that it is expensive at first; but its merit is that it will pay for itself in one or two years, and then give 50 to 100 per cent. interest on the cost ever afterwards. I would make a thorough job of it by draining first and then grubbing, leveling and turning over the surface or breaking it up completely and sowing down with timothy, red-top and Kentucky blue-grass in the spring. I should then expect to cut a crop of hay the same year of at least one ton per acre, and two crops the next year of three tons or more. That is my present intention. The cost will be as follows per 10 acres:

480 rods of ditch at 25 cents	00
Grubbing at $10 per acre	100 00
Plowing, harrowing and seeding	100 00
Total	$320 00

"This is a large estimate. I have found that I can get an acre of ground turned with the spade for $10, and there could be no better manner of preparing the surface than by spading it. There will be no better time than the present for making improvements. The only difficulty is in finding the money; but that can be borrowed, and no *good* farmer can make a mistake in borrowing money to drain or otherwise improve land that will repay the cost in one or two years."

"I don't like going into debt," quietly remarked the old farmer.

"Debt has certainly ruined many farmers," said I, "but a man may borrow and yet not get into debt, strictly speaking. Suppose you borrow, to buy a horse; if the horse is worth the money and you have profitable use for the animal, I don't think you are in debt—certainly you are no worse off than before; so if a farmer borrows money by which he can make his land produce the amount borrowed in one year or before the debt becomes due, I don't call that going into debt. A man is in debt when he owes and has no means to pay; if he has the means to pay he simply has a credit, which he can extinguish when it becomes due. John Johnson, the old veteran among American farmers, borrowed money to buy land, borrowed more to drain it, and repaid both loans before they became due from the proceeds of the crops."

"That may be all very well, but I would not advise any man to go into debt. Slow and sure has been my plan for 60 years, and it has kept a good roof over my head," said the old man.

"'Slow and sure,' is a very good motto," said I, "but 'fast and sure' is a better. In these days a farmer must go fast to keep up with the times, and it is not so much what a man *may* do as what he *must* do to carry on his business profitably. There is no other expenditure of money so profitable as draining wet land, and no good farmer need fear to borrow money to make such improvements on his farm as that; that is, if he only secures time enough to realize the profits from the improved land. We see the cost of draining and reclaiming this swamp will be $320, how long will it take to get that money back again?"

"Thirty tons of hay would do it," replied the old man.

"Well, you thought this land ought to give me that every year, and if it does no better than half that, the improvements will be paid for in two years."

"What kind of grass do you think of seeding the ground with?

"I have been considering that," I replied. "On moist ground timothy succeeds very well, but cows do not like the hay; red-top is the best grass for low, moist ground; but the hay is light, and not sufficiently nutritious. Mixed grasses always make the best hay, and you can get a heavier crop than of any one single kind. I intend to try a mixture of timothy, red-top, Kentucky blue-grass and orchard-grass, using four quarts of timothy and twelve pounds of each of the others. This will make a thick, close growth and yield fine hay which cows like."

"I have found orchard-grass to do very well on our bottom lands; it is an early and a late grass, being first to grow in the spring, the first ready for hay and the last green in the fall," said the old man. Then changing the subject suddenly he inquired how it happened that the ditches in the swamp were dug so evenly and neatly.

"The men have patterns to work by," I replied. "An evenly-cut ditch, with a regular slope to the wall, will remain a whole year without caving; and in tough swamp muck will keep its shape longer than that. In swamps, the ditches should remain at least a year before tiles are laid in, so that they should be cut properly at the first, lest the sides fall in. The

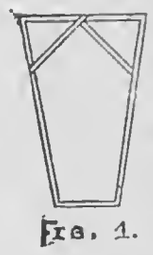


FIG. 1.

pattern is made of lath or narrow strips nailed together (see figure 1) and the ditch is cut to match it in width and depth. When the work is measured up, the ditch is compared with the pattern and if it is not right, it has to be made so before the work is paid for. A newly drained swamp will settle down considerably as the water drains off and the soil becomes solid. If tiles are laid before this occurs, there will be danger of disturbing them and spoiling the drain. After the ground has settled, the ditches may be cleaned out, the tiles laid and covered. The work will then be permanent and the surface uninterrupted."

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

MR. SLADE came over the other day to get a buck for his sheep. Ours were all rented. He had a flock of pure-bred Merinos, but had made up his mind to breed sheep for mutton, instead of for wool, so he wanted to make a suitable cross. We recommended to him to get a South-down sheep, but he said he did not know where to find one, and he did know of several Cotswolds he would obtain. We advised him to get one with the closest wool, the shortest legs, the broadest back, and the smallest head. In our cold and changeable climate, we want sheep with thick and close fleeces, hence a long, open-wooled Cotswold would be a bad sire, but such an one as we recommended would be better. He did not know that there was any difference in the wool of Cotswolds. There is, and some of them have very loose and open fleeces—a very poor protection for a rainstorm in cold weather, or for any storm. Their wool is long, bright and handsome; but the farmer who wants hardy sheep, should give them a wide berth. The same is true of the Leicester. A short-legged sheep will mature more quickly, and is more hardy and quiet. This latter point is quite an item. A ram with a big, coarse head will bequeath the same coarseness to his posterity and make the yeaning all the harder; hence the size of the skull is important.

With a Cotswold ram possessing the above qualities, Mr. Slade can get good market lambs, provided he feeds his Merino ewes bountifully. Unless he does, the big frames of his half Cotswolds will be lank and gaunt, and the butchers will reject them until they are able to eat grass and fatten themselves. A South-down cross would be smaller and plumper, and will fatten younger. If Mr. Slade saves his ewe lambs and breeds them to a Cotswold ram, he will not have so much trouble about making milk for the young, as they will produce more milk than the Merino mothers. The third cross will be seven-eighths Cotswold, and will be essentially equal to the full-bred. If the sire has all the time been a close-wooled sheep with short legs and a small head, and the ewe lambs which were like him have been selected and bred from, Mr. Slade will have a large, strong and productive flock of hardy sheep. We are making a flock the same way, only we shall cross the Merinos with South-down and Shropshire—the latter dash to get more size. When the readers of the RURAL hear of the Kirby Homestead Downs, they will know our secret, to which they must add clover hay and turnips.

A little knowledge will often make a partial success, when otherwise it would be a failure. The man complained that the calf did not learn to drink. It did not take up the milk when he put his finger in its mouth. The man put his finger into the side of its mouth and the calf could not make a vacuum and draw the milk into its mouth. This is what a calf has to do to suck. As soon as the finger was put into the front of the mouth, the calf was all right and drew the milk in rapidly. Then the man remembered that calves do not suck through the sides of their mouths.

The older we grow the more we are impressed with the importance of one of our rules, "that the only time to do a thing is when it is in the mind." We put off opening the cider barrel at the time and forgot it, and it nearly bursted before it was noticed. Cider should be opened at the bung as soon as it is placed in position and the cask kept full, and all of the impurities will work off. It will then make vinegar more quickly, and that of better quality, being free from taint. The cider is also more palatable and healthy. Not being allowed to work itself clear is one of the reasons why many barrels of cider will not turn to vinegar. Pure cider will always make good vinegar, as this is the natural chemical change which time will produce.

If a cow has all the corn stalks she will eat she will give as much milk as if fed on hay. She must not be compelled to eat the stems but be allowed enough so that she can select the leaves and husks. Of course, we mean stalks cut and cured before frost, and before they are over-ripe. More sowed corn would be grown if it was not so difficult to cure. Mr. Heaton had a crop this year in drills, which averaged ten feet in hight. He cut it down and let it lie a week in the sun, and then bound it up in small bundles and set a dozen together in one stook. He draws it into the barn as it is required for feeding. Such bulky fodder could not be stored handily, and it would surely mold and spoil if it was. If fodder corn could be raised close by the barn, it might be fed in the field in the middle of the dry, pleasant days, and drawn to the barn in inclement weather. Esquire Davidson has a small village of corn-stalk stacks around his barn. He sets a tall pole firmly in the ground and places the bundles of stalks around it with the tips towards the pole. But one tier of bundles is placed around a pole. This is his plan, and it is the best one for stacking, as the stalks do not mold.

When animals are lying down they are supposed to be gaining the fastest. This is no doubt true if they are in a comfortable condition. How much could our neighbor's calf gain during a week of cold rain, while being compelled to lie on the wet ground without any shelter?

Farm Economy.

IN-DOOR WORK.

Now that the weather is too cold for out-door work, I will make a few suggestions about the manufacture of certain articles which can be made in-doors and are almost indispensable on a farm.

GRAIN TROUGHS FOR SHEEP.—There are many ways of making these, but they are best constructed so that they may be revolved. Double boxes may be made by simply nailing three boards together, two of them seven and one four inches wide. Set the narrow board upon one edge, lay the surface of one of the wide ones upon it, and nail it firmly down through the center of the wide into the edge of the narrow one; then turn the narrow board up-side-down and nail on the other wide board in the same way, and you have a good double trough. On the ends of this, nail pieces of board fifteen inches long and twelve inches wide, and you have an invertible grain trough. Be careful that the pieces are nailed so that the ends of the trough will be exactly in the center of the end boards.

A PIG TROUGH.—Take two boards as long and as wide as desirable, one inch or more thick; let one of the boards be just the thickness of the other narrower than it; for instance, if inch boards, have one seven and the other eight inches wide. Nail the two boards together in the shape of the letter V—the side of the wide on the edge of the narrow. Saw the ends off evenly, and to them nail, crosswise, boards of the same width extending down to the ground, so as to prevent the whole from being easily upset.

WHIFFLETREES.—Farm whiffletrees should be made about thirty inches long. Hickory is the best timber for the purpose, although good ones may be made of tough oak and ash. If of good timber 1½ inch thick by 2½ inches broad

in the center, they will be heavy enough to stand the strain of one horse. Make the ends according to the irons. If small at the ends, their appearance is improved and the strength is not very much lessened.

DOUBLETREES.—These should be of first-quality oak, 2 inches thick and about 4½ inches wide in the center and 3¼ at the ends, to be of good proportion. For the clevis pin, a strong, flat staple should be inserted in the center and on the side next to where the whiffletrees are fastened. This is better than making a hole through the timber, as it is much stronger.

FIELD HARROWS.—For thirty teeth, make the harrow in two sections having three pieces of timber in each, two of them five feet long and one five feet six inches for the center. Bore the holes for the teeth thirteen inches apart, which will bring the outside ones four inches from the ends. The sections should be two feet four inches wide. When a lighter harrow is desired, make the sections two feet wide; cut the timbers four feet eight inches for the outside bars, and five feet two inches for the center—teeth twelve inches apart. * * *

Kentucky.

ECONOMIES OF CO-OPERATION IN FARMING.

A NUMBER of young farmers, each having a little money, finding business dull and wages low last season, concluded to unite themselves and their capital and form a co-operative company, and go to farming on their own account. They procured a large farm at Gunston, Va., well situated for growing vegetables and small fruits for the Washington market, and commenced operations by organizing themselves into one large family.

They find that this plan reduces the cost of living nearly one-half, and that many other advantages are gained. If the company were divided into single families, they would require ten dwellings; now one large house takes the place of ten small ones. And this is true of every article used, from a book up to a mowing machine. By dividing the labor into departments, especially in housekeeping, a large saving is made. One woman does the cooking, another the laundry-work, etc., and each becomes expert in her special line, does a large amount of work easily and well, and is relieved of the many cares that wear out farmers' wives.

By joining such an association, a young man secures a pleasant home and a permanent, paying business by investing less than one-fourth the capital that would be required to start him in farming in the ordinary way on such a scale as to make it profitable. Years ago when primitive methods of farming were in vogue, all the tools required for farming in the most approved manner could be bought for $100. A young man who did not inherit a fortune could start in the business with a prospect of success; but the introduction of labor-saving machinery has changed all that, and now a fortune must be invested to carry on farming successfully. This makes it necessary for young men to form co-operative associations, such as I have described, and avail themselves of their many advantages. At no distant day, such organizations will be found in all parts of the country, where industrious, moral and intelligent young men and women may always secure a pleasant, permanent home and constant employment at such wages as will enable them to live comfortable and secure a competency for old age. JOEL A. H. ELLIS.

Gunston, Va.

[We do not altogether agree with the above. —EDS.]

PREPARING TOBACCO FOR MARKET.

THE only subject now interesting to the tobacco grower is the proper handling and preparation of his crop for market. He has little to do with anything else at this time of the year. On his success in these points rest all his profits. This applies as well to the Virginia planter as to the heavier Kentucky shipper or the Connecticut seed-leaf grower. No bungling work must be done now. If a man has a fine crop he may easily ruin it at one handling; if he has a poor crop, he may materially enhance its value by proper management.

Being a manufacturer as well as grower, I speak from experiences in both characters. Assorting as to size and color is most important. Try it, if you will. Put together three bundles of tobacco of three equal grades. Take half the first grade and half the second and half the third and tie them up together—then look at the bundle. You will certainly be disgusted with its appearance. Then take a bundle of the worst grade and tie it neatly, and you will see that this would bring in market almost as much as the one with the two better qualities in it.

Now, as to size: tie a bundle of very long and another of very short tobacco together. See how clumsy it looks. Then separate the long from the short, and see what an improvement there is in the appearance of each bundle. Neatness must be observed in every step of the process of preparing tobacco for market. Don't crumble up the leaves, but keep them always straight. In stripping, don't throw them into a promiscuous heap, but lay them in a smooth, even pile by your seat. In every stage handle them with care and neatness.

Buncombe Co., N. C. S. C. SHELTON.

Field Crops.

DOURA.

UNDER the generic name, Sorghum, are found many varieties of plants that have been cultivated so long as to form races; and though specific names have been given to many of these, the points of difference are hardly prominent enough, as yet, to entirely justify a classification of them as distinct species. Much confusion is occasioned by the many names given in different localities to the same varieties. Several varieties of Sorghum vulgare are cultivated in this country, each for a different purpose. Sorghum saccharatum, known as Chinese sugar cane, is grown for the molasses manufactured from its juice; another, known as Broom Corn, for the manufacture of brooms, and still another, Indian Millet, is cultivated for its grain, more particularly around the Mediterranean, Asia Minor and the East, where it is extensively used as an article of food.

DROOPING SORGHUM.

Of the grain-producing varieties, Doura, also called "Guinea Corn," "Doora," "Durra," "Dana," "Jawari," and many other names, is a plant that is likely to have a future as a forage plant, particularly in the Southern States. The engravings represent Drooping Sorghum (*Sorghum cernuum*), which is sometimes incorrectly called "Pampas Rice." Prominent farmers of the Southern States, pronounce Doura superior to nearly all other forage-plants in that locality on account of its rapid growth; but whether it will prove of the same value in Northern localities can only be ascertained by experiment. Under favorable circumstances—that is, in a rich soil and warm climate—it attains a hight of from 10 to 16 feet. The leaves are about two inches broad and two to two and a half feet in length, much resembling those of Indian corn.

To thrive well, Doura needs a warm, fertile soil, well prepared and richly manured. The seeds can be sown in the spring, when all danger of frost is over, either in hills, at such distances apart as will allow the use of the cultivator, or in drills from 2½ to 3½ feet apart, the distance varying with the fertility of the soil—the poorer the land the more space is required. If sown in drills, the seed should be dropped about four inches apart, and as the plant suckers quite freely, when about a foot high, they may be thinned to a distance of 10 to 12 inches. Careful weeding and cultivation with the hand-hoe, are necessary while the plants are young; later the cultivator may be used.

DWARF SORGHUM.

When a hight of four to five feet is reached, the cutting for forage commences, and as a new growth starts from the roots after each cutting, it may be repeated as often as the crop has attained the above-named hight, which, in the Southern States, will be about once a month.

Drooping Sorghum (Sorghum cernuum), differs from common Sorghum in the bending over of the heads and the length of the flower-stalk. In Africa and India it is cultivated for the grain; but in this country will hardly be of importance except as a forage plant.

The engraving showing a single stalk is a dwarf variety of S. vulgare, growing upright and bearing white heads.

AN EXPERIMENT WITH DOURA.

Last spring some samples of Doura seeds were sent to us and to Dr. Hexamer at the same time by R. H. Allen & Co., of this city, for the purpose of testing the value of the plant. Those sent to us were overlooked and forgotten, but Dr. Hexamer reports as follows with regard to his:

"The seeds were sown in the early part of June alongside of Pearl Millet and Reana luxurians (see RURAL, Nov. 2). The seed remained a long time in the ground before coming up, and should probably have been soaked before sowing, and sown about the middle of May. Not knowing the character of the plant, I drilled the seed in like fodder corn. Afterwards, when I found that it came up in a thick mass, I thinned it out to one foot apart in the rows. Several plants, when about one foot high, were transplanted, and seemed not to suffer thereby, making as good a growth as the others.

"The stalks grew rapidly and luxuriantly, resembling Indian corn very closely, but tillering much more, so that each plant appeared like a large corn-hill. By the first of September they had reached a hight of ten to twelve feet, while the Pearl Millet was from six to eight feet, and Reana luxurians from four to five feet high. At that time I cut off a row of each of the three kinds, about six inches from the ground. The Doura made, until killed by frost, another thick luxuriant growth of three feet in hight. At various stages of its growth, as well as when dried, I fed the stalks to horses and cows. They ate them as readily as they would corn stalks. For feeding green, it seems to have the advantage over corn stalks that, on account of its not containing as much water, it may be fed out as soon as cut.

"Whether north of this latitude (Westchester Co., N. Y.) Doura will prove a more valuable forage plant than Indian corn, I am, from the experience of a single trial, not prepared to assert, but I have no doubt that, on account of its great yield and its habit of producing two and three crops in one season, it will soon become one of the most valuable forage plants for the Southern States." F. M. HEXAMER.

PEARL MILLET.

"PEARL" MILLET.

ALL of our old readers will remember our full-page engraving of this plant in the RURAL of Nov. 2. For the benefit of our new readers, we have had that cut reduced, so that though taking up much less space, its general characteristics may be understood just as well. It was the largest of the plants raised at the Rural Grounds last summer, having 52 stalks weighing 42½ lbs. Several plants were cut down August 1st. The average weight of the subsequent growth was nine pounds per plant. Allowing 16 square feet to this plant and supposing one of the same size could be raised upon every 16 square feet, this would give about 57 tons to the acre. Such data for estimates are always deceptive. We should not like to insure half that amount, even though it were cultivated under most favorable conditions. Of the hundreds of "new" things offered every year, most of them are introduced with statements which are altogether impossible of realization in practice. We offer our friends seeds of this Pearl Millet free of charge, believing it to be worthy of trial. That is all we have to say.

EARLY AMBER SUGAR-CANE.

A GOOD deal of interest has lately been aroused in the Northwest with regard to the cultivation of this plant, from which great things are expected. A jubilant correspondent out in Minnesota writes to us:

"The cultivation of the Early Amber Cane is no longer an experiment here in Minnesota, but is now most emphatically a success. Three different companies, one from Boston, one from New York, and one from Cincinnati, are talking of putting up sugar and syrup refineries in our State. Other States are, or should be, just as much interested in this enterprise as our own. I am an old resident of New York and I think I can say with safety that the soil there is as well adapted to the cultivation of the Early Amber Cane as in Minnesota. Any soil adapted to corn will raise good cane, and it will ripen earlier than most kinds of corn. It is more convenient to work it if planted in hills and row it each way. Seed should not be planted more than half an inch deep. There should be six or eight canes in a hill. It ought to be suckered, but will do well otherwise. I would advise to plant two pounds of seed to the acre. The average crop in this locality is from 125 to 150 gallons per acre. Some have raised as high as 300 gallons per acre. The cost of cultivation is but little more than that of corn, and it is a far more profitable crop."

Arboricultural.

PINUS PONDEROSA PENDULA.

(See First Page.)

PRACTICALLY as well as ornamentally Pines perform good service, the large-sized as skirting plantations and backgrounds, or as masses intended for wind-breaks; the small-sized, as beautiful specimens near the house. At present, however, we wish to confine ourselves to the consideration of a single variety, a variety that belongs among the large-sized Pines.

Pinus ponderosa is a Rocky Mountain Pine, one of the grand trees of the valleys of northwestern America. It grows upwards of 100 feet high and four or five feet in diameter with 30 or 40 feet of the stem free from branches. In general appearance it resembles somewhat Pinus Benthamiana, a still larger Pine. Its leaves take, moreover, something of the strong characteristic attitude of those of the familiar Austrian Pine. Less compact in their masses than those of the Austrian, the leaves are looser in the clusters and longer, and if possible more picturesque. The yellow heart-wood of old trees scarcely floats in water and is a

most valuable timber, hence the name Ponderosa.

Pinus ponderosa pendula, the subject of our plant portrait, is a variety of this Rocky Mountain Pine. Mr. H. W. Sargent, of Wodenethe, Fishkill-on-the-Hudson, owns the original of this portrait. It is doubtless the finest specimen in the country. Mr. Sargent says of it: "I imported it from Waterer and Godfrey about 1851, when three or four inches high. In 1859 it was nearly 18 feet high, its annual growth being two and a half to three feet. In June, 1878, it was sixty-one and a half feet high. Sir Joseph Hooker thought it a sport from the normal Ponderosa; but Waterer who raised it from seed, says he has others like it in its very pendulous habit."

We wish to say here that Sir Joseph Hooker was unquestionably right. It is doubtless a sport. Plants may be obtained from the same lot of seed of any variety, which will resemble each other very closely, but the next thousand seeds may produce nothing like them. In fact, no distinctly pendulous tree will reproduce itself satisfactorily from seed, or prove itself a species. As a matter of course, therefore, Pinus ponderosa pendula must be grafted on a kindred stock to reproduce the pendulous form with certainty. The healthy, vigorous growth of Mr. Sargent's tree is alone sufficient evidence of the hardiness in America of Pinus ponderosa pendula On general principles, however, we might expect this: for Pinus ponderosa is hardy, and weeping varieties of any tree are always at least as hardy as their parent.

Pomological.

NOTES IN A NORTHERN ORCHARD—2.

T. H. HOSKINS, M. D.

I will now proceed to a brief description of each of the apples which I have found to be quite hardy at Newport, on lake Memphremagog, near the line between northeastern Vermont and Canada.

Summer Apples.

Yellow Transparent.—This is one of the new Russian apples imported by the Government. The tree is a thrifty, upright grower. The fruit grows thickly upon spurs on the larger limbs. When thinned, it is large, but when not thinned, it is of medium size and very uniform and fair in appearance. The color is a lemon yellow; the fruit is as mellow and pleasant in flavor as the Early Harvest. Its season is fully two weeks earlier than Tetofsky, and it does not drop its fruit like that variety.

Grand Sultan.—This is another new Russian. It is of the same season and color as Yellow Transparent, but larger and of somewhat higher flavor. The fruit grows upon the ends of the branches and scattered over the tree, and not upon spurs, like the Yellow Transparent. I mention this, as some accounts give them as the same. The Grand Sultan seems to be an annual bearer, and gives good crops, but is not so prone to overbear as Yellow Transparent. (See Rural of Nov. 16, for illustration.)

St. Peter's.—This is a small apple, very closely resembling the Early Joe, but hardier. It is productive, and of very good quality, but it is doubtful if it would be a profitable market apple, on account of its small size. Season, August. (See Rural of Nov. 16, for illustration.)

Tetofsky.—This apple is pretty well known and highly valued at the Northwest for its hardiness. It is large, handsome, and very productive, but with me it drops so badly that not one quarter of the fruit reaches maturity. Season, August. (See Rural of Nov. 16, for illustration.)

Summer Harvey.—This variety is described in Downing, p. 367. Much hardier than Red Astrachan, same season, very productive and profitable. Color, greenish-yellow, like R. I. Greening, and of about the same size. Tree, a low, spreading grower.

Fall Apples.

Duchess of Oldenburgh.—This fine and profitable apple is classed with Summer fruit in more southern localities. With me it is not ripe until the first of September. In quality it is far better than when grown farther South, and is first among our retailing apples with dealers in its season. There is more money in it with me than in any other sort—225 trees, now five years planted, average nearly a bushel each, and bear every year. Fruit, uniformly fair and large, many specimens being 14 inches round. Of course, to keep up this productiveness and size the land must be kept in good heart. Tree perfectly hardy.

Peach of Montreal.—Were it not for the Duchess this would be our best market apple of the season—Sept. It lasts a little longer than that variety. It is of the shape and size of Yellow Bellflower, with delicate red cheek. Quality, very good when ripened on the tree, but it will not ripen if picked green, and as it is very soft when ripe, it is adapted only to a home market. A heavy bearer on alternate years. The tree is very thrifty and hardy.

Pringle's Sweet.—Small, about two inches in diameter, but very fair and uniform, and a heavy bearer on alternate years. Fruit, yellow with red cheek; flesh, yellow and of a rich, slightly astringent, but very agreeable sweet. The astringency resembles that of the Louise Bonne de Jersey pear. Its small size is its only fault. It is probably a Siberian hybrid. Season, September.

Prolific Sweet.—This is one of the New Russians. A large yellow apple, mellow enough and rich enough in flavor for dessert, and yet a fine baking apple. Tree, thrifty and productive. It is the only hardy sweet apple of large size and of this season (last of September) that I know of.

Aroostook Harvest.—This variety originated in Aroostook county, Maine, and was received by me from Rev. M. R. Keep, of Dalton, in that county. It is a round, yellow apple, a small medium in size, good quality; tree very productve, thrifty and perfectly hardy. Probably a Siberian hybrid. Season, last of September.

Emperor Alexander.—This is a well-known Russian apple of great size and beauty, but of only medium quality. It is, however, a great and regular bearer and a very profitable market apple, being placed among the first in this respect by the Montreal Horticultural Society. The tree is thrifty and hardy, and the fruit ships well and remains sound up to December.

Plumb's Cider.—Very hardy, very thrifty, a great bearer of good-sized and tolerably fair fruit, yellow with a few red stripes. Quality good, *not* a cider apple, but it got its name from the resemblance of its fruit to the well known Smith's Cider. Season, November. Not so profitable for market as Alexander, but a better apple.

Winter Apples.

Wealthy.—This Minnesota seedling, which has been so highly praised in the Northwest, bids fair to be equally valuable in the Northeast, and to replace the Fameuse in districts where that variety does not quite succeed on account of the hard winters. The fruit is almost entirely red, of medium size or larger, very fair and even in size, nearly round, of very good, almost best, quality, and keeps into February. The tree is thrifty, a free grower, perfectly hardy and very productive. The fruit handles and ships well and commands a ready sale.

Northfield Beauty.—This is very similar to Wealthy, but of a lighter color and more delicate, waxen appearance. Quality even better than that of Wealthy, but not so good a shipping apple, being more easily bruised, and showing bruises more. Tree, probably not so hardy as Wealthy, but more hardy than Fameuse. Very productive of uniform, fair fruit of more than medium size; very desirable, at least for home use and near market. Said to be a seedling of the small, yellow Siberian Crab, and known in some localities as "Cady's Crab." Keeps until March. (See Rural of Nov. 16, for illustration.)

Tracy Apple.—This resembles the Rhode Island Greening, but is only about half the size. Quality, good; keeps until February. Tree, very productive, a dwarfish, slow grower, but hardy.

Meader's Winter.—This is the best of the Winter Siberians. Size, small (five to six inches in circumference). Color, red. Tree, very thrifty and productive; fruit, rich, mellow, and entirely free from "crabbiness;" keeps until March. Tree, "iron-clad;" origin, Minnesota. (See Rural of Nov. 16, for illustration.)

Magog Red Streak.—This and the succeeding variety are native seedlings, originating on the shore of lake Memphremagog, and first propagated by the writer. The Red Streak is a large, yellow apple, streaked with red on the sunny side. No apple looks handsomer in the barrel, ships or opens better. In quality it is very good, the only defect being a fineness of grain bordering, in fully ripe specimens, upon "salviness." The flavor is a mild, rich subacid. Flesh, yellow. The tree is very thrifty, a free grower, comes early into bearing, and is "iron-clad" to the tip of its longest shoot. It is a heavy bearer on alternate years, with moderate crop in intermediate seasons. In eating from January to May. This and Scott's Winter are the only entirely hardy, all-winter apples I have yet found, that fill the requirements of a profitable market apple.

Scott's Winter.—This is a bright red apple of medium size and of good quality, rather more acid than Magog Red Streak. Keeps as long as Roxbury Russet. Tree, an early and profuse bearer every year.

THE ODD YEAR.

The editorial remarks, in the Rural for November 16, on the alternate bearing of certain varieties of Apples, I regard as of great importance to a correct understanding of the conditions of successful fruit-growing. I am aware that most orchardists fully believe in the theory of the even and odd years for the bearing of Baldwins and certain other kinds. The "Odd Year" is an expression so common that many persons consider it a cardinal fact. I know that under existing circumstances and conditions of the business of fruit-farming, certain kinds of Apples having a tendency to bear very profusely, seem to temporarily exhaust their power of production after one heavy crop, but after a year of very light bearing or of complete barrenness they will again give a large yield, if no accident of season or predatory insects happen to prevent them. But has it ever been observed whether good cultivation and the use of a generous quantity of the requisite aliment to produce apples would or would not cause a Baldwin tree, for instance, to bear regular annual crops of apples?

I have had occasion to discuss this subject to some extent with practical fruit growers, and it is my opinion, from facts within my own observation and from the well considered opinions of others, that in the nature of the case there is no necessity for the irregular habit of bearing peculiar to the Baldwin, Hubbardston Nonsuch and some other varieties, except the compulsion which follows a season of heavy bearing while no system of cultivation or fertilizaton of the soil of the orchard is practiced—or, I may add, except the accidents of winter killing of fruit buds, insect ravages, or some such extra calamity to which all orchard trees are liable.

Now, it is a fact, as the Rural has stated, that young orchards do not show this peculiarity for several years after they commence bearing, and that this regular habit of fruit production is only checked by the accident of winter or spring frost injuring the buds or blooms, causing a cessation of the natural draft upon the organic forces of the tree. While it is undergoing a season of enforced barrenness, the tree is storing up a vast amount of fruit-producing power, and the next season it may yield a greater crop than it ever did before. After all is said, it is plain, I think, that the cause of alternate bearing is of climatic or other accidental origin. This theory the Rural has set forth very distinctly, and the facts to substantiate it do not warrant the assumption that it is a natural peculiarity or necessity of any variety of Apple to bear or cease to bear every alternate year.

The years 1875 and 1876 were memorable in this section for great disasters to apple orchards on account of the ravages of the forest caterpillar. Those who by persistent care and battle with the enemy prevented the defoliation of their trees, were rewarded in 1877 with an abundant crop of fine Baldwins, and the trees even bore some apples during the two years first-mentioned, while those orchards which were left exposed to the unchecked ravages of the caterpillars bore no fruit in 1877, and are, in fact, now mostly dead or dying. Yet I know of cases where trees which received the benefits of constant cultivation during the caterpillar years, and leafed out well last year, have borne extraordinary crops the present year, and late in the fall indicated a probability of a good crop next year. Thus, I think, as "no human efforts can alter the bearing year," it is within the possibilities for us to enable our trees to be annual bearers, by proper treatment, provided a sudden change of weather or other unforeseen accident does not interpose its veto upon our endeavors. G. F.

Harrison, Me.

Floricultural.

HOW TO HAVE NICE PLANTS.

The inquiry is often made of me by people when visiting my green-house, "How do you have such fresh-looking plants?" And, thinking perhaps some of the many who read the Rural New-Yorker would like to know how I treat my plants, I venture to write the following.

First of all, I am very careful not to have any dust set in motion in the house; for when plants are in a healthy condition, the pores of the leaves are all open. Dust falling on them fills up the pores, causing the leaves to look dry, and after a while to fall off.

Second, I am careful to give my plants water when they need it most, and not to give any when the earth is already wet, as too much moisture causes them to turn a dark green and the roots begin to decay. On the other hand, if kept too dry, the edges of the leaves first, and then the whole leaf, will turn yellow, and soon the entire plant looks as if it had stood where the fire had scorched it.

Third. I am careful what kind of soil I use. For Geraniums I use three parts of decayed sods, two parts of scrapings of the barn-yard, and one of sand: for Heliotropes, three parts manure, one part sods, and one, sand. Many fail to have healthy Heliotropes by not having the soil rich enough. For Carnations I use sods, two parts; manure and sand, one part each: for Roses, leaf mold, two parts; manure and sand, one part each: for Verbenas, sods, one part; manure and sand, one part each. I give the soil for these five sorts as they are the most commonly grown. If this mixture is used, and the plants are treated in the way I have described, I think any one may keep them nice and thrifty.

In conclusion I will say, give your plants all the sun possible, moving them only when obliged to, keeping the temperature at 60 degrees, and those who have failed previously, will, I think, be successful now.

Scientific and Useful.

ATMOSPHERIC DEPOSITION OF MOISTURE IN THE SOIL.

COE. F. AUSTIN.

During the summer of 1864 there was in this region no rain, except a very slight sprinkle, between the first week in June and the last week in July: yet corn was never a better crop. Of course, I had learned, from experience and by precept, that it was important in a dry season to plow the corn ground deep and to keep it loose, in order that it might become damp during the night; but I had never learned why. I had somehow conceived the notion that the moisture came up from below by capillary attraction; but a moment's reflection convinced me that this notion was erroneous, and I now asked myself seriously for the first time "Why is it?" and the answer quickly came: "The moisture comes out of the atmosphere the same as dew."

Examples of Aqueous Condensation from the Air.

In common with many other people, I had watched with interest the moisture which was diffused equally throughout the air of a warm room, collecting upon and trickling down the cold window pane. I had seen, during a very severe drought, water run in a stream from a table upon which there stood a pitcher of ice-water, the thermometer registering 102° in the shade at the time, and the pitcher standing in a draft between two windows, with the wind blowing quite fresh from the south. In South Jersey I had seen the tender garden plants wilt down in the forenoon under the influence of a westerly breeze which came off the land; but when less than an hour afterwards the wind had shifted to the south and was coming off the sea,—which it usually does in that region in the summer time between the hours of 11 A. M. and 2 P. M.,—I had seen the same plants revive and stand up stiff and vigorous from the moisture which the damp south wind had brought to their roots. I had noticed that cellar walls were always damp in hot weather, even in a drought. I had seen springs which issued from slate ridges increase their flow very perceptibly in dry weather just before a rain, thereby indicating an unusual amount of moisture in the atmosphere. I had seen a well dug at the brink of a slate ridge, that was said to be always dry in the winter and spring, although it always had water in it in the summer and fall. I had noticed that loose ground got damp to a considerable depth during a clear night in hot, dry weather, while compact earth remained dry; and that corn growing on ground plowed deep and kept loose, was not injured by a drought which commenced as soon as it was fairly up, and ended just before or about the time it began to set. During a severe drought, I had seen that portion of a garden over which earth had been thickly strewn which was taken from a place where kitchen slops had been emptied for a number of years, produce fine vegetables without watering, while those grown in the rest of the garden, *even with watering*, were almost a total failure: and I reasoned that all these effects were produced by one and the same cause, viz.: by the actual contact of a warm gas (air) containing moisture in diffusion with the colder surface of a solid,—the effect in the last mentioned case having been intensified by the water-absorbing property of the saline matter in the soil.

Conclusions Therefrom.

The following is a *resume* of some of the most important conclusions touching this matter, to which I then arrived:

First: The greater portion of the moisture which sustains vegetable growth during a drought, is condensed in the soil out of the atmosphere, by the actual contact of warm and apparently dry air, with the cooler particles of the soil. In hot weather there is always a large amount of moisture in the air, even when it is apparently very dry, and as cold air can hold in suspension less moisture than warm air, the atmosphere becomes overcharged with moisture the instant it cools down to the "dew point." During a clear night the earth loses its heat very rapidly by radiation, and if the ground be plowed deep and kept mellow, the air diffusing itself freely through it and becoming cool, deposits its surplus moisture on the surface of each particle of soil with which it comes in contact be-

neath the surface of the ground, in precisely the same way as it deposits dew on the surface of each blade of grass above the ground. A double purpose is thus beneficently worked out by Nature: the parched soil is dampened and the thirsty plants revived while at the same time a large portion of the heat lost by radiation is replaced by condensation, thereby preventing frost, which otherwise would occur on every clear, still night, even in midsummer. This will become obvious when we take into consideration the amount of this condensation, and also the fact that every pound of water condensed has given out to the earth and to the air at its surface as much heat as is required to melt between five and six pounds of cast-iron.

SECOND: Wells and springs are supplied in a great measure, if not wholly, during droughts, from the same source. The air percolates the soil and penetrates the crevices of the rocks, leaving its moisture just as it does on the cellar walls, the ice-pitcher, and the window pane. This moisture trickles down among the rocks by the force of gravity, supplying the veins and underground reservoirs, which in turn supply the wells and springs.

THIRD: Many soils ought to be greatly benefited in dry weather by the addition of anything which, without being injurious in itself, has a strong physical affinity for water—such as chloride of calcium, refuse from salt works, or even the poorest kind of common salt.

FOURTH: It seems that water should rise in the ground by capillarity only when the subsoil is soaked; and then only to a very limited hight. Water under all circumstances being subject to the law of gruvity, cannot possibly rise by the law of capillarily beyond that hight where the force of the former equals the influence of the latter.

EXPERIMENTS ON CAPILLARITY.

It appears that this might be all illustrated and many important questions concerning the whole matter permanently settled, by some very simple experiments with glass tubes filled with earth.

I have made several experiments with folded strips of bibulous paper, as follows: Place the end of a folded strip of paper of this kind in contact with something which is merely damp, and no moisture will pass into it by capillarity; but place it in a tumbler of water, and capillarity will carry the water in the paper to the hight of about three inches above the surface of the water in the tumbler, the paper becoming quite wet as far as the water rises in it. It, now, water be poured into the tumbler, nearly to its top, and a forked strip of paper be made to straddle its edge, the water will capillate up the inside leg of the fork, and rise about three inches in the strip; at the same time it will both capillate and gravitate downwards until it trickles from the outside leg of the fork. But experiments performed with glass tubes of an ample variety of dimensions, and filled with earth, are the only ones that could be considered satisfactory in this connection; partly because earth and paper are very different substances, and partly for the reason that solid matter in an extremely fine state of subdivision, may possibly be subject to the law of capillarity to such an extent that water may diffuse itself in it much as it diffuses itself in air; or, *per contra*, much as air diffuses itself in water. Although this is very improbable, it is quite certain that the air in the soil is a medium through which water diffuses itself in all directions in it.

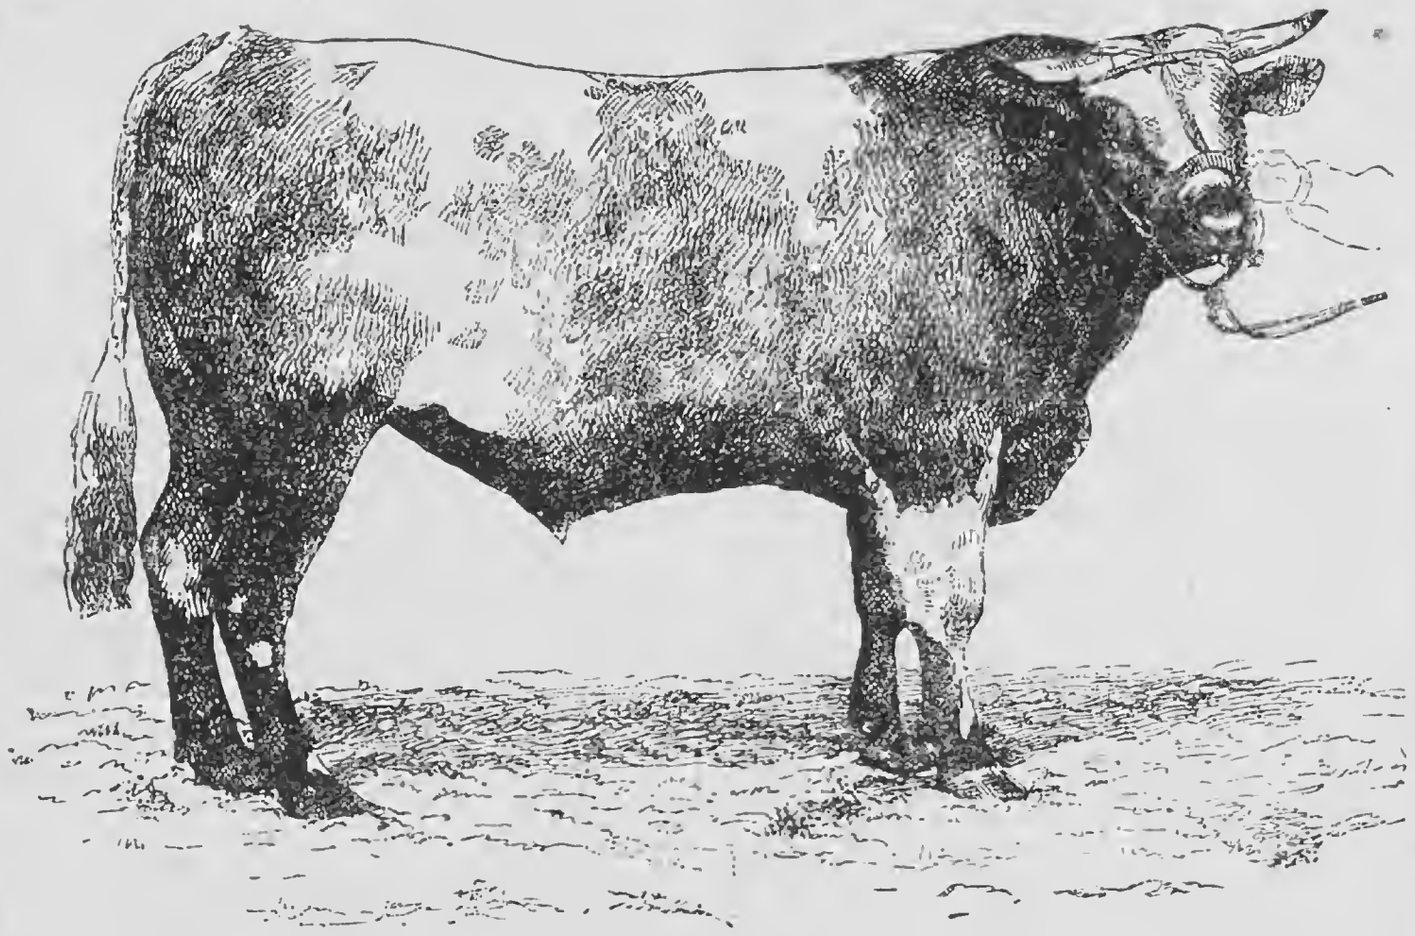
Camden Co., N. J.

The Herdsman.

STOCK NOTES.

FECUND FREE-MARTINS.—When twin calves are produced, one male and the other female, the latter, as most farmers know, is called a free-martin, and, as a rule, is barren. In such cases the internal generative organs are generally imperfect, partaking of the character of both male and female organs, while in appearance these imperfect females often resemble steers. When both twins are of the same sex, the reproductive powers are not impaired; neither is the male twin-brother of a female, sterile. In rare cases, however, the free-martin is capable of breeding, having escaped the malformation of her reproductive organs customary with others of her class. Such exceptions are, however, so rare as to be worthy of mention whenever they are well authenticated. Campbell Brown informs the Bulletin of the American Jersey Cattle Club for this month, that the heifer Irene of Short Hills (*sic*) (5,137) twinned with bull 2,682, dropped on Nov. 20 a bull calf by Jubilee (2,125). She is now the property of Crockett & Johns, Nashville, Tenn. Youatt could discover only two similar exceptions, which he mentions in his work on Cattle.

IN continuation of the portraits of prize cattle exhibited at Paris, we now present a picture of Mornay, which has been crowded out several weeks, a three year, one month, twenty-one days' old Short-horn bull, the property of M. le Comte de Massol, a Sonhey, Cote d'Or—which took the first prize in the class of older bulls at Paris last June. He girthed eight feet behind the shoulders, where he stood fifty-five inches high, the belly line then being twenty-five inches from the ground. His length was five feet two inches from the vertical line behind to the front of the fore-leg, and six inches beyond that to the front of the bosom—a well-made, substantial roan, of admirable quality—perhaps somewhat light in his hindquarters—very fine forwards, and well filled up behind the shoulders. This appeared in the London Agricultural Gazette of Nov. 11.



"MORNAY."

BLACK-LEG.—A correspondent writes us that some years ago he lost several head of young cattle by this disease, and as all attacked died, despite the use of various nostrums, he is decidedly of opinion that an ounce of prevention is better than a pound of cure. He thinks he has hit upon a preventive in a recipe recommended by a neighbor. It is a mixture of salt and sulphur in equal parts, a spoonful of which is to be administered to each animal once or twice a week during March, April and May. Since he commenced this treatment his stock has been entirely free from the ailment. While we do not think this prescription has contributed much to the immunity of his cattle, it certainly can do no harm, as both its ingredients are generally beneficial. Keeping the animals away from wet pastures and infected cattle, and feeding them well during the winter so that they will not be too much reduced to stand against the luxuriant pasturage of genial spring, are far better preventives.

TRUE HERE ALSO.—An English breeder of Jerseys brought the question of judging animals of that breed up before the Bath and West of England Agricultural Society last spring, complaining—1. That none of the judges seemed to know what the characteristics of a good Jersey are, and 2, that while not enough attention was given to milking qualities, too much was bestowed on color and other fancy points. In this respect many Americans, as usual, are disposed to ape the fashionable English follies, not only with regard to the points of the Jerseys, but still more, perhaps, with regard to those of other high-priced breeds.

Miscellaneous.

VAN'S VIEWS.

RAILROAD DISCRIMINATION AND WESTERN IMMIGRATION.

I HAVE just been reading in an agricultural paper a communication bepraising the lands in one of our extreme Western States, especially those along one of the principal trans-continental railroads. Now I don't wish to question the veracity of the writer, for I do not doubt there is much excellent farming land owned by the road; but if he is as disinterested as he claims to be, why doesn't he tell us what price grain and produce are bringing at points along the route of that road. Now I am informed, through a private letter, that out there wheat is selling for from 25c. to 40c. per bushel; old corn for 15c.; new corn, 11c.; pork, 1½c. to 2c.; beef, 1c. to 1½c.; butter, 4c. to 6c. per pound; eggs, 3c. to 4c. per dozen. Now one needs immense crops and to do all the work himself in order to get along at all with such prices for his products. Then, again, the farther west one goes the higher become the prices of sugar, tea, coffee, calico, cotton goods and clothing. Moreover, those shipping through freight are now getting "special rates," which are a "special" outrage on way shippers. Chicago is a big city: it is a fine city; it is a prosperous and growing city, and we are all proud of it; but we can hardly afford to let it have the life blood of all the other cities in the West to make it grow and wax great.

A few years ago, we had in this State a fight with the railroads and they had to suffer from the notorious "Potter Law." That law was an outrage 'tis true, and a reaction therefore set in soon after its passage; but it taught the railroads a lesson, and for a time they were tolerably civil, but now they seem to be getting extortionate and need another lesson. Almost every farmer in the West, and thousands doubtless in the East also, are unhappily familiar with their injustice, but for the benefit of the few who may yet be ignorant of the manner in which they themselves are suffering from it, I will cite a local instance of their oppression.

From Chicago to Ishpeming is a distance of 422 miles; from Fort Howard to Ishpeming the distance is 180 miles—less than one-half the distance between that town and Chicago. Now, the former place is right on the through line and 242 miles nearer Ishpeming than the latter, yet a Chicago man can send a car-load of miscellaneous freight to Ishpeming for $42, while a Fort Howard man for the same class of freight to the same place must pay $52. "If this isn't "sweetening" us with a vengeance. I am unacquainted with that process—$10 more for the same amount of freight over less than half the distance on the same track!

While prices are good and crops fair, the ordinary farmer will stand being swindled a trifle; but when the crops are poor or prices low, and especially when, as in this year, both combine to make it hard for him to pay the "tin per cent," which the "friend of labor" *will* have if he can persuade the farmer to burden his place with a mortgage, then the farmer begins to look into things, and after a while he and his fellows send to the legislature men who enact laws to check the rapacity of these soulless corporations.

History teaches us that the retributive passions of those who have freed themselves from oppression are proportinate to the degree of oppression from which they have been released; and so it may happen that these new legislators, urged on by the accumulated wrongs of their constituents, may make laws against the railroads as unjust as is the discrimination of the latter against the farmers. But much of the blame for the injustice of even such legislation must be borne by the corporations whose monstrous exactions may goad the agricultural community to misuse the power which former experience has taught them now rests in their hands.

Now, when our State legislatures shall "fix" the laws so as to prevent this unjust discrimination—and they certainly will do so—what will be the price of produce and grain in the extreme Western States? Indeed, I very much doubt whether, in any case, roads will give these special rates after they have sold their lands. Before emigrating to these parts of the country, therefore, for the purpose of farming, a man should take all these considerations into account, and be careful to look well ahead before jumping.

WHAT OTHERS SAY.

THAT DEPENDS.—"Give a sample of fertilizer to twenty chemists, and they will agree upon its chemical value," says the Scientific Farmer. "Give a fertilizer to twenty farmers, and no two will value it alike. One may call it worthless, and no two will assign the same crop production to its use. We might as well come to the conclusion at once that the agricultural value of a fertilizer depends upon who uses it—on the land, on the crop, and on the judgment of the user. Give a ton of superphosphate to this man to grow corn, and let him use it on land unfitted for corn, and the fertilizer is condemned. Give it to that man who applies it to corn land, and it is pronounced good. A hundredweight of fertilizer or dung applied to one field may produre double the crop of another field upon which one hundred pounds of the same fertilizer has been strewn."

WHEN TO STOP MILKING.—President Hoffman says, as reported in the Husbandman, that there is as great a difference in cows as there is in men. Some men can work three hundred and sixty-five days in the year and, for a time, seem to get no hurt from continual application, but it will be found at last they are drawing on reserved forces that sooner or later will be exhausted. So there are cows that will give milk all through the year, but he was not considering them. As a rule all cows need rest. If there should happen to be in a herd a few that would milk clean through to calving again, he would not regard it as an advantage. They will wear out sooner. The habit of milking close up to calving may be cultivated, but he does not regard it as profitable.

DOGS AND SHEEP.—"For two years in succession dogs have killed our sheep. The tax on dogs annually collected in each town is set apart to pay the damages they cause. The damages so far exceed the awards that several years will elapse before the tax will pay off claims already audited. Any one who keeps a dog and does not give him three "square" meals every day, ought to be fined. If this were done there would be but very few sheep killed by dogs. Until this is done—or, at all events, until dogs are better fed—the starving cur will help himself to mutton. He really ought not to be blamed as much as the thoughtless or cruel owner." So speaks the genial Col. Curtis in the N. Y. Tribune.

COST.—"It should never be forgotten," says Mr. Meehan, "that it costs something to keep up a garden as well as to maintain horses and carriages," which is true with this difference, that the plants of a garden can be obtained without much cost and can be left to take care of themselves for considerable periods. Mr. Meehan advises the employment of good gardeners, which is good advice for large gardens and wealthy people. But every country home should have its garden, large or small, and it is a poor family indeed that cannot find time to give it needful care.

"IT is absurd," says Dr. Blackmer in the New England Homestead, "to suppose that we can 'keep one up' or 'run one along,' who is prostrate and feeble, on rum, whisky or brandy. Not only is it theoretically true that an article which is neither digestible nor a promoter of digestion cannot keep one up very long, but practically it has been abundantly demonstrated that we can keep one up far better on oatmeal and beef tea and milk."

THEORY AND PRACTICE.—"A pretty fellow you are to instruct the public on rural matters, when you can't supply your own table with vegetables, or raise a good head of celery to save your neck!" A faithful report of domestic conversations on this point between agricultural editors and their wives would be very funny—to the public. Thus writes Mr. Coleman in his sprightly farm and garden column of the Christian Union.

CONSTITUTIONALLY TIRED.—An instance of a man who was born tired is mentioned by The Mark Lane Express. He hired out as coachman to an old lady, and showed his triumphant skill as a shirk by cleaning only that side of the horse and carriage that came round in front of the door.

GREAT SALE.—A bee-keeper in England, wishing to change his business, advertised "an extensive sale of live stock, comprising no less than 14,000 head, with unlimited right of pasturage."

Dairy Husbandry.

GRAIN FOR DAIRY COWS.

T. H. HOSKINS, M. D.

The question is often mooted, "Does it pay to feed grain to cows in milk?" I have heard it discussed for a whole day in an agricultural meeting, and as I sat at the reporters' table taking down the words of the speakers it came to me forcibly how much is lost in all such discussions for want of a clear understanding of the question, to begin with. For it was plain that the question, as stated, was too broad. It was like asking, "Does it pay to raise potatoes?" It may, or may not, according to circumstances, and people may discuss such a question forever without reaching any definite results.

One thing all dairymen will admit—that the profit of dairying consists of the surplus in hand after paying for the keep of the cows, the cost of labor, and the interest on the capital invested. One difficulty in getting at the real profit of a dairy is, that very few farmers have any exact knowledge in regard to the cost of keep or of labor, and consequently have only a very vague idea as to whether their dairies pay anything, and if anything, how much. Under such circumstances how can any farmer—and least of all one who has never tried but one way—be qualified to discuss the subject? Yet I have heard the most positive expressions of opinion given by just such men. In the last discussion of the kind which I attended, a little questioning brought out the fact that the only man—out of ten or a dozen who took part in the argument—who had any figures to produce in confirmation of his views, was the one who fed his cows the most grain and he was able to show a very satisfactory profit.

Suppose the question to be stated in this way—"Under what circumstances will it pay a dairyman in this State, or county, or town, to feed grain to his cows?" Then suppose the disputants to come prepared with the figures to show the results of their trials of one or more ways of feeding, we might here look for something of practical value to come out of the discussion. The actual result in each case would be found to depend, I think, first, upon the goodness of the cows. If a herd is so inferior that no quantity or quality of feed would force the average annual butter yield above 125 pounds per cow, and they would yield that quantity on the ordinary grass and hay feed of the farm where they were kept, then it is plain that it would not pay in *that* dairy, to feed grain.

But, second, suppose it is found that the herd is of such a quality that it can be made to increase its yield by better feeding; does it follow that even then it would *pay* to feed grain? Might it not be that some cheaper feed would bring the herd to its highest yield? By improving the pasture; by growing some green crop to feed in a dry time; by cutting the hay earlier; by not dogging the cows; by having better and warmer stabling; by feeding more or less green feed in the winter, might not *this* herd be pushed to its fullest capacity? If so, then plainly it would not pay to feed them grain.

But again, thirdly, suppose that by careful breeding, purchase and selection, a herd is got together so superior in milking quality that, after every practical improvement has been carried out in the matters of care and handling, and all practicable improvement is made in the feeding without grain, it is still evident or possible that the herd is not doing its best—what should prevent the ambitious dairyman from *trying* whether a ration of grain in some form would not give additional yield without injury to the cows and with profit to the owner?

Here comes in another element to be considered—*can we*, with perfect pasturage, or with good pasturage, green fodder, early-cut hay, warm stables, roots and skillful handling, develop the productive capacity of the best herd of dairy cows to its highest profitable point? Some experienced men will say it can be done. Then we have to ascertain (allowing that everything in the way of yield that is possible, is possible of attainment under this system), whether, nevertheless, more profit might not be made by *substituting* grain for a part of the hay, or for the green fodder in summer, or for the roots. These are all legitimate problems for experiment, and must be worked out practically by each individual according to his opportunities and his practical skill and ability.

I think it will be apparent to the intelligent reader that the question, even when brought within the much narrower limits we have put about it, is still one that does not admit of a single, definite answer. The inherent quality of farms, the condition of the markets, the relative prices of grain and grass at any particular place, or at any particular time, must be taken into account before a satisfactory decision can be attained. But one thing I think is sure—as Mr. Beecher is reported to have said he thought it no sin to let a fast horse go fast, so it is good economy to feed a good cow well.

There is another point in connection with the subject that it might be well to mention. There are Eastern dairymen who are feeding large amounts of Western grain to their cows, quite as much for the manure as for the milk. Though they believe they are more than getting their money back in an increased butter or cheese production, they still look with the most satisfaction and hope of ultimate gain, to their larger and much richer manure piles which, used as a top-dressing for mowings and pastures, will enable them to increase the number of cows they can carry from year to year. This attempt to arrest some of the prairie fertility in its way across and out of the country and over sea, is, in my judgment, a worthy one, and likely, in judicious hands, to be profitable; but not to men whose manure stands for six months in the year beneath unsponted eves, or the liquid excrement of whose stables runs to waste. These will not find much profit in feeding grain to dairy cows.

Orleans Co., Vt.

The Poultry Yard.

POULTRY LABORS REWARDED.

Having caught the poultry fever two years ago, I commenced the business of raising fancy poultry on a limited scale, keeping the farm stock on hand as a reserve in case of failure with more fancy breeds. I selected Houdans, Light Brahmas and the Plymouth Rocks to test their qualities for breeding purposes. I kept my former stock in the old hennery, and built for the fancy breeds a new house eighteen by twenty-five feet and two stories high. As I was determined they should not suffer the cold of a severe winter, I was very careful to make close joints, and in addition lathed and plastered the building throughout. After the completion thereof, the fancy stock took possession. It was my delight to look at them in their new home. I visited them quite often during the day, and once each evening.

It was not long before I heard them sneeze on entering their quarters at night. Never having had the roup on my premises and knowing nothing of the disease, I believed they had taken a slight cold, but would soon recover. Presently a swelling commenced about the eyes, and they began to discharge from the nostrils. I then consulted a fancier; to my surprise he pronounced it to be the roup. Hale's remedy was recommended, and I used it with good effect, losing but a small number of those taken with the disease. I tried to find the cause, but could not, and I was kept busy administering medicine to new patients continually. Finally, I invited a brother fancier to visit my hennery in order to get his opinion as to the cause of the sickness. After a thorough inspection of the premises, he advised more ventilation. I set about the work immediately, cutting air-holes on each side of the building, near the ceiling to prevent the currents of air passing over the hens' bodies while roosting upon their perches at night. In a short time the disease began to disappear, and now for several months I have not had a case of roup upon the premises. I am convinced that the disease was caused by want of a sufficient ventilation. I must also recommend cleanliness of the pens. Do not suffer the droppings to lay months, or even weeks in the building to taint the air with pestilential odors. Keep the house free from vermin, and I am satisfied there will be little or no disease among the poultry.

I do not attempt to instruct breeders of experience; I would rather apply to them for information; but from a perusal of these notes, such as myself who are commencing the business either for pleasure or profit may receive some benefit, and gain some hints for the construction of any buildings they may propose to erect. By profiting by my experience they may be relieved from much of the trouble and expense that have fallen upon me. Although I had kept poultry running at large upon my farm for more than twenty years, as I paid no attention to their wants (food excepted) I was as ignorant of their necessities as if I had never kept any fowls upon the premises, and I presume the majority of farmers know as little of the care of poultry as I knew when I placed them in unventilated quarters. I soon learned, however, that extra care and attention are needed to produce results sufficiently profitable to encourage one to continue the business until success rewards his efforts, and a like experience has doubtless led many others to the same conclusion. C. S. COOPER.

Bergen Co., N. J.

A GOOD WORD FOR THE DORKING.

In the late Poultry number of the RURAL, I noticed that but little credit was given to the Dorking as an egg-producing bird, and of her merits generally only a low estimate was given, which, no doubt, the writer thought a correct one in her case. Having had the poultry fever (slightly, perhaps), for a number of years past, and having during its course tried a number of the different birds, without that entire satisfaction that many experience with certain favorites of their own—if we judge by their statements as published in the various agricultural journals—a few years since we procured a trio of Dorkings, of the variety called Silver Gray Dorkings. They were of good size, and quite contented, compared with some of the smaller breeds, but they had more life and ambition to get a living than the Light Brahma. We have now had them for six or eight years, and taking them as family fowls for the farmer who wants eggs for his household and chickens for his table, we think them ahead of all the Asiatic races and many of the smaller breeds, when eggs and flesh are both taken into consideration.

During the past two or three years it has been difficult to have hens inclined to sit to furnish what chickens we wanted for our family use and to keep up our flock from the pullets raised, so as not to have on hand a lot of old hens that are thought not to lay as well as young fowls the first season or two. We do not sell either eggs or chickens, as a rule; generally all produced are used in our family, and this year we have had eggs very plentifully, and when the poultry number of the RURAL came to hand, we laid in the scale seven eggs just laid, and they weighed 18 ounces. Probably seven eggs would average a pound the season through; and when a chicken or young fowl is dressed for the table there is (if well fed), enough for a family dinner. So, in my experience, instead of their being tender fowls to raise, and inclined to lay but a few eggs, they are quite the opposite. We have rarely lost a chick the last three years; not one with the gapes or any other disease that I know of, and but three or four in a hundred by accident, an immunity which we think proves them entitled to be called hardy in regard to the raising of the chicks.

I am not prepared to say that they are the best of all fowls, as some say of other breeds, but of any we have ever tried they have come the nearest to what we think a fowl should be for the production of eggs and meat for the farmer's table; and if it were not for their superfluous fifth toe, and the large single combs of the cock, we should think them much nearer perfection than we now do,—as these appendages we consider detriments to them as a breed, and therefore objectionable. Others no doubt differ with us in that respect, but it is from comparing our differences of opinion that good frequently results; hence this letter on the fowl question. JONATHAN TALCOT.

Rome, N. Y.

BREEDING POULTRY.

I have had some experience in breeding poultry and have come to the conclusion that fowls must be bred the same as other stock. If you want a herd of butter cows, you must buy them from a breeder who has made this point a specialty for a number of years and by so doing has originated a family that will transmit to their offsprings the qualities peculiar to their progenitors. To do this requires careful selection and good judgment. Our best breeders don't always get what they breed for; but the poor animals are thrown out and never used for breeding purposes.

I have had Leghorns that were very poor layers, also Plymouth Rocks, and in fact both poor and good birds can be found in all breeds. If eggs are what one wants, let him try the Leghorn, keep an egg record, save the eggs from the best layers and set no others; then he will soon have a family of layers with an egg record worthy of being published. For general use I consider the Plymouth Rock A, No. 1.; but skill is needed in breeding them. When mating Plymouth Rocks there are many things to be considered that can only be learned by experience. Never select overgrown fowls for breeders. I have some extra-large Plymouth Rock hens and find they lay fewer eggs than smaller fowls of the same breed. Last spring I bred ten hen-turkeys weighing from 16 to 23 pounds each. Those that weighed over 18lbs did not hatch one-third of their eggs, while the others hatched nearly all those put under them. It is impossible to get an extra-large amount of butter from an extra-beef cow. I find the same rule holds good with fowls. Feed and care are the chief requisites for successful poultry-keeping.

Elyria, O. JOHN DINNERHORN.

Sheep Husbandry.

FATTENING SHEEP FOR MARKET.

This winter it is a question with the young shepherd and with many who own small flocks of sheep, whether it will pay to fatten some of their flocks to add to the glutted meat market. In view of the low price of hogs in many parts of the country, many suppose the demand for fat sheep will be light and prices consequently low. Undoubtedly this supposition is in a great measure correct, yet in my opinion it will pay to feed a few sheep well so as to have them in first-class condition for market by the last of February or early in March. About that time there is always a fair demand for well-fattened, winter-fed sheep. When the prices are high, it never pays to send a half-fed animal to market, and it certainly must be a losing business to sell poorly-fed stock when prices rule low.

This winter the best sheep only should be selected for fattening; all the others should be retained for wool-growing until better figures can be obtained for fat light-weights or stock sheep. Those picked out for the butcher should be fed generously and regularly, and upon this point too much stress cannot be laid. Care should be taken, however, to give the sheep only just enough for one meal at each feeding-time. If they are given a superabundance of hay, they soon learn to be particular in selecting the best part only, and if there is not enough of this at one feeding-time, they will wait half-hungry for the next. My own experience agrees with that of most successful sheep owners that fattening animals should be fed three times a day; though some of my neighbors think twice often enough. It is also very important that the sheep should not be allowed to suffer from want of water; neither should they lack a supply of salt; for although salt is not so necessary to them in the winter as in the summer, still they will thrive better if it is fed to them at least once a week at all seasons. J. A. T.

Various.

CATALOGUES, &c., RECEIVED.

PENN. FRUIT GROWERS' SOCIETY. The twentieth annual meeting of this Society will be held in Adler Hall, Reading, Pa., commencing January 15.

THE ILLUSTRATED ANNUAL REGISTER OF Rural Affairs and Cultivator Almanac for the year 1879, containing practical suggestions for the farmer and horticulturist, with about 130 engravings. By J. J. Thomas, Luther Tucker & Son, Publishers, 395 Broadway, Albany, N. Y.

SHAKERS' Descriptive and Illustrated Annual Catalogue and Amateur's Guide to the Flower and Vegetable Garden. Charles Sizer, Mount Lebanon, New York. This is a handsome catalogue of 84 pages, well illustrated, upon an excellent quality of paper. It deals for the most part with the good, old well-tried sorts.

A SERIES of books for the farmer, by Conrad Wilson. The present one, which is the first of the series, treats of Chemical farming; its possibilities and mistakes, illustrating the necessity and value of chemical elements when rightly used, and the danger of them when the conditions are wrong; including, also, an examination of the Stockbridge formulas. The price is 25 cts., or 50 cts. in cloth. Published by The Farmers' Publishing Company, P. O. box 2695 or 104 Duane St., N. Y. Each number of this series is complete in itself. Conrad Wilson is well known as an earnest, thoughtful, indefatigable worker for the good of agriculture, and we are confident that those who purchase this book will find in it instruction worth far more than its trifling cost.

THE thirtieth semi-annual statement of the Travelers' Insurance Company, which we publish this week, shows the company to be in a very strong position. It will be seen that there is a net surplus of $657,107.38 over and above capital ($600,000) and all liabilities. A close inspection of its investments shows, too, that care and discrimination have been exercised in selecting securities that have at any time an available cash value. The statement shows that the gain in resources is substantial, and there is a gratifying absence of any "padding out" with over-due interest, or other items of like character, that are not unknown devices in the statements of some companies. With the year just closed, the Travelers' has added $281,500 to its assets, and $46,700 to its surplus—an achievement as gratifying to the general public as to the company.

IT seems to be a fact that just in the ratio of a man's ignorance on a subject is his exceeding haste to express his opinion on it. This was aptly illustrated the other day by an anecdote repeated in our hearing.

Mr. Ex-Attorney General James Speed is an eminent lawyer practicing in the city of Louisville and living on a small farm on the outskirts of the city. All his time being devoted to his profession, his farm knowledge is necessarily limited. His brother tells this joke of him. "If I ask Jeems a law question, he hems and haws and wants to know all the facts, and then asks time to consult his books; but if I ask him a farm question about the rotation of crops or the breed of cattle best adapted to beef or milk, he answers me in a second. I suppose if you know nothing about a thing there is no need of hesitating in delivering your opinion.

Everywhere.

RURAL SPECIAL REPORTS.

N. Y., Rome, Jan. 4.—The winter wheat went into winter quarters in this vicinity looking very well. The ground was well soaked with water when the snow came, and there was no frost in it. We have had almost a continuous snow-storm and blow since Dec. 9th, except on the 10th, and that was a very rainy day. The wind changed to the west at night and it snowed hard on Wednesday morning, and from that time to the present we have had snow and wind storms, such as are not often seen with us at this time of the year. Christmas week was of unusual severity for the season. New-Year's Day was mild and very pleasant. Since then we have had snow and wind, with thermometer at zero on the 2nd; 10 deg. above zero on the 3d, and 18 deg. to 20 deg. above on the 4th. The snow is badly drifted and there has been no travel on the roads for two days. The prices of produce are very low in this section, except potatoes, which are worth $1 per bushel at retail. Poultry has been very abundant and cheap, and mostly of extra good quality in our market. J. T.

[There was nothing more plainly foreshadowed in our Everywhere reports than that potatoes would be high this winter. We are glad to know that a number of our subscribers have profited thereby.—Eds.]

California, San Gabriel, December 25, 1878. We bought this land two years ago last spring, and immediately plowed it thoroughly—it had never been plowed before. We set out a row of Blue Gums (Eucalyptus globulus), for a fence. They were in seed boxes, the tallest one foot in hight. Last month we cut six of them for posts to the roof for a shelter for hay, and one of them measured forty-two feet in hight and six inches in diameter at the base. We set out some seedling and some budded orange trees in June the same season, and all the budded ones have more or less fruit on them this year. We have all the varieties of fruits of the northern or temperate zone, and all of the semi-tropical that are to be got here. We expect to have fruit of some kind fresh from the tree from the first of January to the first of January. The Guava does well here and the Banana promises to do well also. As yet we have not the latter thoroughly at home here, but it is doing well in Santa Barbara, and also at Orange, forty miles south of here. A. P.

Penn., Schuylkill Haven, Jan. 9, 1879.—We are located on the southern border of the Schuylkill coal fields. Coal being low and a limited quantity having been sent to market during the past year, business of all kinds is depressed. The Phila. and Reading Railroad Co. is the great controlling Corporation of this county, and this Company is now paying its employees in scrip worth $10 each, payable the 15th day of April and May next. It is received at any time by the Company for fare, tolls, freight, &c. This is proving to be a temporary relief. Produce of all kinds is low, as the masses are poor and must buy low, if at all. The farmers complain bitterly of the depressed times, and yet they are much better off than any other class here. W. A. F.

N. Y., Naples, Jan. 4, 1879.—A snow storm of three day's duration already, is yet in progress, accompanied with heavy wind from S. W. veering to N. W., and finally settling due W. Roads drifted full; business suspended. Thermometer, six to ten degrees below zero. Wheat at the beginning of winter in Ontario and Yates counties looked decidedly unpromising. The dry weather at the time of seeding, checked the growth of what was then sown, while many delayed sowing until October, on account of dry weather and fear of the fly, so that, on the whole, wheat has a poor stand, and only a favorable winter and spring can insure a full crop the coming year. L. D. F.

New Hampshire, Dover, Strafford Co., Jan. 3.—This town is situated on the Cocheco river, and is noted for its cotton manufactures. The soil in the valley is well adapted to the production of grass. The past season crops were an average, with perhaps the exception of potatoes. These are scarce and high—$1.00 per bushel. Hay is good and rather cheap—from $12 to $15 per ton. Beef is worth $5.50 and $7.00 per cwt. Corn is not raised here for sale, but even many farmers buy a good deal of it from the West, for which they pay from $1.10 to $1.20 per bag.

Ohio, Attica, Seneca Co., Jan. 6.—The cold is very severe here now, the thermometer generally keeping close to zero, and sometimes sinking from six to eight degrees below that point. Though an artisan and no farmer, I generally winter about 40 hens, and on an average they bring me from $40 to $50 a year over and above cost—not counting those we eat. I sell but very few chickens, but I sell a great many eggs in winter, when eggs fetch a good price. I am now selling from six to eight dozen per week, at from 18c. to 20c. per dozen. C. L.

Wisconsin, Evansville, Jan. 2.—Farmers hereabouts were right glad that bad weather delayed its arrival until the corn was all harvested, for it was so badly blown down by storms last September that otherwise it must have been spoilt before spring. Corn, oats and late potatoes yielded well. Early potatoes, however, were a failure. Fruit was a better crop than usual. Feed was good throughout the entire fall and stock is in excellent condition for winter. Corn is worth 20c.; oats, 15c.; wheat, 90c.; buckwheat, 40c.; pork, $2.50; beef, $2.00. There is no sale for poultry. G. A. B.

Wisconsin, Washotah Station, Jan. 6.—This place is about 30 miles west of Milwaukee on the St. Paul, Chicago and Milwaukee Railroad. The health of our people is good, though there are some cases of chicken pox among the children. Cattle, sheep and horses are looking in fine condition. Farmers, here at any rate, are all happy and prospering. There are good schools, good churches, and a good many good church-going people. H. F. S.

Maryland, Greensboro', January 7.—Last season I raised over 500 bushels of corn from six acres. The best yield from a single acre was 92½ bushels of shelled corn. I think I should have got over 100 bushels to the acre were it not that a heavy storm broke off a great many stalks and prostrated those not broken. W. C. S.

Illinois, Virginia, Cass Co., Jan. 6.—The mercury here is 18° below zero, snow a foot deep, sleighing splendid. T. J. N.

The Querist.

ANSWERS TO CORRESPONDENTS.

Dandruff and its Remedy.

J. E. D. P., Waverly, N. Y., asks whether washing the scalp with water in which salts of tartar have been dissolved, will remove dandruff without injuring the hair.

Ans.—It is necessary to explain the nature of "dandruff" before an intelligent answer can be given to this question. The whole external covering (epidermis or scurf skin) of the body is in a constant state of growth and removal. Upon the smooth parts of the body this takes place so readily and constantly, through washing and the friction of the clothing, that it is not usually noticed. But upon the scalp, the presence of the hair prevents this, and the scales of dead epidermis remain among the roots of the hair. In some people desquamation is much more rapid than in others, and these are they who are troubled badly with "dandruff". No external application will "cure" it. Anything that lessens the activity of the dermal, or skin circulation lessens its formation, and this occurs by changes of health or constitution. If any sort of "dandruff cure" chances to be used at such a time, it will be regarded as effectual. The wash mentioned above will do neither harm nor good. Cutting the hair short and washing the head frequently in soft water, with a little soap, brushing also frequently with not too stiff a brush are the best means of keeping the scalp free from dandruff. Fine combs and stiff brushes increase it by exciting the dermal circulation and producing irritation.

Alfalfa.

M. E. B., Ellenburgh Center, N. Y., wants to know if Alfalfa will do well as far north as Clinton county, and where he can get the seed.

Ans.—We have not sufficient data to warrant the belief that Alfalfa will prove a more profitable crop than the clovers or other forage plants in the above locality, though we have seen a small patch do well at Michigan Agricultural College, where the climate is as severe as in the above section. Letters in some of our "exchanges" also show that it has been successfully grown as far north as New Hampshire, and one man claims to have obtained a good growth in Ontario, Canada, but the seed did not mature in either place. It is preeminently a plant for warm climates and is grown extensively in the south of France and other countries of southern Europe. In California it is rated among the best forage plants, both by reason of its quality and profuse yield. We are told that in the Sacramento valley 40 tons to the acre during the year are not an unusual crop. The roots penetrate deep, thereby enabling it to withstand drought. To do well it must have a rich, mellow soil, as it fails alike on light sand and heavy clay. As experience is the best teacher, our advice is to try a small plot. Seed can be procured from any large seed store.

Plowing Under Manure for Garden Vegetables.

A. S. H., Elm Grove, Ohio Co., W. Va., asks which is the better plan for garden vegetables—to plow manure under in the fall or early winter, or to put it on after plowing in the spring and thoroughly stir up the ground then? 2. He also asks for a good plan of a lime-kiln for burning limestone?

Ans.—1. The experience of practical persons is almost universally in favor of applying manure in the fall to ground that is to be cropped in the spring. Field and garden culture differ from each other only in the intensity of the methods employed, so to speak; that is, the difference is only in the quantity of manure used and the labor applied, both of which, in garden culture, are the greatest that can be afforded. It is a well-founded principle in culture of the soil that the manure should be kept near the surface, for it is there exposed to the influences of warmth and the atmosphere. Thus the needed decomposition takes place most rapidly and the chemical reactions upon the soil itself of this decomposition are most effective. The rainfall dissolving the soluble portions of the manure, carries them down as rapidly as can be desired, in any case. If the manure is perfectly decomposed before it is used, it may be spread in the spring and then thoroughly mixed with the soil with the best results. Otherwise it may be applied in the fall or early winter and be covered in in the spring; and this latter method will be found most generally applicable both to the condition of the manure and the convenience of all persons. 2. See illustrated article to be published in next issue.

Founder (Laminitis).

J. W., Jr., Ingham Co., Mich., asks what is best to do for a horse that has been foundered and remains stiff?

Ans.—Founder is a disease that needs prompt and careful treatment, and if it receives it, the vast majority of cases will recover in a few days. This treatment consists of a good dose of physic, (four to five drachms of Barbadoes aloes) 30 drops tincture of aconite root three times a day, and hot poultices to the feet. This may, or may not be followed by nitrate of potassa, according to the condition of the animal. When such treatment is not given in time, however, a condition known as chronic laminitis generally results and this is much more difficult to remove than the former. The treatment recommended by Prof. Law is probably the best. A broad-webbed bar-shoe, beveled on its upper and inner surface, and thinner at the heels than at the toe, is applied; the hoof walls and soles of the feet are coated daily with hot tar, and gentle blisters are applied around the coronet. Owing to the displacement of the bone of the foot by the inflammatory exudation, the animal often remains tender-footed for life.

Plowing Buckwheat Under.

A Subscriber, Middletown, N. Y., asks:—1. whether it would pay to plow under buckwheat, green, and then seed down with winter grain; if so, is the season long enough to sow buckwheat twice and plow it under each time, and would it pay to do so; and if so, how early should it be sown the first time? 2. What variety of spring wheat would succeed best in his locality?

Ans.—In our opinion it would not be advantageous to sow buckwheat with the intention of plowing it under green on land calculated for wheat next fall. Two crops of buckwheat could undoubtedly be grown in a long season, but it would require very early sowing. We have seen buckwheat sown early and allowed to mature, then harvested and the stubble turned for wheat. We would give this mode the preference.

2. This question can be answered most correctly by the successful farmers of the neighborhood. It might be well to try Champlain and Defiance.

The Old-Man Cactus, etc.

S. L. R., Springfield, asks, 1, whether the Old-Man Cactus bears blossoms, and if so, what kind? 2, whether we have grasses for sale, and what is our price for them and the Old-Man Cactus?

Ans.—All Cactuses bear flowers. The blossoms of the Old-Man Cactus are comparatively insignificant, and seldom, if ever, produced on pot-grown plants,—at any rate so far as we know. But the oddity and beauty of the little fellows amply compensate for their shyness in blooming. They are advertised for sale by Mr. Louis Menand, Nurseryman, Menand Station, Albany, N. Y.; also, by George Such, South Amboy, N. J.; John Saul, Washington, D. C., and others, who likewise sell ornamental grasses. We absolutely *sell* no flowers whatever upon any consideration.

Daphne Cneorum—Hyacinthus candicans.

G. H. A., New Haven, Conn., asks, 1, does Daphne Cneorum have seeds? 2, what is Hyacinthus candicans?

Ans.—1. Yes; but so far as we have been able to observe, it seldom produces its small, round, white berries in this section of the country.

2. A very handsome summer-blooming species, a native of the Cape of Good Hope. The flower-stems rise to a hight of from three to five feet, and are terminated by many nodding white, Snow-drop-like blossoms. The bulbs should be lifted in the fall, kept dry all winter, and transplanted again out-of-doors in spring; in fact, they should be treated precisely like those of Gladioli, than which they are hardier

Sorrel-Tree and Hatchet-Leaved Arbor-Vitæ

T. D. Bristol, R. I., sends two numbered cimens of plants and asks their names.

Ans.—1. Oxydendrum arboreum—the Sorrel-tree or Sour-wood. It belongs to the Heath family and is a tree of much beauty, bearing white flowers in long, one-sided racemes clustered in loose panicles at the end of the branches of the season, in early summer.

2. This is Thuiopsis dolabrata—the Hatchet-leaved Arbor-vitæ—a tree from 40 to 50 feet in hight. Prof. Thunberg says: "A lofty, vast and beautiful tree, of all evergreens the fairest." It is notable for its flat spray, broad and blunt leaves which are green above and whitish beneath.

Inflammation of the Eyelids of a Horse.

T. B. Easton, Talbot Co., Mo., asks the cause and remedy for inflamed eyelids of a horse? The eye discharges matter.

Ans.—The data here given are insufficient to enable us to decide which of several causes or several forms of disease this evil must be attributed to. We would urge our friend to secure at once the services of a veterinary practitioner, as diseases of the eye are much more readily cured if attended to in good time, than if neglected for some weeks.

Miscellaneous.

M. W. G., Tecumseh, Mich., asks:—1. How early should a new cock be placed with pullets so as to insure a new strain of chicks to be hatched in April? 2. Would lime-water injure a Chinese Primrose or Calla Lily, when used at the root to destroy white worms?

Ans.—1. Two weeks will usually do, but perhaps three or four are better. With a good, strong, vigorous cock, impregnation will sometimes last from twenty to twenty-five days. Cases of this kind, though, are rare, the influence of the cock rarely lasting over seven to ten days.

2. No. Lime-water of ordinary strength is beneficial to plants. Unless very strong, it could do no hurt.

H. D. Lock Haven, Pa., says he saw lately in the Rural an advertisement of a watch claimed to be worth $12 but offered for $3, and also another advertisement of a new Russian model revolver, and asks if we know whether the goods are what they claim to be.

Ans.—We have seen the watches and think they are worth what is asked for them, namely $3. We should not advise any one however, to purchase three-dollar watches with the expectation that they will prove good time-keepers. The pistols we have also seen and used and they are as represented so far as we are capable of judging.

D. J. R. Sardis, Pa.—1. Sends a sample of oats and asks the name of the variety. 2. He also asks what is the matter with a Calla Lily that did well during the summer, but which has grown little, if any, since he brought it into the house, although the lazy thing has good soil, plenty of water, but perhaps too much shade, as it is out of the sunshine.

Ans.—1. We cannot name the variety from the sample. 2. It is taking a rest; give it less water and a little sunshine.

T. M. D., Milford, Del., asks the name of a first-rate work on farriery.

Ans.—Law's Farmers' Veterinary Adviser, price $3, contains the best and latest information on veterinary matters concerning the horse and all other farm animals. Of works exclusively on the horse, Mayhew's Illustrated Horse Doctor, price $3, is as good as any. Of works on horse-shoeing, Coleman on Pathological Horse-shoeing, $2, and Miles on the Horse's Foot, 75c., are good.

M. H., West Granby, asks the name and publisher of the best Atlas that can be got for $3 or $4.

Ans.—Harper Bros., of this city, are now publishing some fine works of the kind. Write to them for description of their New School and General Atlas.

Mr. N. W. McKinney, Texas, asks where can he get genuine Compton corn, and at what price per package or bushel?

Ans.—Of R. H. Allen & Co., or Thorburn & Co., of this city. Four dollars per shelled bushel.

Communications received for the week ending Saturday, January 11th.

W. V. A.—S. B. F.—D. M. S., we will endeavor to answer questions in due time. Seed distribution will not begin for a month at least—T. H. H.—J. G. A.—J. W. K.—S. E. M. K.—C. A. G.—T. P.—A. L. J.—M. THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, JAN. 18, 1879.

We will be pleased to send one or more copies of the RURAL NEW-YORKER *free to any of our subscribers sufficiently interested in its welfare to be willing to hand them to their neighbors for inspection. An intimation by postal card will suffice.*

Our readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to* THE RURAL PUBLISHING CO., *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

Our readers are particularly requested to read the particulars of our free seed distribution on p. 49, under publisher's notices, before ordering seeds.

Applicants for seeds will please observe that the postage on ANY POSSIBLE *selection of* TEN *sorts of seeds,* IS NEVER *more than* FIVE *cents. A* ONE-CENT *stamp suffices for any selection of ten varieties* EXCLUSIVE *of the Beauty of Hebron potato, Pearl Millet and Defiance wheat. If the first of these three is included in the list, then a two cent* EXTRA *stamp is needed, and if the second and third are included, an extra two cent stamp is also required.*

LARGE OR SMALL FARMS.

Among the questions frequently discussed at agricultural meetings and in the papers, is that of the comparative profits of large and small farms. It is a discussion equivalent to the canvassing, in a commercial assemblage, of the relative profitableness of a small or large store; or, among manufacturers, of the comparative advantages of a factory on a large or small scale. There can be no doubt that men have accumulated considerable wealth from a small commercial business, or by a manufacturing industry conducted on a moderate scale,—and also by the tillage of small areas of land. Industry and economy, conjoined with business capacity and a good acquaintance with the work in hand, will in time usually secure a competency in any avocation. By slowly laying dollar to dollar, with a shrewd investment of profits, a man can make himself independent, and even rich, doing but a very moderate business all the time.

For the majority of mankind this is the safest, and indeed the only practicable method. Out of a thousand men but very few have the natural capacity, or the acquired ability, to conduct any business successfully on a large scale. Napoleon declared that there were only two men in Europe who could handle an army of 100,000 men. A similar rule applies to every branch of human endeavor. And one of the chief elements of success is to know one's-self sufficiently well not to undertake more than can be successfully carried out. This applies as well to farming as to every other business.

But farming has never yet been a legitimate business in America. Land has been too abundant for that, as well as too rich with the accumulated fertility of ages. So far, we may say that there has been but little real farming done on this whole continent. When it comes to true farming—and it is now beginning to come to that in the older States—it will be necessary that a man calling himself a farmer should know something about his business, and be, to that extent, a business man.

As a business man his capacity for business will regulate the amount of business he will be competent to do. That, and the amount of capital he can control, will settle his status, whether as a large or a small farmer. And as farming is more and more conducted on business principles, the business of farming will divide itself into different classes. It will then become like other businesses, and as in trade there is a place for the large merchant and the small tradesman, so in farming there will be large and small farms, and all profitable in proportion to the capital and labor intelligently expended upon them for the production of salable crops.

When agricultural business is thus organized, it will be found, in many cases, that the area of land under tillage will not so much determine the profits as the amount of labor, capital and skill laid out in order to force the soil to its highest productive capacity. This, united with knowledge of the kinds of crops that are most suited to the market, an ability to forecast probable demand and prices, and a shrewdness in taking advantage of sudden turns of the market, will be the prime factors of success or failure.

Near large cities, or in places where prompt and ready transportation to large markets is obtainable, it may happen that a large force of men can be profitably employed on a few acres, the sales of products running up to tens of thousands of dollars annually. In this way a large business can be done on a small farm. It is now so done in many instances, and fortunes are acquired by skillful men from the tillage of five and ten-acre farms. As competition becomes closer and closer, only very skillful men, with a large cash capital, can run even such "little" farms successfully. But as yet there are many opportunities for intelligent young men of small means to "grow up" into such a business—more opportunities we should say, than there are men able and willing to take advantage of them.

But besides these "small farms" run at a high pressure for the production of fine perishable fruits and choice vegetables, flowers, trees, plants, etc., etc., there must also be farms of greater area for the production of breadstuffs, meat, milk and milk-products, wool, cotton, etc. Here also, as the pressure of competition increases and the money capital of the nation tends more to flow out into the country seeking investment there and satisfied with safe and moderate returns, the kind of earth robbery known as "scrub-farming" will cease by suffocation and starvation. It will not take a trained business man long to find out what it seems impossible to teach the "scrub-farmer," that there is no "business" and no profit in average crops of ten and twelve bushels of wheat, thirty bushels of corn, eighty bushels of potatoes, and other like returns per acre.

Similarly, the business farmer is not going to see any profit in cows so badly bred or so poorly fed, housed and managed, as to yield but 125 pounds of butter or 250 pounds of cheese in a season. Such a man is not going to rest a minute while ten or fifteen dollars per head on his neat stock and horses are wasted every year by the bad management of the manure. He is not going to lose the legitimate earnings of industry for want of proper implements, or the proper care of them, or by unskillful work in preparing land for a crop, or by poor seed, or by want of proper knowledge in the choice and application of manures. When farming becomes a business, with business men engaged in it, and a money capital proportionate to its requirements, we are going to see good farming become general. Then the ablest man, both in brains and money, will do the largest business in farming, as he now does in trade and manufactures.

EXTRAVAGANT HABITS.

One of the social wonders of the world in recent times was the ability and readiness with which the French people met the enormous tax or fine which their German conquerors laid upon them at the end of the last war. One thousand millions of dollars in cash were paid within a few months without any foreign aid and without any effort that was noticeable outside of France. The secret of this wonderful financial ability lay in the long-cherished and practiced habits of economy and saving usual amongst the French people. For years past, as to-day, that people have been simple in their habits industrious, sober, economical, and when they have a few francs to spare, they are carefully laid away. There is no eager grasping after large profits, large interest, usurious lendings, nor is there that eager desire to spend money as soon as it is possessed, that is common with us. Nor is it from avarice that the passion springs; on the contrary, it is a desire to possess some little competence, some store against a rainy day, that impels those people to exercise those virtues for which they have become noted and which are among their most conspicuous attributes on personal acquaintance with them. A son is to be sent to college or started on a small farm, the smallness of which would be ludicrous to an American, especially a Western farmer; or a daughter must be provided with her *dot* to start housekeeping with; and with habits of forethought cultivated for years and pursued with steadiness, there is no "cursed thirst for gold" for spending, but a careful husbanding for future needs. And this homely virtue saved the nation in a time of great disaster; and saves it every day from panics, collapses and frequent bankruptcies.

We might take a lesson from this. We labor and make money to spend, not to save. The desire to spend is innate. The child says, "when I have ten cents I will buy this or that with it." The man or woman in the same way has already laid out and spent hundreds of dollars in anticipation before it has been earned or he has come into possession of a tenth of the amount. This destroys thrift and creates uneasiness, discontent and dissatisfaction. It makes our every-day plodding life unwelcome to us. Our boys inheriting it, crowd to the cities to seek a rapid fortune, and our girls dream uneasily day by day of a better position. Society is to some extent debased by it. It is through this that sheriffs have been enabled to retire on a competency after two or three years of official life, gathering together the lost fortunes of hapless debtors ground between the millstones of the law and exacting creditors. And still we are getting no better! The hard times, now happily past we look at with revengeful feelings, and hail the better times at hand because those kept us poor and these promise to make us rich.

What a land and what a nation this would be if we could but engraft upon ourselves some of the French habit of economy and thrift; if, when we made a hundred dollars, we could be content to let it remain in safe-keeping without trying to double it by usury or speculation, or use it for some more noble purpose. Compare the last fifteen years of our history with the same period in French history, and it will be found that the greater part of our financial difficulties have arisen from our want of the French habits referred to.

MALARIA.

We have always thought that people might live in what are now known as "malarial" districts and yet escape the liability to malarial diseases by avoiding the out-door night and morning air. The following is a conversation between the writer and one of Brooklyn's (N. Y.) most distinguished physicians:

Q. Suppose a person remains in the house until the sun is well up in the morning and is careful never to go out after the sun begins to lose its power in the afternoon, is he liable to malarial diseases?

A. Yes. The liability to such affections can not be escaped.

Q. Then he may disregard the night and morning the same as the mid-day air?

A. No. Malarial affections assume many different forms. It depends upon the health, strength—upon the "constitution," as it is called, of the person—in which form the disease will manifest itself or whether it will manifest itself at all. All other things being equal, a person avoiding the night and morning air, might resist the disease, while if he exposed himself to it, he might be unable to do so.

Q. Then the heat and confined air of the house do not kill the malarial germs?

A. The air in and about the house is the same. Changes out-of-doors are quickly felt in-doors. The malarial germs are deadened—baked so to speak—after a while, but a fresh supply is always at hand.

Q. Then there is no way of living in a malarial district and of being secure against one or the other forms of malarial affections.

A. No. The precaution you speak of merely lessens the liability to, as well as the virulence of, the attack. The enemy is there all the same, but he is not so strong or aggressive.

A DIFFERENCE OF OPINION.

We have several times referred to the Climbing Hydrangea as a "new" vine that was likely to excite a good deal of interest. The impression has been made that it would probably bear huge panicles of flowers, like the now well-known hardy Great-panicled Hydrangea of which the RURAL has said so much—and this alone was enough to have insured it a ready sale.

In the Gardener's Monthly of January, Prof. C. S. Sargent says: "Too great expectations as to the horticultural value of this much-heralded plant will, I fear, only lead to greater disappointment — — and if it is new to gardens it is only because it has never seemed worth introducing into them before. The foliage is by no means striking. The individual flowers are small and arranged in loose, long-branched cymes, but without any of the showy sterile flowers which make Hydrangeas desirable garden plants." So much for Prof. Sargent's opinion.

Mr. Peter Henderson says in the same journal: "Like Hydrangea paniculata—that grandest of all our hardy shrubs—I think it very probable that when once established, the Schizophragma Hydrangeoides"—that is its charming botanical name—"will prove to be one of our finest hardy climbing plants."

It seems that the plant is hardy and that it propagates readily from seeds, but slowly from cuttings. But its hardiness is of little value if it has no beauty, and the less we propagate it the better. We are much opposed to the dissemination at a high price, of "new" plants that are not worth a place in our gardens even if they did not cost anything. Anybody can do better in the field or woods nearest to him.

BREVITIES.

A WEED may be defined as a plant that one does not want.

Among new tuberous-rooted Begonias there will soon be a double yellow in the market.

The best thing in the world to buy, if one is sure of a good article at a low price, is experience.

How to make Americans eat more cheese and to demand it of better quality and lower price is the problem.

Our picture of Pinus ponderosa var. pendula, is taken from the London Gardener's Chronicle of a late date.

There is no doubt that the Japan Persimmon is a success in California, and there is no doubt it is *not* a success here.

The growing of Havana leaf instead of Connecticut seed-leaf tobacco is strongly advocated by the convention of Connecticut Valley tobacco growers.

Erianthus Ravennæ and Eulalia Japonica Zebrina.—Of all hardy grasses of which we have knowledge, these are the best. We advise our readers to procure them next spring.

We have already spoken of Grindelia squarrosa as a valuable remedy for chills and fever. Its near relative, Grendelia robusta, is now used as efficacious in asthmatic and other bronchial affections.

The California Horticulturist.—We are pleased to see that Mr. Charles H. Shinn has become the editor of the above magazine. He is a generous-hearted man and a horticulturist by nature, education and practice.

Many of us know that Asparagus will stand a good deal of salt. Who knows from experiment that salt benefits Asparagus? That is, of two plots treated the same in every other way—will the one that is salted yield more or better Asparagus than the other?

Two men talking politics: the poor man is clamorous for more greenbacks; the rich man is equally stubborn for gold; both appeal to an impecunious stranger standing by for his decision. With stupendous gravity he replies. "I'm for unlimited issue—then I may get some of it; but if the issue is contracted, it won't make no difference to me whether coal is five dollars or ten cents a bushel."

We call attention to the Youths' Department this week. We want our young friends and their mothers and fathers to take more interest in this Department than heretofore. We cannot do this Department justice without their aid. Young folks want to be entertained as well as instructed through reading. Nobody is better fitted to do this than parents themselves.

We see that Pearl Millet is being offered by the trade at 60 cents per pint. This is a very high price but it is less than we supposed it would be offered for. We want all of our friends to try this fodder plant from the seeds we offer them for the asking, and to report next fall upon the results whatever they may be. We shall begin to send out our seeds to subscribers before March.

A distinguished gentleman of the West writes us: "If forestry concerns any class of people on the American continent, it certainly does the hundreds of thousands who have moved into the great plains during the past year. Can there be anything done by us to give this work the right direction, or must it drift on without any direction?" An article on the subject from him, signed Frontier, will appear next week.

Gold Neglected.—The return to a specie basis caused scarcely a ripple of excitement here in the financial capital of the country. Instead of the predicted rush to exchange legal-tender notes for gold on January 2, the first day of actual resumption, on that day the sub-Treasury in Wall street paid out for such notes only $130,000 gold, while it took in $400,000 gold in exchange for paper. Since then from four to five times more gold has been received for notes than has been paid out for them.

From all we have read and from all we have learnt from experience, we have no doubt that moles not only prefer animal food but that they would die upon an exclusively vegetable diet. People taking the opposite view, say in proof of it, that moles go from hill to hill, from plant to plant. "Why do they do this if not to feed upon the roots?" "Because," we answer, "more animal food (generally earthworms) collect in rich soil than in poor, and the earth is generally made richer about the roots of plants than elsewhere."

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

IRISH AIR.

THE AUTHOR OF "SONGS OF KILLARNEY."

"'Twas pretty to be in Ballinderry."

'Twas pretty to be in Ballinderry,
'Twas pretty to be in Aghalee,
'Twas prettier to be in little Ram's Island,
Trysting under the ivy tree!
Och hone, ochone!
Och hone, ochone!
For often I roved in little Ram's Island
Side by side with Phelimy Hyland,
And still he'd court me, and I'd be coy,
Though at heart I loved him, my handsome boy!

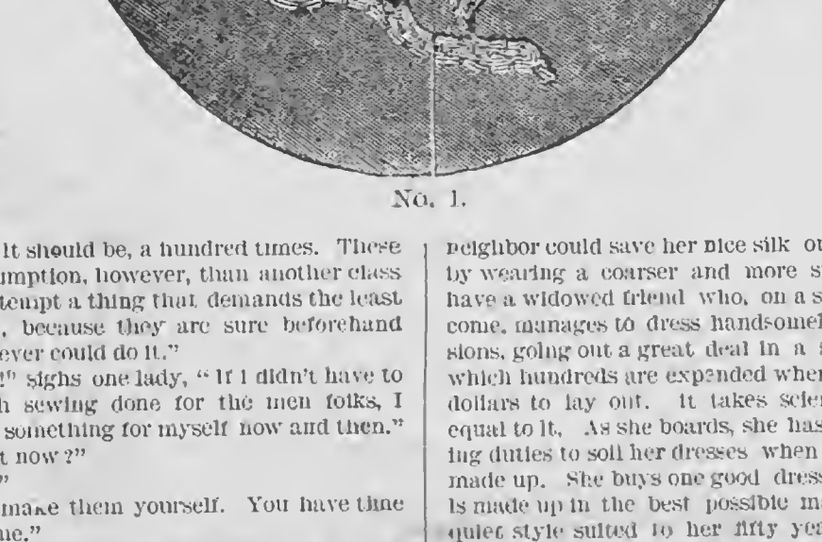
"I'm sailing," he sighed, "from Ballinderry
Out and across the stormy sea.
"Then if in your heart you love me, Mary,
Open your arms at last to me."
Och hone, ochone!
Och hone, ochone!
I opened my arms—how well he knew me!
I opened my arms and took him to me,
And there, in the gloom of the groaning mast,
We kissed our first and we kissed our last!

'Twas happy to be in little Ram's Island:
But now 'tis sad as sad can be:
For the ship that sailed with Phelimy Hyland
Is sunk forever beneath the sea.
Och hone, ochone!
Och hone, ochone!
And 'tis oh! but I wear the weeping willow,
And wander alone by the lonesome billow,
And cry to him over the cruel sea,
"Phelimy Hyland, come back to me!"

[*Good Words.*

CHINESE EMBROIDERY.

THE cuts at Nos. 1 and 2 are a center and border for a circular cushion or mat, done in Chinese embroidery. The foundation of the cushion is ruby satin; it is worked with gold thread and black embroidery silk. The method of working Chinese embroidery may be clearly seen in the cuts; the gold threads are laid on the design and caught down at intervals with a long stitch of black silk; a line of back stitches in black silk is worked round the outline of the center and in a few parts of the border, a portion of which is shown in No. 2. In order to complete the tracing of the circular border, trace first on one side of the tracing-paper and then on the other, matching the pattern at the broken line shown in the cut.



No. 1.

GUMPTION.

MRS. A. E. STORY.

NOT a high-sounding word, perhaps, but a very expressive one, is Gumption. A man had better be born with a good stock of gumption in his cranium, than with any amount of money in his (prospective) trousers' pocket. Many a man has let a fortune slip through his fingers for the want of it, and many a woman who might have clothed herself in purple and fine linen has been content to wear sixpenny calico for the same lack.

Gumption in the small, every-day affairs of life is more than any other quality—the one thing needful. Webster makes this word to mean: capacity, shrewdness, address. It is all this and more. What word have we that can quite express its full meaning?

If we see a man drawing out manure on a stone-boat, or wheeling it on a barrow, or damming a muddy brook to wash his sheep in, instead of driving them half a mile to the river, or lifting heavy barrels into a wagon instead of rolling them in, or cleaning his field of stones by carrying them off in his hat, or mowing the thistles in his pasture after they have gone to seed, or letting his mowing machine stand out in the weather, while his home-made contrivance for marking out even ground stands under cover, or cutting off a cow's tail to cure her of hollow horn, we are apt to say he is lacking in common sense, but it is only gumption he lacks.

A woman lacks it when she plants small flower seeds in the same way as her husband does melons and corn; when she tears her dresses into rags for her new carpet, because they are "just the color she wants;" when she spends all her spare time piecing bed quilts and lets her children run the streets, dirty and unraught; when she cans fruit in cracked jars and expects it to keep; when she lets her husband go abroad in patched overalls and collarless shirts, and then wonders he don't get into the legislature; when she tricks her daughter up to "catch a beau" before she is fairly in her teens; when she "talks" to her neighbors about her husband, and then can't understand why he is slightingly spoken of, when she allows her sons to call their father the "old man," and then is ready to cry her eyes out because they call her the "old woman;" when she keeps her children's stomachs stuffed with rich cake, pies and pudding, and then sends them to bed at night with their faces done up in lemon juice, to make their complexions clear; when she discards a lover because he has a wart on his nose and marries a dandy with a nose the color of a beet.

Some people go through life without being able to do anything they undertake, except in the clumsiest manner, and yet they have seen the work done as it should be, a hundred times. These have more gumption, however, than another class who never attempt a thing that demands the least taste or skill, because they are sure beforehand that they "never could do it."

"Dear me!" sighs one lady, "if I didn't have to hire so much sewing done for the men folks, I might afford something for myself now and then."

"What is it now?"

"Overalls."

"Why not make them yourself. You have time and a machine."

"Oh, I never could. I tried it once, and when John came to put them on he couldn't wear them, because I'd sewed the fronts together for one leg and the backs for the other."

Another lady wants to go on an excursion "dreadfully," but cannot afford it.

"Fix the hat you are going to take to the milliner's yourself. It wants nothing but what you can do."

"I wouldn't dare undertake it for the world. I should ruin it."

"Then make over your dress and save the dressmaker's bill."

"Oh, you could do it, I dare say; but I can't. If I ripped it to pieces, I should never be able to get it together again."

One of the worst things about women of this sort is, that they are forever blaming some one else for what they are to blame for themselves. Do they want to get along and up in the world—and often they are ambitious in this respect—they are not slow to see that somebody doesn't manage right, but never think of taking the blame to themselves. They haven't gumption enough for even that.

FIRST, SECOND AND THIRD BEST.

J. E. M'C.

I WISH that every young lady of limited means, in the country, might read the excellent letter of Margaret B. Harvey, "on dress," in a late number of the RURAL. It would also suggest many good ideas to girls who have considerable money to expend on dress every season. We all know how money can be frittered away on most unsatisfactory purchases, because we set out without a clear, fixed purpose a definite idea of what we wish to get.

Not only is it a very excellent plan to have one really good dress, but it is also equally important to have a good second best to save it. Many poor women destroy a best dress by wearing it at unsuitable times, simply because they have no other presentable on in which to go out. A richer neighbor could save her nice silk on a rainy day, by wearing a coarser and more suitable suit. I have a widowed friend who, on a small stated income, manages to dress handsomely on all occasions, going out a great deal in a social circle in which hundreds are expended where she has but dollars to lay out. It takes science, but she is equal to it. As she boards, she has no housekeeping duties to soil her dresses when they are once made up. She buys one good dress a year. This is made up in the best possible manner and in a quiet style suited to her fifty years. This is set aside as her very best, for dinner parties, sunny Sabbaths and the like. The last year's best dress is remodeled into an excellent second best, which is the most used of the set. It serves for afternoon wear, for general street wear, and dull Sundays. Then comes the third best which is made, most likely, of several old dresses, ripped apart and turned to the best account. This is for very common use, but looks well even on the street, for the materials of which it is made were of the best, in their day, and such goods have a perennial youth. The other accessories of her toilet are always elegant, though I should hesitate to tell you how long they last, for fear you will discredit my whole statement. It does seem as if Aunt E's things never did wear out.

Another hint, dear girls, save even the little pieces. Roll them up smoothly and lay them away in some safe place. A friend who buys an elegant outfit at Stewart's every season and has these twenty years, saves every scrap of her silks and rich dress goods and all the odds and ends of trimmings, laying them away carefully in boxes. Her supplies, when re-making her own or her little girl's clothing, seem inexhaustible. Wastefulness generally, is no mark of high breeding or refined culture, but quite the reverse.

THE RURAL of Jan. 25 will contain description and cuts of fancy lingerie.

No. 2.

CLUB NOTES.

ALL contributions for the Club must reach this office by the 20th of the month. The Club meets the first week in every month, and all subscribers are privileged to send contributions to it

Literary Miscellany.

I HAVE DRANK MY LAST GLASS.

No, comrades, I thank you, not any for me;
My last chain is riven, henceforth I'm free,
I will go to my home and my children to-night,
With no fumes of liquor their spirits to blight:
And with tears in my eyes I will beg my poor wife
To forgive me the wreck I have made of her life.
"I have never refused you before;" let that pass,
For I've drank my last glass, boys,
I have drank my last glass.

Just look at me now, boys, all rags and disgrace,
With my bleared, haggard eyes, and my red, bloated face!
Mark my faltering step, and my weak, palsied hand:
And the mark on my brow that is worse than Cain's brand.
See my crownless old hat, and my elbows and knees,
Alike warmed by the sun or chilled by the breeze;
Wh , even the children will hoot as I pass—
But I've drank my last glass, boys,
I have drank my last glass.

You would hardly believe, boys, to look at me now,
That a mother's soft hand was once pressed on my brow,
When she kissed me, and blessed me, her darling, her pride.
Ere she lay down to rest by my dead father's side;
But with love in her eyes she looked up to the sky,
Bidding me meet her there, then whispered "good-bye,"
And I'll do it, God helping! Your smile I let pass—
For I've drank my last glass, boys,
I have drank my last glass.

Oh! I reeled home last night—it was not very late,
For I'd spent my last sixpence, and landlord's won't wait
On a fellow who's left every cent in their till,
And has pawned his last bed their coffers to fill,
Oh! the torments I felt, and the pangs I endured!
And I begged for one glass, just one would have cured,
But they kicked me out of doors! I let that too, pass
For I've drank my last glass, boys,
I have drank my last glass.

At home, my pet Susie, with soft, golden hair,
I saw through the window, just kneeling in prayer;
From her pale, bony hands, her torn sleeves were strung down,
While her feet, cold and bare, shrank beneath her scant gown;
And she prayed—prayed for bread—just a poor crust of bread,
For one crust, on her knees, my pet darling plead;
And I heard, with no penny to buy one, alas!
But I've drank my last glass, boys,
I have drank my last glass.

For Susie, my darling, my wee six years-old,
Though fainting with hunger and shivering with cold,
There, on the bare floor, asked God to bless me;
And she said: "Don't cry, mamma, he will, for you see,
I believe what I ask for!" then sobered I crept
Away from the house; and that night when I slept,
Next my heart lay the pledge—you smile, let it pass,
But I've drank my last glass, boys,
I have drank my last glass.

My darling child saved me; her faith and her love
Are akin to my dear sainted mother above;
I will make her words true, or I'll die in the race,
And sober I'll go to my last resting place;
And she will kneel there, and weeping, she will thank God
No drunkard sleeps under the daisy-strewn sod,
Not a drop more of poison my lips shall e'er pass,
For I've drank my last glass, boys,
I have drank my last glass.

GRETCHEN'S SONG.

EBEN E. REXFORD.

GRETCHEN'S home, in the Fatherland, was under the shadow of the great pines, standing tall and stately, like soldiers, on the mountain-side. Franz said he could hear voices in them all day long; and the voices were always there in the night time plainer to be heard than through the day.

Franz was Gretchen's lover. She was his only friend. His only one? Ah, no! I was mistaken in saying that. He had one other, and that was his violin. Such music as he could coax from th wonderful instrument One moment Gretchen would cry over it. The next he would make her laugh, and before she knew what she was about she would be dancing as she listened.

"Ah, there must be a living soul in it!" she said, "I am half afraid of it, Franz."

"But you are not afraid of me, Gretchen?" Franz would say, and smile softly to see her flax-flower eyes droop, and the red come out in her cheek. "Surely, you are not afraid of me?"

"No," she would answer, and then Franz would say "Listen, Gretchen, and hear what the soul in the violin tells thee," and he would play little harmonies so low and sweet that they seemed like angel voices far away. What another would have said in words, he made his violin say for him. It was the strangest, sweetest way of wooing Gretchen had ever heard of, she thought. How pleasant to be the sweetheart of such a lover as Franz, who could put his thoughts into the most beautiful lan-

guage on earth, and sometimes she thought there could be nothing sweeter in Heaven.

By and by another lover came a-wooing. He was the son of a rich man in the village. He was proud, though just what he had to be proud of Gretchen could not understand. He could not play like Franz. He could not sing such strange and charming songs as Franz could. He seemed to lack so much, she thought, when she compared him with her lover. His father had money, and was the great man of the place, but that was nothing to be proud of. It merely happened so. This young man had never done anything to make himself or any one else better. No one was the happier because he lived. She thought no one ever would be, because, you see, she loved Franz, and on that account liked this new lover not at all, and used to laugh at his music and his shy, strange ways.

"I would not marry him if he had the world to put in his pocket," said Gretchen. "You are richer, with your music, Franz, than he with all his father's wealth."

And then Franz made his violin sing the sweetest, and the saddest little song. She smiled to listen, and felt the tears coming at the same time. She knew afterward, what he was thinking about then.

Gretchen's father wanted her to marry her rich lover.

"I cannot do it," she said, firmly. "Don't urge me, father, for it can never be."

"And why?" he asked.

"For many reasons," she answered. "I do not love him. I never could. That is one, and that is enough. Send him away, father, before I learn to hate him."

"I know why you will not listen to him," her father said. "It's because of that Franz. The good-for-nothing, idle fellow! I'd like to break that violin of his over his head. Now, listen to what I say, Gretchen. If you will not marry the man I want you to, I will never consent for you to marry Franz. Remember that."

He left her, and she sat down by the window of her little room and cried for a long time. She could not marry Franz against her father's wishes. She must give up her dream,—but she would not forget him or be untrue to him. She would love him if she lost him.

"You had better do as your father wants you to," Franz said, bitterly. "I am only a poor musician, and he will never take back his words, be sure of that."

"But I can wait," she said, and her face was brave and beautiful to see.

"Ah, but the waiting may be so long!" Franz said. "Have you thought of that?"

"I can wait all my life, if need be," she said, and he knew she meant every word.

By and by Franz made up his mind to go to America.

"I can work there better than here, may be," he said. "And it will be just as easy to wait there as here."

Before he went away he made a little song for her. It was such a sweet and tender one that, though he only sang it once, she forgot not a word or a note. Gretchen had never heard anything like it before, and she saw in it another proof of her lover's genius.

"Oh, it is so beautiful, Franz," she said. "The angels must have sung it to you."

"You think it is something wonderful because you love the one that made it," he said. "It shall be your song and mine, Gretchen, and I will sing it to no one else."

What long and lonesome days those were that came after Franz went away! It seemed as if waiting for a year or such ones would make an old woman of her. And they might have to wait so many years—but she would be true forever. Brave, noble little Gretchen!

The years came and went. No more lovers came to woo. They knew that her heart was over the sea with Franz. Once in a while she heard from him. He was waiting, like herself.

By and by her father died, and then Gretchen was free to go and come as she pleased. She was free to marry the man she loved, and she would find him in that wide, new world, and make her promise true.

But where to go she did not know. When last she heard from him he was traveling about the country with some German singers, and he might be east or west, or north or south. Perhaps—and when she thought of that her heart seemed to stop beating—perhaps he might be dead. Who knew? Stranger things happened every day in this world of ours.

But she would seek for him. She left her home and crossed the sea to the shores Franz had sought before her. He had come to New York. She would begin her search there. And she began it, and it ended fruitlessly. If he had ever been there they had forgotten him.

Then she went to other cities. Wherever she heard of any German singers, there Gretchen sought for her lover. But he was not among the roving minstrels. He seemed to have dropped out of existence. He had gone down in the great whirlpool called life, and she was alone, she feared.

But she was not the woman to give up her search and sit down hopelessly. "No news is good news," they say. So long as she heard nothing of him she could hope. And while hope lasted she would search for him.

So she went hither and thither—east and west, and north and south. She listened to the violins in many an orchestra, hoping to hear his among them. She did not care to see the players. That was not necessary. She would recognize the voice of his instrument when she heard it. But she listened in vain.

So a year went by and at the end of it, she found herself in a great inland city, with money almost gone and courage sinking low. How was her quest to be kept up longer? She could work, but when her work her search could not go on.

"Oh, my Franz!" she said sorrowfully, as she leaned her head upon the window-s that night, and listened to the roar of life as it surged to and fro in the streets below her. "It may be we have been near each other, and yet are never to meet again. It may be thou art dead. But thou hast not forgotten me, wherever thou art."

So beautiful and strong is loving woman's faith!

By and by the babel of life grew still. As she leaned out in the moonlit air, the impulse came to her to sing. Ah, it had been long since she cared to do that! And she sang—sang the little song Franz had made for her. Soft and low, at first, with a quiver in it, as if her sorrow haunted its notes and could not be shaken off; then, as the memory of the old times came back, and she thought of Franz, playing under the shadows of the pines, and seemed to hear his violin again, speaking to her like a voice out of Heaven, and falling like a balm upon the unrest of life, her song grew clearer and sweeter, and the night was like a great soul that listens in its stillness.

The song ended. Then from a window high up in the great tenement-house opposite, came the sound of a violin. It was like a voice that cries out in gladness that is almost unutterable—gladness so deep that it is half a pain. The long, tremulous tones came floating to her on the wind, and a voice in each chord seemed calling, calling, while over and above the voice a melody wound itself like a vine that is full of beautiful flowers.

"Oh, my Franz!" cried Gretchen, while her face was pale with sudden joy. "Oh, my Franz! I have found thee! That is thy voice speaking to me. Thou hast not forgotten thy song, and now thou art answering it."

Down the long stairs and across the street she flew like a bird that hears its mate. Up the stairs of the house in which Franz dwelt her feet climbed swiftly. Love lent her wings, and her body seemed light as her heart. Her soul kept crying, "Franz, I have found thee at last."

"Gretchen, is it thou?" It was Franz's voice, in the language of the fatherland, that spoke when her feet were at the door.

"It is thy Gretchen," she cried, and then he saw her at the doorway, with the light of woman's love shining in her face, and he dropped the violin, stretched out his hands toward her with a rapture too deep for words in his poor, pale face.

"Oh, my Franz!" and then her arms were about his neck, her tears and kisses mingled on his face.

"I had thought that I must die without seeing thee again," he said. "But it seemed as if I could not. It will not be so hard now, since thou art here to hold my hand."

"Thou must not say that, my Franz," she said, and her eyes were so full of tears that she could no longer see his face. "Thou must live for me."

"If I could," he whispered. "But I fear it cannot be. Even love like thine is not strong enough to conquer death."

"Bring me my violin," he said. And she brought it and raised him up in bed, so that he could play. He touched the strings softly and lovingly, in low, uncertain chords. Presently they fashioned themselves into the melody of the song he had made for Gretchen. Oh, it was so sweet, so sad. She felt the tears falling down her cheeks like rain.

All at once the violin fell from his hands to the floor, and a string snapped apart with a sound that was like a sharp cry of pain.

"It is the end, Gretchen," he said, faintly. "Let me hold thy hand, dear, and will thou kiss me?"

She bent above him and drew his head upon her breast, and kissed his thin, cold cheek. A lonesome wind was blowing through the room and smote against his forehead.

"Ah, the pines!" he cried. "Dost hear them, Gretchen? They are talking to me."

And then such a far-away look came into his eyes that she felt as if an infinite space was between them. And when she called his name, and he answered not, she knew that it was the space of death.

A WORD ABOUT ACTRESSES.

THERE is hardly a village in the land so obscure, or so small, but what has in it at least one young girl who is ambitious to become an actress.

In imagination, she sees herself the center of admiring hosts, the possessor of a heavy bank account, and the mistress of no end of superb costumes. The road to success seems very easy, and she reads with a thrill of envy of the adulation which is lavished on popular Miss Davenport or Lotta, and despising the uncongenial housekeeping or teaching, she sighs for an opportunity to become an actress. A writer in Lippincott's Magazine for January has done a wise and kindly thing in showing a little of the harsh reality which lurks beneath the romance of stage life. We give the article, hoping it may be the means of curing at least one girl of her desire to forsake the quiet of home for the glare of the footlights, and the temptations which beset the life of an actress.

"The stage is crowded with female aspirants of a good figure, some beauty, an irreproachable taste for the most expensive costumes, and no genuine talent.

Many young girls of wealthy families have sought the career of an actress from a powerful impulse toward the excitements of such a life. Still, judging from the meagre results which follow the indulgence of their inclinations, I infer that the stage appears to these ambitious ladies merely as an arena for gaining more general admiration than they could in private life. There is small capacity for any kind of fervid feeling in their hearts or minds; there is little of that singleness of purpose which is a requisite for any excellence in art, and which must take its line absolutely from a shaping instinct more powerful than any external circumstances. The comparative success of such actresses seems to the uninitiated to open an easy road toward a fictitious and brilliant life, and on every side we see young girls undertaking it without any idea of the preliminary hardships or any realizations of the thousand impediments in their way. Their idea of an actress is of a charming, graceful creature whose life is passed between the enjoyment of private incense and public applause; and by contrast with the prose of their every-day existence, and the enfeebling strain of effort to reach the demand for thoroughness and hard work in any other line of occupation, a sort of glamour is thrown over the stage.

Let us see what are those inducements which justify so many young ladies in aspiring to a theatrical career without the possession of talent which can ensure success. In the first place, they exchange the security of a retired and guarded life for a publicity which rarely becomes either celebrity or reputation. Generations of light women have made the name of "actress" a synonym for the worst faults of the sex; and let a girl once appear behind the footlights, be she chaste as ice, pure as snow, she cannot escape calumny. This is, of course, cruel injustice, and does great wrong in a hundred cases. Still, no one thinks of denying that the majority of the profession lead lives which separate them from their more scrupulous sisters. Thus, the very fact of a girl's becoming an actress induces a doubt of her possession of the traits most pleasing in women. Let her remain absolutely immaculate, she is yet jostled against women whose character she knows to be more than dubious; she becomes familiar with the idea of vice—is quick to learn that in the life she has entered one cannot be over nice and particular. It requires the loftiest ideals or the genuine impulse of a severe and conscientious pursuit of perfection in art not to suffer an indescribable lowering of tone from this constant association.

Another point is this; Nothing is so important for a mediocre actress (and we are writing of no others) as the matter of costume. Even with a continuous engagement it is impossible, with the salary paid to second-rate professionals (ranging from fifteen to forty dollars a week, and this often tardy in payment, sometimes wholly forfeited by failures of the management), to provide the rich and varied dresses now demanded at all the leading theatres. Thus, a young actress dependent on her salary and without an accumulated wardrobe to fall back upon, finds herself obliged to compete with others whose extravagance scarcely has a limit—who may, if it suits the play, indulge their love of dress by appearing in no less than six or seven toilettes of the most superb description. In certain theatres some of the costumes are given by the managers, but any actress will assure the novice that very few even of the "leading ladies" in the profession can properly dress their parts on their salary.

We have so far spoken only of the difficulties the young and obscure actress must contend with after she is launched and has a secure engagement, while the fact is, that it is well nigh impossible for her to obtain any footing at all on the stage, every entrance is so overcrowded. Getting an engagement at first seems practicable; after a few failures it becomes a weary experience. Promises are made only to be broken; hopes are held out which but the more cruelly light up the blank negation of the realities. To sit with a manager for two hours in the morning is to gain an idea of the numbers of aspirants to whom an engagement is a matter of vital interest, of actual necessity. Women of every age, from the round-faced girl of sixteen to the pale, worn creature of forty, come in to inquire if Mr.——has anything for them that morning; it is a dreary round, and to many a perilous one. Few illusions remain to the neophyte after toiling for weeks in this way without seeming near to the goal.

The goal once reached and an engagement made, the insecurity of things in general becomes manifest. On the stage, as everywhere else, if you make yourself essential—if you act so well that your playing of your part is an indispensable guarantee of the success of the drama—there is little danger of your losing your engagement. But few can adapt themselves to their roles with that fine fitness which precludes the idea of any one's doing it better. Hence, the young actress finds herself constantly in danger of being superseded. The green-room is full of cliques whose jealousies are of the most creeping and venomous kind, and a novice—and, above all, a novice whose standard of taste and morality seems disagreeably high—is a person to be got rid of if possible. At a time when the young actress needs the most friendly support, the most tender patience and the most generous encouragement she is liable to be fretted and disheartened by a course of systematic cruelty on the part of some older professional, who perhaps has taken a dislike to her—perhaps wants her place for a friend of his or her own. The generosity of actors and actresses has become proverbial, and apparently no class of people stand by each other so consistently; yet it is nevertheless true that in no other profession (unless we except the musical) can there be waged a more deadly internecine war. Thus, an engagement is often cancelled on a mere pretext, and the young actress finds the ground cut away from beneath her feet. And she has no redress. Her having been allowed a place in the play at all was a miraculous piece of good-nature on the part of the management, for which she was too thankful to allow of her making provisions of safety.

A continuous engagement for eight months of the year is one of the rarest pieces of good fortune, and rarely enjoyed by any save actresses of real ability. Few expect to do better than be employed in companies whose lease of life depends upon the success of tours into the provinces. Most of these end in failure, and payment for services rendered is often delayed, and sometimes, it is to be feared, altogether repudiated. What then becomes of the young actress out of an engagement, the entrance to every theatre barred for that season, unless some lucky accident opens an unexpected chance? It is on this chance that half—perhaps two-thirds—of one class of actresses live.

A feverish life it is too—of suspense, tortured by constant fluctuations of hope and despair; almost certain to be hampered by debts; exposed to every sort of humiliation, in which sympathy and promises of aid are rarely anything save a source of unexpected danger; the energies which unfavorable circumstances sometimes beget are chilled when resolutions of independence and high purpose find themselves powerless before petty alternatives, each repugnant to heart and mind.

This fictitious, elegant life of splendid living, rich dresses, waiting audiences, brilliant successes is, except to the possessor of rare talent or undoubted genius, the poorest, tawdriest, least worthy existence a woman can honestly live. It is, too, a life resting on a basis which renders the perceptions dulled and deadened to the finer uses and aspirations of womanhood—in which shadow is better than substance, tinsel than gold, and falsehood than truth."

X.

WEAKER THAN A WOMAN.

CHAPTER XXV.

From that day a change came over Felix Lonsdale; he went home even that same evening an altered man; he opened his heart to the love and sympathy that Katie showed him.

He did not suffer less—but it was in another fashion now. He worked harder than ever; he said to himself that if it were possible he would drown his sorrow in the hardest work he could find. And yet he did not know the worst; he only knew that Violet had broken her promise, and declared it impossible to marry him; he had not the faintest notion that there was really any wealthy lover at hand. He believed firmly that her parents had talked to her and argued with her until she had been overruled by them. Still, all Lilford—all but himself—knew that Violet was going to marry Sir Owen; it had been kept quite secret for some time, but now the day was fixed—the fourteenth of September—and there could no longer be any secrecy.

The whole place was in a ferment over it. There was to be a grand dinner given to all the tenants, to all the servants and dependants; and the bell-ringers had been told how many times a merry peal was to be rung on the old church bells, in honor of the bride and bridegroom. The only persons who knew nothing of all this were the inhabitants of Vale House—the invalid father who saw no one but the doctor and Eve Lester, the kindly industrious young step-mother, and the young lover himself. No one cared to speak to them on such a subject, and they were the last to hear of it. Even Evelyn, who never shrank from trouble, shrank from speaking to them about it.

Felix wondered one night, when she came to Vale House, why she was so kind, so tender and compassionate to him, why she hovered round him like a mother over a sick child, why she spoke such low earnest words to him—so noble, so beautiful, that his whole soul was stirred by them.

"I had almost begun to fear that there was something fresh concerning that unfortunate will," he said; "people have been so strange with me. It cannot be my love-story; no one knows that. People all know, of course, that Violet has gone away to London; but I do not think any one out of our own household knows that she has broken with me."

Eve could not tell him; she could help him, she could strengthen his heart and his mind, but she could not look at him and say, "To-morrow will be Violet's wedding-day." She turned away sick at heart that she could not take the whole burden upon herself and suffer for him. She was brave enough, but she could not say to him, "The girl for love of whom you are breaking your heart thinks so little of you—so little of your pain—that she is going to marry to-morrow the man above all others whom you dislike."

She talked to him of the grandeur and nobility of sorrow, the bravery of bearing pain, the cowardice of failing under a burden: and then, when she left him, she whispered to Katie—

"Be very kind to him to-morrow, *madre*. He will stand sorely in need of it."

But even Kate did not dream what the words meant.

The harvest-moon that night shone down upon many different scenes. It crept into a superb room in London, where Sir Owen, flushed with love and wine, told with many an oath to a choice circle of friends how he had outwitted the lawyer and carried off his bride.

"I shall have some fine amusement with him when I return to Garswood," he said. "He must have been as vain as Narcissus himself to think that any girl would prefer him to me."

His friends drank his costly wines and applauded him—each ignoble sentiment, each mean idea—until they could do so no longer.

The moon looked in at another window—the window of a magnificent chamber, wherein lay all the details of a superb bridal costume—a lace veil of priceless value, a wreath of orange-blossoms, white satin shoes and white gloves, with a dress that was a triumph of art. It shone on a pretty white bed whereon a young girl lay—on golden hair that was all disheveled and lying in silken profusion over the pillow—on a fair and beautiful face all stained with tears; for on this evening something like remorse had come to Violet Haye, and she had wept with a wild cry for the lover whom she had bartered for gold. Even the diamonds, the costly gems, the rich dresses, the wealth and grandeur for which she had sold herself, had not power to soothe her. The same moon shone into the room where Eve Lester knelt, her fair face raised to the evening skies, praying Heaven to help the man she loved through the bitter hour of his pain and desolation. It shone into the room where Felix sat writing because he could not sleep and was unable to find rest in anything except work. The silvery moon shone brightly over all.

Felix worked until his tired eyes could see no longer, and then he put away his papers. He had business for the morrow, and, if he could not sleep, he said to himself that he might close his eyes and think of that.

He went to the office early the next morning, and it struck him that there was an unusual stir in the streets. A band of music passed him. He saw the people, gaily dressed, all going in the same direction. He wondered if there was a *fete* anywhere,

or any fair that he had forgotten. It was the fourteenth of September—no, he could not remember that it differed from any other day. He saw that it was a lovely morning; there was bright sunshine, a sweet western wind, while all nature looked blithe and gay; still he could not understand the commotion in the town.

He went into his office—even the clerk was not there. Without loss of time he went to work busily at his papers. Ha! Surely he was not mistaken as to the chime of the old church bells—surely they were chiming not an every-day chime—surely he heard a burst of jubilant melody, a clang of joyful sound? He opened the window and the rich waves of sound came in upon the sunlit air.

"It is like the sound of wedding-bells," he thought to himself, "but no one has been married from here."

There was something pathetic in the handsome wondering face leaning from the window, listening to the bells that were ringing his death-knell.

He could not write; it was as though a thousand gay and airy shapes were flitting round him. There was one consolation—the bell-ringing could not last—it must stop soon. He could not work with that mad, merry music filling the air; but he could go and ask what it all meant.

It was strange that the first person he saw was the Vicar's wife, Mrs. Hunter. He asked her why the bells were ringing; and, as she looked at him, her eyes filled with tears.

"They ring for so many things," she replied; "how can I tell which it is?"

He passed on, but, as he walked away, she looked at him closely, while something like a sob rose to her lips.

"Beautiful women are beautiful fiends sometimes," said the Vicar's wife to herself. "I would not have done such a thing."

Felix thought her strange—but he had almost ceased to wonder at anything. Then he met his old friend Doctor Ludlow. He stopped and spoke to him.

"I ought to be very busy with my work," he said, "but those bells distract me. I have had to put away my writing. What are they ringing for, Doctor?"

And the kind-hearted Doctor looked sadly at him.

"Have you not heard?" he asked.

"No—I hear so little—I am so busy always. What is it for?"

But the Doctor could not tell him.

"Go as far as the church," he said; "the walk will do you good this beautiful morning. Ask the ringers—they are sure to know."

He had not the time to spare; but the morning was fine, and some strange instinct that he could not account for hurried him on.

"Why are you ringing this merry chime to-day?" he asked of one of the ringers, a white-headed old man, whose arms were wearied, and who sat resting on one of the green graves.

"Why? Because the great Sir Owen is married to-day, Master Lonsdale."

"Married!" cried Felix. "Married to whom?"

The chiming ceased and the wind fell as the old man answered—

"Married to Violet Haye."

CHAPTER XXVI.

There are no finer woods in England than the woods that surround Bramber Towers. Bramber is a glorious estate, and the woods extend to Lilford.

The Earl of Arlington, master of the Towers, had but one fault in the eyes of the county—he was too fond of travelling. It was no unusual thing for the Towers to be closed for two or three years, while the Earl, with his wife and daughter, delighted in fair Continental cities. "Let justice be done, though the heavens fall," was a favorite quotation of his.

Lord Arlington was a straightforward, honest, honorable Englishman—all devious ways and tortuous paths were unknown to him. It was always observed that if he were absent for any length of time things went wrong. His first concern on his return was to endeavor to set them right. He had been absent nearly three years this time, lingering with his beautiful wife and daughter in the quaint cities of old Spain. He reached home on the eleventh of September; and he feared that, as usual, during his absence much had gone wrong. His return was hardly known in the neighborhood—for one of the things that Lord Arlington disliked was fuss; why should there be a scene every time he returned? So he generally kept his intention secret.

The Countess was a beautiful, quiet, refined woman. One of her great characteristics was her sympathetic manner. It was natural to her to feel intensely the sorrows and joys of others. There were two children—the young heir, Lord Bramber, who was still at Oxford, and Lady Maude Bramber, a lovely girl about two years older than her brother.

Lady Maude inherited her mother's peculiarly sympathetic nature. She was as gifted as she was beautiful: and the one thing in which she excelled was art. She would have made one of the finest painters of the day had she not been an earl's daughter; as it was, her pictures were far superior to those of many well-known artists. It was at her solicitation that Lord Arlington returned home that autumn. She had seen the finest parts of Europe—the most picturesque—the most beautiful; but there was nothing she liked better than the fine old woods round Bramber; and she loved them best in autumn, when the leaves were falling, and the glorious tints of the foliage made a picture the tints of which could not be transferred to canvas.

She had begged that they might spend the autumn at home; for the beauty of an English autumn surpassed anything which they could see abroad. Her wish was complied with, as is the wish of a spoiled child often, and she promised herself a few pleasant months.

She set out one morning with her sketch-book nd pencils. The Countess suggested that she should take a maid or a footman with her—Lady Maude laughed.

"No danger lurks in our English woods, mamma," she said. "If I were in Italy or Greece, I might meet a few brigands; here at Bramber there will be nothing worse than the pretty brown hares and the little squirrels. I could not sketch at my ease with a great idle man waiting for me."

So she went into the Bramber Woods. As she neared the woods she heard a faint chiming of distant bells.

"They are the bells of Lilford old church," she said to herself; "what a mellow rich sound! I shall not hear it presently."

It died away as she entered the beautiful green glades; the sound could not penetrate the thick masses of foliage.

There was a broad open space, and a majestic oak spread out its great branches there. It was like a little kingdom in itself, this wonderful oak—a great green kingdom with a life all its own. Near it stood a very fine elm; and in the distance she saw the branches of a fine ash-tree. Not far from there was a pretty little brook, so clear that one could see the pebbles at the bottom of it; it ran with a sweet musical ripple that was a song in itself. The birds were having an entertainment of some kind in the green kingdom of leaves, and the noise they made over it was continuous.

As she became absorbed in the keen delight of her sketching, she forgot her feathered neighbors. They no longer disturbed her. It was all so still, so peaceful, so beautiful that she thought she could sit there for ever. Once she was disturbed; she fancied that from the long western glade on the other side of her there came the sound of reckless running footsteps, and then of a heavy fall, but after a moment or two she concluded that it was only the rabbits.

"They are having a steeplechase," she said, and laughed at the idea; then the pencil trembled in her fingers, for surely she heard the sound of terrible sobbing, great, passionate, bitter sobs. She could not be mistaken—they grew more bitter and deep, and then all was still. She tried to go on with her drawing, but her hand trembled—she could not persuade herself that what she had heard was fancy. Something must have made the noise—she would go and see.

(To be continued.)

CLEOPATRA.

ANNE CLAYBOURNE.

CLEOPATRA, Queen of Egypt, was one of the most brilliant and beautiful women the world has ever known, but her husband, Ptolemy Dionysius, who was her own brother, deprived her of her share of the kingdom and drove her to seek protection of the Romans. Cæsar was then emperor of Rome, and she used all her powers of fascination to win his favor, and succeeded.

When Cæsar was assassinated, she was accused of having assented in the crime, and was brought before Marc Antony for trial. Although coming to judgment, she came in the pride of beauty and anticipated triumph. Her galley was burnished with gold, its silken sails were filled with odors, and the silver oars, which were plied by the most beautiful maidens of Egypt, moved to the sweet sounds of music. The lovely Cleopatra, arrayed in slight drapery, reclined under a canopy on the deck, and appeared more like the dream of some sculptor or painter than like a human being.

Marc Antony was charmed with her person and talents and became her lover, neglecting his wife. But this woman of splendid attractions, who could make great men her slaves, and might have wielded an unlimited power for good, was ambitious, extravagant and unprincipled. After Cæsar's death, Antony aspired to the head of the government, but Octavius Augustus, grand-nephew of Cæsar, opposed him; a battle was fought for the sovereignty of the world at Actium on the Mediterranean, west of Greece, at which Cleopatra had sixty of her finest vessels. Just as Antony was about to gain the victory, Cleopatra, with her sixty galleys, deserted him, and he, rashly abandoning the conquest, followed her off from the field of action.

She caused herself to be reported dead, upon hearing which Antony besought his faithful friend and servant, Eros, to kill him. Eros pretended to consent, but when Antony's face was turned away, he killed himself instead. Antony was so touched by this proof of devotion, that he took the sword and wounded himself mortally, but lived long enough to be carried into the presence of Cleopatra. Here we find him in a magnificent apartment, its walls of purest alabaster, polished like mirrors, and its columns of gold, most delicately ornamented. Through the open windows are seen the dark, glossy leaves of the fig, the broad canopy of palms a hundred feet high, pavements of milk-white marble, cool as snow, and beautiful fountains of sparkling water.

On a couch which glows with the pictured fabrics of Eastern looms lies Marc Antony in almost superhuman majesty, his eyes closed, the curls parted from his noble brow, but his face so natural that, but for the rigidity of limbs, one might think he slept. Evidences of affection are all around; perfumes liberally sprinkled upon his auburn locks, and garlands of freshest flowers upon his cold limbs. Cleopatra sits beside him in speechless woe, with fixed yet vacant gaze. Unlike her regard for other heroes, she has loved him for himself, and not for his fame or power. Near them, on a table of the richest porphyry, negligently strewn with instruments of music, there stands a plain and common-looking basket, filled with the glossy leaves and purple fruit of the fig; they look very tempting, but there is a slight rustling sound, at times, and a movement of the leaves, not regular, as if shaken by the breeze, but heaving up, at intervals, as if some living thing was lurking underneath, and on a close examination, deadly asps are found crawling among the fruit; these serpents Cleopatra has applied to her bosom, and a very tiny spot of blood shows where the poison has been injected into her veins. Octavius, the successor of Cæsar, has conquered, and she will not be his prisoner; her hero is dead, and she will follow him.

Octavius comes himself, with all the nobles of his court, and flatters her with honeyed words, but she rejects his clemency with haughty scorn. He says: "We would have the beautiful Cleopatra among our friends: she is queen of Egypt still."

"By the great gods, I am! Nor is it in the power of all Rome to make me other! Free was I born and royal: free will I die and royal! Cæsar, I scorn your mercies, as I defy your menaces! My father left me a crown, and crowned will I go to my father!"

With this she flung her hand in defiance toward the victor, placed the antique crown of the Ptolemies upon her raven locks, and stretching herself upon the couch by the side of Antony, closed her eyes, gave one long, convulsive shudder, and Cleopatra the beautiful was no more. Egypt never since has known a native sovereign.

RECENT LITERATURE.

Hygiene of the Brain and Nerves and the Cure of Nervousness, with Twenty-eight original Letters from leading Thinkers and Writers, concerning their Physical and Intellectual Habits. By M. L. HOLBROOK, M. D. New York: Holbrook & Co.

THIS is a most admirable work, and one which deserves a place in every family library. As the author very truly says, "Nervous exhaustion is in the ascendant. It crops out in every direction. Our hot-house education promotes it, by cultivating the mind at the expense of the body. Our sedentary ways of living promote it. Our haste to get rich, our risks in business, our anxieties, our cares, all help to bring on nervous exhaustion. It is time for us to consider this matter in the light of science and common-sense, and see if something cannot be done to relieve our generation from the curse of nervous exhaustion, and show people how to conduct their lives so that peace and serenity shall take the place of haste and excitement, and all their attending evils." In the following chapters much excellent advice is given about diet, rest from head-work, walking, amusements, &c. The chapters entitled Important Questions Answered, What Our Thinkers and Scientists Say, are replete with valuable information. The latter part of the book is devoted to letters from T. W. Higginson, Wm. Lloyd Garrison, A. Bronson Alcott, Wm. E. Dodge, Dio Lewis, Frederick Beecher Perkins, Judge Samuel A. Foot, Sarah J. Hale, O. B. Frothingham, and many others who have become famous in the world of letters. We recommend the book to all who have charge of children, whether parents or teachers.

Common Sense in Business; or Practical Answers to Practical Questions on the True Principles and Laws of Success in Farming, Manufactures, Speculation and Buying and Selling Merchandise, with some Suggestions on making Wills and the Causes of Failures in Business. By EDWIN T. FREEDLEY. Philadelphia: Claxton, Remsen & Haffelfinger.

IT is impossible to do justice to this work in anything short of an elaborate review, or to present its many claims to the careful perusal of every one, in whatever walk of life. It is very generally supposed that business is inseparable from the principles of common sense, but Mr. Freedley conclusively shows it may be, and often is, conducted on a very different basis. He lays down clear and practical rules for the guidance of the inexperienced, as the veteran mariner describes in his charts the rocks, shoals and channels, while the questions and answers demonstrate the importance of the application of sound common sense to all the problems incident to the active duties of life. To young men, especially, it will be found highly instructive, not only in the laws of business but as to the true principles of success.

Roxy. By EDWARD EGGLESTON. New York: Chas. Scribner's Sons. Price $1.50.

As a bit of character sketching "Roxy" (the heroine) is well nigh perfect, not perfectly good but supremely natural. Most good women (in books) move about in such a grandly superior way, that they appear super-human, and the reader however much he may admire goodness in the abstract, is apt to sigh for some evidence of original sin to make the character appear more human. Mr. Eggleston has succeeded in portraying a grandly noble woman, who is, withal, a possible woman. There are also graphic descriptions of "hoe-downs" and "barbecues," forms of amusement with which many people are not familiar, and the true inwardness of electioneering in a frontier town is very cleverly delineated. Mr. Eggleston shows human nature as it is, and some rather repulsive sins appear in the course of the narrative, but his treatment of them is very delicate, and he proves conclusively that the hideousness of vice can be shown without offending the sensibilities of the most fastidious.

Castles in the Air. By LOUISE R. UPTON. New York: G. P. Putnam's Sons. $1.25.

THIS is one of the feeblest of all the mediocre volumes the year 1878 has bequeathed to the world. There is no plot—no story to speak of; the characters, with perhaps one exception, are weak and commonplace. The few incidents are improbable and uninteresting, and in fact the whole structure shows such a want of force and originality as to augur but poor success for this author's future efforts.

PORTRAIT OF LOWELL.—The publishers of the Atlantic Monthly have prepared for their subscribers an admirable life-size portrait of Hon. James Russell Lowell. It is uniform with the Atlantic Portraits of Longfellow, Bryant and Whittier, issued in previous years. It is far the best portrait ever made of Mr. Lowell, and as Mr. George William Curtis says: "The expression is most characteristic, and those who have hitherto known the poetry and not the poet, will like the poetry all the more now that they have seen the poet in so true a likeness."

Mr. E. P. Whipple, the Essayist, says: "The face is full of expression. It seems to me that every friend of Lowell, and every lover of his genius, will prize this portrait." Mr. Charles Dudley Warner, author of "My Summer in a Garden," calls it "a noble portrait of our Minister to Spain, poet, satirist, essayist, scholar." This admirable portrait is not offered to the general public, but is furnished to subscribers of the Atlantic Monthly, for one dollar, by the publishers, Houghton, Osgood & Co., Boston.

BITS OF GOSSIP.

THE BLIND PROFESSOR.—It is said of Prof. Fawcett, the blind member of Parliament, that no sooner had he recognized that he was hopelessly blind for life—he was shot in the eyes by a companion while out partridge shooting—than he determined that "it should make no difference," except perhaps that his career should be political rather than legal. Already entered at Lincoln's Inn, he relinquished, after some thought, a legal career entirely, and to the amazement of his friends proceeded to active political work. How completely his own opinion has been justified at the expense of that of his friends is now well known; but success could hardly have been predicted for the blind young man who, without money, connections, or political backing of any kind, came up to town on the death of Sir Charles Napier, and attended only by his secretary, took a committee-room and proposed to the electors of Southwark that he should represent them in Parliament. His courage, however, made him many friends, and he only retired from the contest when Mr. Layard was brought forward. Unsuccessful in his first attempt to gain a seat in Parliament, he made a second at Cambridge, which, as well as a subsequent venture at Brighton, resulted in defeat. At the general election of 1865 he contested Brighton again, and was then elected by a large majority. Again beaten at Brighton in 1874, he was shortly afterward returned for Hackney. Meanwhile he became Professor of Political Economy at the University of Cambridge, a post which he still holds.

ANNA DICKINSON TO LECTURE AGAIN.—Anna Dickinson, since her theatrical experience of last season, has been devoting herself to the study of French History, in which she had already become interested to an unusual degree, and at the solicitation of friends, she has consented to appear again on the lecture platform, and give, in a series of lectures, the result of her studies. Miss Dickinson has consented to this arrangement with reluctance, fearing that it might be said that she had given up her intention to follow the stage. Her lectures will be delivered in only the largest cities, beginning in New York, and her subjects for the series, which will include four lectures, will be "Joan of Arc," "Henry IV," "Voltaire," and "Danton." She will be under the management of the American Literary bureau. Miss Dickinson's return to the lecture field should not be construed into an abandonment of her theatrical aspirations. She attributes her ill-fortune theatrically to the treatment she received at the hands of the New York critics, and she has determined to wait for an auspicious time, and then to tread the boards again in characters of her own creation.—*N. Y. Sun.*

A GOOD SHOWING FOR AMERICA.—The thrift and industry of the people of New York city are clearly illustrated by the comparison of our savings banks deposits with those of three of the most economical and industrious nations of Europe, as follows, the figures being taken from the latest official returns at hand:

	Population.	Deposits.
New York City	1,100,000	$174,177,622
Switzerland	2,669,000	57,600,000
Austria	35,904,435	179,475,824
France	36,102,921	132,085,000

This comparison shows the thrift of the people of New York city in a light never before presented. The savings banks deposits of New York city, with a population of 1,100,000, are more than three times greater than those of Switzerland, with a population of 2,669,000; are within $5,298,201 of those of Austria, with a population of 35,904,435, and are $42,092,623 in excess of those of France, with a population 36,102,921.—*N. Y. Express.*

NO HARD TIMES IN "TEMPERANCE" VILLAGES.—Mr. Wm. E. Dodge, the well-known manufacturer and merchant of this city, when recently before the congressional labor committee as a witness, said that his firm employing some 2,000 persons, made it a rule that persons engaged in their manufacturing villages should not use intoxicating drinks. As a consequence there was no complaint of hard times among them. The villages named by him were Ansonia, Conn., Dodge Mills near Williamsport, Penn., Tabyhanna Mills, Warren County, Penn., St. Simon's Mills, Ga., Wabasheen Mills and Magnattiwan Mills, Ontario, Canada, and Collingwood Mills, Canada. Many of our employes, Mr. Dodge continued, are property owners. Some of them have been with us ten, twenty and twenty-five years. Our men have not suffered during this depression. They accepted wages which we could pay, and there has therefore been no special distress among them. Crime is practically unknown among them.—*Scientific American.*

HONEY sent to England in the comb over a month ago, for the first time, reached Liverpool safely on the 5th of December, and the experiment is pronounced successful. There were eighty tons in one ship, stored, says the Pall Mall Gazette, with some curiosity, "by American bees themselves into half a million neat little glass-sided boxes." That paper learns that the honey was the partial product of 12,000 swarms of bees, in which a large mercantile firm is interested, and which are distributed throughout the honey-producing sections of the United States in apiaries of 100 swarms each. "There seems to be no limit," it says, "to the provisions with which America is prepared to supply us. The first experiment of bringing honey in the comb on a large scale to Europe from America having proved successful, it will no doubt be repeated. Honey will even perhaps become with us, as it was with the ancients, an important article of food."

News of the Week

[NOTE.—The RURAL NEW-YORKER expresses no political opinions whatsoever. We merely furnish a *resume* of the week's political occurrences for the benefit of those who do not read the daily papers.—EDS.]

Monday, Jan. 13, 1879.

POLITICAL.

Congress returned from its holiday relaxation on Tuesday. There seems to be less disposition than usual in that body to talk for the sake of making political capital, and therefore more attention is being paid to business. It seems doubtful whether the bill for reorganizing the army will be passed. Much opposition has been expressed by prominent men against some of its provisions, chiefly on the ground that too much power is put into the hands of General Sherman. All hope of the passage of Mr. Edmund's electoral bill, or any other measure on that subject, might as well be given up. The House Committee on this question has decided to report the Senate bill adversely, which kills it, and directed the Chairman to call up for early action the House bill known as the Southard bill. Mr. Southard hopes that his bill, which is now on the Speaker's table, will be reached as early as next week, but it is not certain that it will ever pass the lower branch, while if it should, it would probably fall in the Senate.

The Credit Mobilier suit, under a special act of Congress, authorizing the government to sue the celebrated ring to recover damages, has at length come to the end foredoomed, when Judge Shipman at the first trial at Hartford sustained the demurrer of the defence to the suit. The Supreme Court of the United States has sustained the demurrer, and the case falls to the ground. To turn a bad trade into a good by means of a long subsequent lawsuit is a task as hopeless for Congress as for anybody.

MISCELLANEOUS.

THE American railroad construction for 1878 amounts to 2,688 miles, the largest for any year since 1873. It has been mostly in the Middle and Northwestern States. The notable feature of New-Year's at Ottawa, Canada, was the absence of fuss and feathers at the Governor-General's reception. Gentlemen wore ordinary morning costume, and the Marquis of Lorne went about the room talking and chatting with a degree of familiarity which surprised every one. Capt. Tom Lewis, the last survivor of the Lewis and Clark exploring expedition, which did so much towards opening up the West, was frozen to death in Albermarle County, Va., this week. The amount of seeds distributed generally throughout the Union last year by the National Agricultural Department was nearly 2,000,000 papers of vegetable seeds, 300,000 papers of flower seeds, 3,000 papers of tree seeds, and about 5,000 bushels of grains in quart packages. For the purchase and distribution of these seeds $65,000 were expended. About 300,000 copies of the Report of the Department for 1877 are said to have been published a couple of months ago, and of these 25,000 are reported to be still on hand. They contain a good deal of agricultural information, and farmers should send for copies.

New York State has 1,100 establishments for factory dairying, with 28,000 dairymen as patrons, representing 308,350 cows, producing 3,210,000 pounds of butter, and 99,032,750 pounds of cheese. Of these 23,000 dairymen, not over six have any time to waste on politics. A butter and cheese firm of this city, after several days' labor, has ascertained the amount of cheese now in store in New York to be 396,467 boxes. Some of the western roads are contemplating carrying storm signals on trains for the benefit of farmers. This will knock the family almanac higher than a kite. The message of the Governor of Tennessee favors a prompt settlement of the State debt at fifty cents on the dollar, as suggested by the State's creditors.

The Mormons have long insisted that as the lawfulness of polygamy was a part of their religious belief, Congressional laws against a plurality of wives in their case were unconstitutional, inasmuch as the Constitution forbids interference with religious beliefs. The constitutionality of the laws of Congress against polygamy in the Territories has, however, been at last definitely affirmed by the Supreme Court of the United States, and the pet institution of the Mormon religion will feel the restraints of law draw closer and closer around it. The fact that marriage goes outside the sanction of law, when more than two persons unite in it, and becomes a mere lawless concubinage, conveying no rights and depriving offsprings of legitimacy, will, in the long run, prove too heavy a load for the Mormon church to bear. Woman will revolt from it. Now let the United States courts apply the steady educational pressure of legal restraint.

A considerable increase in immigration to America is shown by the figures giving arrivals at New York during 1878. The total for the year, 121,695, is yet far short of those of a few years ago, but 25,000 greater than that of 1877. The dawn of better times here and growing depression across the Atlantic, together with the political persecutions in Germany, will doubtless largely increase the immigration this year.

The cold spell seems to have relaxed in most parts of the country, and now floods and their disastrous results are succeeding the miseries of a heavy snow-fall. The Ohio is already unusually high and rising and unless a sharp frost locks up the melting snow, much loss must occur. Reports from the Southern States show that the cold there was unusually severe. We are told the mercury stood at 20° above zero in New Orleans Sunday night, which is the lowest since 1857; at Vicksburg, Miss., it was at 12° above; at Jacksonville, Fla., there was sleet and ice, and skating for the first time in twenty years at Atlanta, Ga.

Reports from the fruit sections of Florida show, however, that the orange crop and trees were not changed by the recent cold snap.

The public debt statement is as follows:

Six per cent. bonds	$657,846,200	
Five per cent. bonds	703,266,650	
Four and half per cent. bonds	250,000,000	
Four per cent. bonds	198,700,000	
Total coin bonds		$1,809,812,850

This sum bears interest, but the following items do not:

Lawful money debt	$ 14,000,000	
Matured debt	22,446,460	
Legal-tenders	346,743,051	
ertificates of deposit	34,515,000	
Fractional currency	16,108,154	
Coin and silver certificates	24,076,830	
Total without interest		$ 421,443,035
Total debt		$2,267,702,345
Total interest		24,841,793
Cash in treasury:		
Coin	$224,865,477	
Currency	4,515,550	
Currency held for redemption of fractional currency	10,000,000	
Special deposits held for redemption of certificates of deposit	34,515,000	
Total in Treasury		$ 273,896,027
Debt less cash in the Treasury		$2,028,648,111
Increase during December		1,223,785
Decrease since June 30, 1878		7,138,720

Prices of produce and provisions at Chicago on the 1st of October of each year from 1860 to 1878, inclusive:

	Mess Pork. Price per bbl.	Lard. Price per lb., cts.	Wheat. Price per bush.	Corn. Price. per bus.
1860	$18 50	12½	$1 00	43
1861	18 50	7¼	85	21
1862	9 00	7½	96	33⅓
1863	13 50	10	1 05	75
1864	42 00	18	1 41	$1 24
1865	38 00	20	1 32	57
1866	32 00	17½	1 90	64
1867	23 50	13¾	1 86	1 02
1868	28 75	18¾	....	....
1869	32 50	18	....	....
1870	25 00	15¼	1 06	64
1871	13 00	9¾	1 23	47
1872	14 25	8½	1 18	35
1873	14 25	7¾	1 00	36
1874	20 87	14½	94	82
1875	22 50	13¾	1 11	55
1876	16 50	10¼	1 06	44
1877	14 25	8¾	1 10	43
1878	7 87	6⅝	87	34

The prices of these products, throughout the country, have borne the same proportion with those at Chicago in all these years, as at present.

The following average of retail prices in several towns East here, will show the difference in the figures at which the chief necessities of life can be bought at the dates mentioned:

	1860.	1865.	1878.
Flour	$8 00	$20 00	$8 00
Butter	23	60	23
Pork	12	30	12
Tea	50	1 50	50
Sugar	11	16	10
Fish	4	12	6
Beans	6	12	8
Cotton cloth	14	33	8
	$9 20	$23 13	$9 17

FOREIGN.

Across the Atlantic distress and starvation are on the increase in England. Owing to the large number of people idle, the threatened strikes on reduction of wages, have generally been postponed. In Germany the political troubles still continue; there is an alarming stagnation in business; and Bismarck is still urging a strong protective tariff as a remedy for this evil. He has also lately framed a law to do away with the freedom of speech in the Reichstag, or legislature of the Empire, the only spot in its broad extent where liberty of speech is now tolerated. He wishes the enactment of severe penalties against all those who may say anything there displeasing to the Government. France is more prosperous apparently than any country in Europe. The winter in the British Isles and all over the Continent continues unusually severe. Snow storms are frequent and heavy and the coast has lately been visited by several disastrous hurricanes. This morning's cablegrams intimate that that Manitoba cold wave of ours has just finished its journey across the Atlantic and is now giving a strong taste of artic weather to our cousins beyond the water

Shere Ali is on his way to St. Petersburg where he will beg the Czar to intervene in his behalf with Great Britain. His request, however, will not be granted in that quarter, but it is said that he may be more successful with the Emperor of Austria, as the latter country is looked upon as the friend of England, and can therefore intercede for the Ameer with a better face and chance of success. The English in Afghanistan have captured Candahar, and have informed Yakoob Khan of the terms on which peace may be concluded.

The oft-repeated story that the French Provisional Government of 1870 under Gambetta stole or lost a sum of $49,200,000 has been finally set at rest by an official investigation and statement. One of the worst taunts of the Imperialists and Monarchists against the one-eyed Jewish statesman is thus silenced for ever—if calumny can ever be silenced. Germany had two hundred and sixty sugar factories in full work during September. The yield of beets in both Germany and France last year was inferior to that of 1877. The selling of beets according to the relative density of the juice is making its way in France, and promises to become popular, as it will protect both the farmer and the manufacturer. Don Baldomero Espartero, duke of Vittoria, who for two or three generations took a prominent part in Spanish affairs both as a soldier and statesman, died at Madrid on Wednesday. He was born Feb 27, 1792, at Granatula, near Ciudad Real, in La Mancha.

It is uncertain when the widow of Minister Bayard Taylor will return to America, her landlord refusing to allow her to surrender her house until the expiration of the lease. For a long time the raising of tobacco has been prohibited in Great Britain in order to enable the Government to realize the greatest amount of revenue from taxes on its importation. It is now proposed to allow it to be cultivated in order to give employment to the people who are out of work, and also because farmers there, too, are on the outlook for something to cultivate, which will yield a little more profit than many of their present products. During the recent war 594,000 Russian soldiers poured down through Roumania into Turkey. Of these, 58,800 were sent back by rail wounded and 62,150 ill, 31,000 sick went back home to Odessa by sea, 29,000 are still in hospital, 31,000 laid their bones in Roumania, and 99,000 perished in Bulgaria.

Many American writers seem to believe that the vast indemnity exacted by Germany from France at the close of the war of 1870, is no longer a burthen upon the latter country—that the debt has been entirely wiped out. In this, however, they are egregriously mistaken. France, it is true, promptly paid the amount to Germany, but to do so she had to borrow it from others—chiefly from her own citizens, though a great deal of the money was loaned by English capitalists, some by Germans and not a little by other Europeans who wanted a good investment. During the six months of active hostilities between France and Germany the indebtedness incurred on account of the war amounted to five hundred and seventy-three million dollars, when the payment to Germany of an indemnity of one billion dollars was agreed upon. To meet this, the French Government, during 1871 and 1872, borrowed one billion six hundred and forty million dollars, agreeing to pay five per cent. interest. This amount, by reason of discounts and other expenses, was reduced to one billion one hundred and forty-five million dollars. This was the way in which the German indemnity was raised. Not one dollar of this money has been paid to the creditors, and interest is still being paid on the entire amount. France, in addition, has a large funded debt, always increasing by reason of deficiencies in the revenue. Her public debt has increased nine hundred and forty-six million dollars in the last three years. Her interest account is largely in excess of ours, and, did they borrow at the same rate as we, it would be further increased. The French Government can borrow at three per cent, while ours pays four. The impression that France has paid off her debt, by issuing paper, is utterly groundless. She still owes the money raised for the German indemnity, and much more beside.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

NOTES.

— Pie is an enemy in ambush.

— *Interest* is the spice of housekeeping.

— Oil of cinnamon will cure warts.

— Do not put mussy butter dishes upon your table.

— Newspapers are excellent for polishing glassware and windows.

— A salve made of equal parts of lard and gunpowder is recommended for frost bites.

— Old boot-tops cut into suitable size and lined, make very good ironing holders.

— Dip candle molds into hot water for an instant before drawing.

— Marion Harland says: "Between butchers and cooks, there is enough wasted in American kitchens to supply a national soup-house that might feed all the poor in the land."

— Mrs. Henry Ward Beecher says: "If parents would learn in time that over-indulgence in childhood brings to their children in later life only an inheritance of regret and disappointment, how many lives would be made happy and cheerful that now, through over-indulgence, are utterly wrecked and useless."

MOP-HANDLE PAPERS.—No. 11.

MAY MAPLE.

Grandma's Lamentation.

"STRANGE as it may seem, it is no less true, that there is always a black sheep in every well-to-do flock," said Grandma Dalton, as she took up her knitting work and seated herself in the warm, cozy corner of the sitting-room, always reserved for her when she made us her annual visit. "Now anybody that ever seen me at home knows," she continued, "that I never could endure slipshod, slovenly habits; and I never could allow my girls to do their work in a careless, shiftless manner, while they lived at home. Now Patty and Lucy and Maria are as neat about their persons and tidy about their homes as any mother could desire, and I am proud to think they are my daughters. But there's Hellen, that we always dubbed "Beauty," on account of her fair face and symmetrical form, has been a disgrace to her bringing up ever since she was married.

"Why, the other day when I was there, I counted *five* empt'ins dishes settin' round the yard, half or two-thirds full of dish-water, 'left to soak;' and then there were three or four dough pans standing about with flour and dried dough enough in each one to make a good-sized biscuit. Now, Hellen was never allowed to leave her bakin' dishes in that shape when she was at home; but she always hated to wash dishes and do housework the worst of anything in the world, and now that she can do with her own as she likes, she forgets her home training. I have about made up my mind that old King Solomon did not know much about human nature, leastways of girl nature, when he said, 'Train up a child in the way he should go, and when he is old he will not depart from it.'

"It is no more work to clean an empt'ings' jar, than it is a breakfast plate, if it is put into a pan of water, bottom side up, as soon as the batter is all rinsed out that is needed for the bread; and then when the dough is molded into loaves, the jar can be washed with but very little trouble. There is no sense in leaving a thick scale of dough about the bread or cake pan. Almost every particle of flour can be kneaded or stirred in with the mass. I don't wonder so many people suffer for the common necessities of life, so much is left to go to waste through pure carelessness; and unless Hellen turns over a new leaf, she will yet eat the bread of poverty. She has already lost many friends by her slovenly habits. I can't see why, when one has come to years of maturity and knows how to do work well, she will not do it right even though it may be distasteful. She might do right for the sake of pleasing those she loves, if for no better motive."

"But a sloven is invariably selfish." And Grandma Dalton sighed over the weakness of her once beautiful daughter, Hellen. And well I knew she had reason to be sad, as have many mothers who see their life work marred by unsightly blemishes.

NEURALGIC TOOTHACHE

SOON after my restoration to health from a severe illness last fall, I was troubled with a pain in the face, that seemed to proceed from the teeth, but which affected the whole instead of one particular tooth. At intervals all ache disappeared, and I hoped forever; then, again, it returned with stinging sharpness, up to the temple and along the upper and lower jaw. Several friends, martyrs to neuralgia, told me I was finding out how bad it was, for the first time, and for the benefit of many who may suffer in like manner, I write down my cure. One evening while the pain was very severe, I happened to read in a newspaper that an eminent physician had successfully tried powdered quinine. He dipped his finger in clean water, then into the quinine, and what adhered he rubbed along the gums, keeping it in the mouth as long as the bitter taste could be endured. Repeat, if necessary. I tried it faithfully—it was oh! *so bitter*, but the pain went away, and I hope others who may be similarly afflicted will find relief in the same way. ANNIE L. JACK.

MENDING RAG CARPETS.

WHEN my mother was sitting at her work the other day, I wondered if any other house-mother had mended her rag carpet as she was doing. When there comes a break in it, if the warp is broken, she ties the same kind of warp to one end of one thread at a time, and then across the break to the other end of the broken warp. Always be sure to tie what the men call a flat knot, so it will not slip. Bridge across thus each separate thread of warp. Then with the tape needle weave in carpet rags, going over one thread and under the next, across then back and so on until the break is all filled in. By so mending your neighbors will never know your carpet is patched. If your are careful you can weave in the ends of the warp with the rags so there will be no ends to give it a ragged look. Yes, I will say rag carpets do pay and if the rags are cut even and fine, and nicely colored, and woven in fine strips, they are pretty too. A WISCONSIN WOMAN.

SKINS FROM PEACHES.

IF Mrs. J. W. L. will place her peaches in a large wire basket and plunge them first into a kettle of *boiling* lye, strong enough to bear up an egg, and then into a tub of cold water, she will find little trouble in removing the skins. Experience will enable her to determine how long they should remain in the lye to eat off the outside skin. Plenty of water should be used in rinsing. Rub off the skins in the first water and throw the peaches into a pail of clean water. MARY B.

CARPET SWEEPERS.

WE have used a carpet sweeper in our family for four years, and now would not be willing to keep house without one. There is no doubt in my mind, M. W. F., as to "their superiority over the ordinary broom" for *every-day sweeping*. It is true that they will not sweep in the corners, but even when using the common broom, a whisk is preferable for that purpose. In their use little or no dust rises to settle upon the walls, furniture, etc., and the expenditure of strength in their working is as nothing compared to that in broom sweeping. A friend who is too feeble to sweep her room the usual way, tells me that since the purchase of a sweeper a year ago, she has been able to care for her own room with but little fatigue. A sweeper will pick up hairs, threads, pins and needles, which a broom will pass over, and in the sweeping of heavy carpets, it supplied a want in our family long felt. I have not been able to detect that it wears out the carpets, neither am I prepared to state, as many do, that its use is attended with far less wear and tear than when the sweeping is done with a broom. I am asked if sweepers can be used to the entire exclusion of brooms, and I reply, no: that the Friday's sweeping of those rooms in constant use, will be more satisfactory if the broom is first used and then the sweeper rolled over to gather up the settled dust, broom-splints, thread, etc., which the broom may have left. E. M.

DOMESTIC RECIPES.

Orange Snow.

THE juice of four large oranges and one lemon; the grated rind of an orange and half a lemon. Soak a package of gelatine in a coffee cup of cold water; when dissolved add the juice and grated rind and a coffee cup of white sugar. Cover and let stand an hour; then pour on two and a half coffee cups of boiling water; strain through flannel; when cold whip in the beaten whites of three eggs; turn into a mold and set on ice.

Orange Jelly.

add a pint of boiling water; a pint of orange juice and a pound of white sugar; let come to a boil; strain through a jelly bag and pour into molds.

MRS. L. D. H.

Cayuga, N. Y.

Fried Tripe.

Dissolve a box of gelatine in a pint of cold water; Dip into beaten egg and then in cracker crumbs; fry until of a dark brown on both sides; take up

onto a platter; add a little vinegar to the gravy and pour over.

Kidney Stew for Breakfast.

Boil kidney with one onion chopped fine, until very tender; then take the kidney up and chop into bits; return to the fire; boil up and thicken with a spoonful of corn-starch; season with pepper, salt and a lump of butter and pour over little squares of toasted bread. It is best to boil the kidney the day before it is wanted for breakfast.

E. M.

OUR FREE SEED DISTRIBUTION.

SEEDS of the following varieties of plants are offered to our subscribers without any charge whatever (except for postage, a part of which we bear) until further notice:

DEFIANCE WHEAT. A hybrid spring wheat. The most promising variety ever before offered.

"PEARL" OR "EGYPTIAN" MILLET. One of the most promising fodder plants known.

BEAUTY OF HEBRON POTATO. According to many careful tests, this is ten days earlier than Early Rose, as good in quality, and more prolific.

THE VOORHIS WATERMELON. A specialty of the Rural Farm.

GOLDEN RURAL TOMATO. A specialty of the Rural Grounds.

ACME TOMATO. This is offered as the best of the newer varieties of Tomatoes to those who may prefer it to a trial of the Golden Rural.

NEW BRONZE RICINUS. Specialty of the Rural Grounds. The most beautiful Ricinus in cultivation. A cross between Ricinus Gibsonii and R. sanguineus.

HIBISCUS MOSCHEUTOS—the showy and beautiful Rose Mallow, never before offered so far as we know. Hardy.

CALLICARPA AMERICANA (Purpurea). The brilliant French Mulberry. Hardy.

HIBISCUS SYRIACUS. One of the most charming of hardy shrubs. Sometimes called "Rose of Sharon." Our seeds are saved from double-flowering varieties—many of them from seedling plants. They grow readily from seeds, and bloom as soon as plants would if transplanted from nurseries. The seedlings "sport" without end.

WEIGELA. Seeds saved mostly from seedlings. This is probably the finest hardy shrub in cultivation.

DEUTZIA CRENATA fl. pl. Seeds saved from seedlings at the Rural Grounds. Seventy-five per cent. of seedlings will bear double flowers. It is perfectly hardy and there is no finer shrub known for ornamental grounds.

HIBISCUS MILITARIS. Hardy and beautiful.

ERYNGIUM LEAVENWORTHII. The most striking annual of recent introduction. (See RURAL of November 9th for engraving of this and other plants, seeds of which we offer.)

GERANIUM SANGUINEUM. A true geranium of great beauty. Perfectly hardy.

YUCCA FILAMENTOSA. Every farmer and lover of plants should have specimens of this perfectly hardy evergreen liliaceous plant in his grounds. It is superb.

VITIS HETEROPHYLLA. See RURAL, Nov. 9, for description of this hardy vine.

RURAL HYBRID AQUILEGIAS. Beautiful, hardy perennials of great beauty.

GRINDELIA SQUARROSA. See RURAL of Nov. 9 for remarks.

OBSERVE.

Any ten of the above require a one-cent postage stamp:—that is, ONE *cent* for the ten, not for each except the Beauty of Hebron Potato, Pearl Millet and Defiance Wheat. The Beauty of Hebron requires a two-cent extra stamp and the other two a two-cent extra stamp also.

Other varieties *may be* added. We intend this free seed distribution to be the most valuable of its kind that has ever been gratuitously offered by any journal, and to introduce the above valuable plants to the homes of farmers and horticulturists in every part of our country.

WE offered, some time ago, to sell the cuts used in this Journal for twelve cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

For Throat Diseases and Coughs.—"*Brown's Bronchial Troches*," like all other *really good* things, are frequently imitated, and purchasers should be careful to obtain the genuine article prepared by John I. Brown & Sons.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 11, 1879.

BEANS AND PEAS.—There is no revival in the bean trade, and with heavy supplies of mediums and marrows prices have declined, closing unusually weak for winter. White kidneys easier in sympathy with marrows. Red kidneys very firm for smooth, high-colored parcels. Black beans steady. Pea beans nominal. Green peas $1.30 on truck, and $1.55 in store. Canadian field peas quiet at 72@74c., in bulk and bond; Southern fl. E. peas, $2.60@2.70 per 2-bush. bag; Medium beans, prime, $1 40; good, $1 20 @1.30. Marrow, prime, delivered on vessel, $1.40@ 1.45; fair to good, $1.25@1.35; pea, $1.35@1 5; white kidney, $1.70@1 90; Red choice, $2.4 @2.50; other, $2 20@2 35; Black or turtle soup, $2.05@2.20.

Receipts of beans for week, 4,880 bushels; exports, 807 bbls.

BEESWAX.—There is nothing being done outside of small lots to shippers, quoted at 26@27c. for Western and Southern.

BUCKWHEAT FLOUR—Is plenty and easy, selling at $1 90@1.95.

BUTTER.—The market as yet has only a one-sided position, the demand being directed to finest qualities. Arrivals of both State and Western have been moderate, and a constant though not heavy drain upon the upper grades has made prices favor sellers. Single State dairies are no higher, but with the new figures for best grocery use fine full ends have been frequently broken off to meet the demand. Exporters have bid 2c less than at our last and have obtained some sound stock a shade below New York views of table quality at 23@26c. Exports for the week equal to 3,263 firkins. West Indian packers are using common State at 10@12c. State pails are no longer quotable as a quantity. Western creamery is very firm and quoted materially above State. Prices for market grades of Western, including dairy and reliable factory marks are firm. Rates for such grades are much nearer State than usual. Choice rolls are scarce; this style of butter seems to have lost its specialty among consumers to a great extent.

State, full dairies, special, 20c.; other, 16@19c.; firkin dairies, fair to prime, 15@18c.; Welsh dairies, fine full, 16@17c.; choice half tubs, 23@25c.; fair to prime do., 16@21c.; choice Welsh, 19@20c.; fair to prime, 12 @17c. Choice creamery 23@24c.; best western creamery, 33@33c.; other, 2@@3c.; early packed creamery, 17@20c.; poor State, 9@12c.; Western dairy, fine fresh, 18@20c.; fair to good, 10@15c.; factory, ladle packed, 17@18½c.; good, 14@16c.; other, 6@8c.; rolls, 8@15c.

Receipts for week, 20,150 pkgs.

CHEESE.—The imports this week have been 36,163 boxes; there has also been more interest shown by home trade buyers, and most grades are held rather steadier. The cheapest factories still hold relatively above fine grades with the stocks of special factories very moderate, and shippers wanting them. Good grades and extreme low qualities, however, have more call. Quotations are: 8½@9c. for fancy—special lots held at 9½c.; 8@8½c. for fine lots; 7½@ 7¾c. for good; 4@5c. for skimmed; State, farm dairy at 8@ 8½c. for fine; 7@7½c. for good to prime. Wisconsin factory, fine, 8½@8½c.; some fancy lots to 9c.; do. good to prime, 7½@8½c. Western factory, fine and fancy 7½@8½c.; good and prime, 6@7c.; do. full skimmed, 2@5c.

Receipts for week, 5,377 boxes.
Liverpool cable 45s.
Steam to Liverpool, 30s.

BROOM CORN.—There are free sellers on fair supplies, and a slow trade. Jobbing rates are 3½@4@4½ @5½c. for inferior to choice. Car lots do not exceed 4½c. for very best, and off grades sold as low as 3c. One car very poor sold at 2c.

COTTON—Has been very variable, as the Liverpool advices were favorable or otherwise, closing, however, strong; latest prices are for January, 9. 0@ 9.22c.; February, 9.43c.; March, 9.63c.; April, 9.77@9.78c.; May, 9.92@9.93c.; June, 10.03@10.04c.; July, 10.11@ and August, 10.21@10.23c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store ranging in quality not more than half a grade above or below the grade quoted:

DRIED FRUITS.—In apples there is a light export movement in Ohio quarters but, outside of this there is very little interest shown and prices are not settled. Peaches are slow and unchanged. Small fruits generally are having but little inquiry. Quotations are:

Southern plums at 13½@14c.; State plums, 15@15½c.; Blackberries are quoted at 3@5½c. Peaches—Peeled Georgia, at 6@7c. for poor; 8@9c. for fair to good; 10 @10½c. for prime, choice North Carolina, 11¼@12½c.; good do., 8@10c.; unpeeled halves, 3@3½c.; quarters, 3@3½c. Pitted cherries, 22c. Apples—Old State quarters, 2½@3c. New apples, 2@2½c. for southern quarters in bags.; 3½@3¾c. for good and prime sliced; do., fair at 2¾@3c. State at 3¾@3¾c. for new sliced; and 3@3½c. for quarters; western at 2¾@3¼c. for new quarters. Raspberries, 22c.

Exports, past week, 370 bbls. apples.

DOMESTIC FRUITS.—Apples are somewhat stiffer; that is, the demand is running upon selected sorts. This is usually the case after a severe frost. Greenings are selling more briskly. Choice Spitzenburgs not plenty and may suddenly advance. Lady apples have only a chance sale now there is no regular quotations. Selected Spitz. $1.75@2.12; other $1.25@ 1.50; Baldwins, $1.37@1.87; Spys, and Greenings, $1.25 @1 62; inferior, 75c.@$1. bbl. Cranberries quiet—late high rates have checked business. Fancy Cape Cod, bbl., $9; fair to prime, $7@8 50; poor, $5@6 50; N. J., crates, fancy, $3; other, $2@2.25. Catawba grapes, nominally, 6@7½c. Fla. oranges in good demand when in good order. A good many cases turn out poorly; high colored stem picked boxes, $5; for other the range is $1 15@4; bbls., 4@8. Pecans, Texas, 8@9c per lb. Hickory nuts, shellbark, lower, $2@2.50; Va. hand-picked peanuts, $1.10, other grades, 3½@5c.; shelled, 4@5c. Market quiet, as buyers stocked up freely during the holidays.

Export of apples for week, 3,345 bbls.

EGGS.—Supplies of fresh are small, but strong prices curtail trade. Early in the week 28c. was marked for Western, but 27c. is now extreme for State, Western or Southern. Limed have worked out well thus far, and prices are firm. Near points, 28 20c.; W. & S., 26@27c.; Canadian, 21@25c.; inferior, 23c. Limed, choice, 19@20c.; good to prime; 18@19c.; poor, 16@17c.

Receipts for the week, 2,8 6 bbls.; do. last week, 1,241 do.

ESSENTIAL OILS—Unchanged; rates to brokers: Peppermint in tin, $1 60; in glass, $2.30; sassafras, 44c.; wintergreen, $2.15; tansey, $2; wormwood, $3; pennyroyal, $1.25.

FEATHERS.—Live white Western geese 40@45c.; common poultry feathers not wanted.

FURS AND SKINS.—Prices remain firm but the catch this season is large, and exporters and other wholesale buyers do not commit themselves to sustain current rates. Interior purchases are known to be large.

Southern furs usually sell 15 to 20 per cent. below western.

FLOUR.—Trade has dragged a little the past week, and prices have been barely supported, although the receipts have been light. Neither the exporters or home trade buyers have shown much interest.

Latest sales are at $3@3.50 for inferior to strictly choice superfine state; $3.60@4.10 for very poor to good extra do., old lots and lines; $4 90@4.25 for good to very choice do., and fancy lots above this; $3.10@3.50 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.60@3 90 for very inferior to good shipping extra do. and $3.90@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.00@5.00; choice to fancy do. at $5 00@5.75; red and amber winter wheat, very inferior to very choice trade and family, $3.90@5 60; round hoop Ohio at $3.85@4.25, and trade and family grands at do. at $4.25@5.60, the latter rate for very choice; St. Louis, $4.00@4.75 for very poor to good extra, and $4.75@5.60 for good to choice; Minnesota clear, very inferior to fancy, at $3.50@ 5.00; few brands going above $4.50; Minnesota "straight," inferior to fancy at $4.40@5.60; and patent fair to strictly fancy at $5.25@8.25, few brands going above $7.50; unsound stock at from $2.00@4.75; city mill extra at $4 60@5.00 for West Indies (the latter rate for fancy in new packages); do. for England $3.65@3.80; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.50 for fair to very choice; No. 2 at $2.40@3.00 for inferior to fancy.

CORN MEAL.—Sales at $2.75@2.85 for Brandywine and $2.25@2 35 for yellow Western.

GRAIN.—Wheat has gained a little in price on small receipts, and somewhat improved export demands.

Latest sales are of ungraded spring at 85@86c.; rejected at 77c. No. 3 spring at 89¼@91; No. 2 Milwaukee spring, strictly prime, at $1.01; ungraded amber at $1.03@1.11½, No. 2 amber at $1.05½@1.06; No. 1 red at $1.10½; No. 2 red at $1.10¼@1.10¾; No. 3 red $1.03@ 1.05; ungraded red at $1.05@1.10½; extra white at $1.11½; white State at $1.11@1.11½; No. 1 white, at $1.10¼@1.10¾; No. 2 white at $1.07¼@1.08; ungraded white at $1.07@1.11; No. 2 amber, January option, at $1 05¾@1.06; do., February option, at 1.07; No. 2 red, January option, at $1 10¾.; do, February option, at $1.10¾@1.10¾; do., March option, at $1.11¾. Corn has fluctuated a little, closing firm at for steamer mixed, at 43@45½c.; New York No 2 at 47½c., and do. in store at 46½c. for prime; New York No. 3 at 41¾@44¾c.; ungraded mixed at 46@47¾c.; New York No. 2 new at 45¾@46c.; New York steamer white at 45c.; No. 2, January option, at 47¾c.; do, February option, at 45¾@ 46c.; new No. 2, Jan. option, 46c.; steamer mixed, January option, at 45¼c.; do., February option, at 44¾c. Oats have been light and rule firm. Sales of New York No. 1 at 31¾@31½c.; New York No. 2 at 31½c.; New York No 2 white at 34¼@34¾c.; New York No. 3 quoted at 30c.; New York No. 3 white at 33c.; New Western at 33@35½c.; mixed do. at 31@31¾c.; white State at 31@35¾c.; mixed do at 32@35¾c.; No. 2 Chicago at 31@31½c.; New York extra white quoted at 38@39c.; New York No. 1 white at 35c. offered. State 6-rowed barley, 93c.@$1; 2 do., 78 @83c.; malt, 95c.@ 1.25, the higher price for Canada.

HAY AND STRAW.—There is a fair inquiry for prime stock, which is higher, and the general market is rather favoring sellers.

Sales at 40@45c. for shipping, and 70@80c. for retail qualities. Straw quoted at 40@45c. for long rye, and 30@40c. for short rye, and oat at 40c.

Exports, for week, 699 bales.

HONEY—Continues to drag even at the unprecedentedly low quotations. Holders are becoming anxious. Clover comb, single, 10@12c.; two do., 8@ 10c.; buckwheat, 7@9c.; strained, 6@10c.

HOPS.—There has not been as much done this week, or only 250 bales exported. This has been due partly to the severe weather. Holders views are firm, and it is impossible to get choice stock, except at full late rates.

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 10@13; New Yorks, new crop, low to fair, 5@9; Eastern, 8@ 13; Western, 8@13; Yearlings, 4@6; Olds, all growths, 2@3; Pacific coast, 12@15.

LEATHER.—Quotations for hemlock sole are 18½@ 20c. for light; 20@21c. for middle; 20@22c. for heavy, and 17@19c. for good damaged.

POULTRY AND GAME.—There is no demand for live and rates do not pay for shipments.

Chickens, 6@7c., lb.; fowls, 6@7½c.; roosters, 4@ 4½c.; turkeys, toms, 6@7c.; hens, 8@9c.; ducks, choice, pair, 10@87c.; other, 45@50c.; N. J. geese, $1.50 @1.62; other, 87c.@$1.37; pigeons, 25@30c.

Dressed poultry has not arrived heavily, but most of the far State and Western is badly frozen and sells low on account of bad appearance. Fresh-killed near-points have sold at good figures. The rough stock is likely to work out at the cheap quotations, as scarcely any of it is spoiled for cooking, owing to steady cold weather. Small turkeys only have a steady call. Geese almost a drug.

Turkeys, Jersey, good to prime, 11@12½c.; Western, 8@9c.; Phila., dry-picked, 12@14c.; Chickens, do., 13@16c.; Jersey, 10@12c; State and Western, 8@9c.; other, 6@8c.; Capons, large and choice, 20@22c.; small, and slips, 17@18c.; Ducks, Phila., dry-picked, 12@13c.; Jersey, 11@12c.; State, 9@11c.; Western, 8@11c.; Geese, Phila., dry-picked, 8@9c.; Jersey, 6@8c.; Maryland, 6@7c.; State, 5c.; Western, 5@6c.

Quail continue abundant, and there is likely to be another full offering for the week. Grouse are easy, though a shade better than before. Wild ducks are out of attractive quality, and inside rates are mostly quoted. Hares and rabbits unusually plenty after the snows; prices low.

Quail, ₱ doz., 60@75c.; Grouse, trapped, ₱ pair, 60 @85c; drawn, 50@55c.; Partridges, State, 65@70c.; Western, 60@65c.; Eastern, 50@60c.; Wild Ducks, canvas-back, ₱ pair, $1.25@2; Red-head, 75c.@$1; Mallard, 50@60c.; Teal, 35@40c.; Black Ducks, 45@50c.; common, 20@25c.; Hares, 15@20c.; Rabbits, 8c.; Wild Turkeys, 16c.; Squab, $1.75@2.

OIL CAKE.—Western is lower, quoted at $27 per ton.

PROVISIONS.—Have been active and higher, on a falling off in the packing and diminished receipt; and considerable speculative activity.

Mess pork quoted at $7.40 bid and $7.55 asked for old for January; $8.75 bid and 8.90 asked for new for January; $7.45 bid and 7.55 asked for old for February; $8.75 bid and $8.95 asked for new for February; $7.50 bid and $7.65 asked for old for March; and $8.81 bid and $9 asked for new for March; and $8.85 bid and $9 asked for new for April; and May at $8.90 bid and $9.10 asked. Bacon at 4¾c. for long clear and 4¼c. for short clear. Lard, western steam, at $6.10 for spot lots; $6.07½@6.10 for January; $6.10@6.12½ for February; $6.15@6.17½ for March; $6.20@6.22½ for April, and $6.22½@6.25 for May. Stearine at 8¼. for prime. Tallow at 5¾ for prime. Beef Hams at $14.50@14.75 for Western. Beef, extra India mess, $21 for city brands; do. Philadelphia, $18.00@19; packet at $11@11.50; plain mess at $10@10.50; extra mess at $10.50@11.50.

SEED.—Grass is quiet; clover quoted 6¼@7c. for prime to strictly choice medium; timothy at $1.25@ 1.30. Flaxseed at $1.42½.

SUGAR—Refined at 9⅛@9¾c. for powdered, crushed and cut loaf; 8⅝@9c. for granulated; 7¾@8¾c. for soft white, and 6@7¾c. for soft yellow.

VEGETABLES.—Potatoes have had a start during the week and prices are firm at the close. Peach Blows scarce and wanted. Onions have advanced. Other vegetables firm with this date of winter.

Nova Scotia E. Rose, bulk, or 175 lbs. to bbl., $2.50@ 3 per bbl.; Poullic and Chili red, $2.25@2.50; P. E. I. Jackson whites, $2@2.25; Mercers, $1.75@2; Eastern E. Rose, with bbl., $2.50@3; State, $2.00@2 62; fair to good, $2@2.37; do. Peach Blow, choice, $2.75@3.12; common, $2.25@2.50; Pearless, choice, $2.37½@2.50; poor to good, $2@2.25. Sweet potatoes, Del., $2@2.25; Onions White, $2@2.75; red and yellow, $1.50@2; Chester $1.25@1.62. Hubbard and marrow squash, $2@2.25; Cabbage, $5@7 per 100. Cauliflower, bbl., $1.50@3. R. Turnips, 75@85c. Beets, 75c. Carrots, 75c. @$1. Celery, 60@75c. doz. Extras; hot-house Radishes, $3 ₱ 100 bunches; Cucumbers, $2.50@4 doz.; Mushrooms, 40@50c. lb. Lettuce, 50c. doz.

Exports, potatoes, past week, 1,010 bbls.; onions, 270.

WOOL.—There has been but little done since the opening of the year, but holders regard the market as in fairly good shape; with moderate stocks, confident of being able to support at least current prices.

Domestic Fleeces: Ohio, Pennsylvania and Virginia—XXX and picklock, 37@39c.; XX, 34@35c.; X, 33 @34c.; No. 1, 35@36c.; No. 2, 30@32c.; common, 28@30c.; combing and delaine, 36@38c.

New York, Michigan, Indiana and Wisconsin—XX, 31@32c.; X, 31@33c.; No. 1, 28@30c.; No. 2, 29@30c.; common, 27@28c.; combing and delaine, 31@ 7c.

Iowa, Vermont and Illinois—X and XX, 28@31c.; No. 1, 32@34c.; No. 2, 27@30c.; combing, 33@36c.

Missouri, Kentucky and Tennessee—Washed fleece, 26@31c; unwashed fleece, 21@26c.; unwashed combing, 2 @27c.

Stocks of wool in this city, January 1st, estimated 5,807,000 lbs., against 6,275,000 do. Jan. 1st, '78.

LIVE STOCK MARKETS.

Saturday, Jan. 11, 1879

BEEVES.—Receipts for the week, 6,817 head do.; last week, 10,295 do. Supplies have been extremely light. Stock has sold about as fast as it arrived, the closing range, 7@10c., dress 54@57 lbs. The top price was regarded a good one as nothing very extra in quality was showing. Exporters paid 9¾@10c. Fair quality native steers quoted 8c.

COWS AND CALVES—Arrivals are of no account; old prices $35@75 per head, nominal.

VEAL CALVES.—Demand for live light as dressed are abundant and easy. N. J. and Buck's Co., choice, 7c.; other, including State, 5½@6½c.; fed, 4@5c. Much of the dressed supply has arrived frozen, which hurt their sale the range is 5c. to 9c. for coarse to extra.

SHEEP AND LAMBS.—Receipts for the week, 15,971 head: do. last week, 19,358 do. The market shows some improvement for sheep as supplies have been moderate. Western range 4½@5¼c; N. J., including ewes, 4@5c. Lambs, 5¼@5¾c.

HOGS—Receipts for the week, 23,261 head: do., last week, 38,346 do. Fair to good Western hogs, nominally, $3 50@3.70 per 100 lbs.

Country dressed pork, light, 4¾@5¼c.; lean small pigs, 5¾c.; medium, 4¾@4½c.; heavy, 4c.; city, 4c. Pork tenderloins, 7c.

We take the following interesting table from the N. Y. World:

RULING PRICES IN CENTS PER LB. FOR PRIME BEEVES, SHEEP, LAMBS, SWINE AND DRESSED HOGS FOR EACH WEEK DURING THE YEAR 1878.

HORSFORD'S
Bread Preparation
UNSURPASSED FOR MAKING
LIGHT BREAD
Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Reading for the Young.

TALKS WITH THE CHILDREN—No. 2.

JENNIE E. J. ALGER.

DEAR LITTLE FRIENDS.—I have told you about the tiny Chinese shoe, but did not say what it was made of. Not of "French kid" or of thick, warm leather, but of silk or satin, embroidered with curious figures. Those I have seen were ornamented with what my baby niece called a "Cockel-do-del-do-o-o!" wrought with silk thread, and other curious pictures. They are sometimes embroidered with seed pearls. I think you will want to know how the little girls endure the torture of this cruel fashion. Strange as it may seem, some of them are anxious to have it begun, because they wish to be fashionable. Sometimes their feet will ache so badly that they will slyly slip off the bandages, which are replaced, however, as soon as this is discovered by the older members of the family.

A missionary, when writing one day, was much disturbed and distressed by the piteous crying of a child. When he could stand it no longer, he laid down his pen and went around the corner into a narrow, dirty alley, to find out what the trouble was. The child cried, "O Auntie, Auntie, don't do so, it hurts; it hurts so much! O-o-oh!" He pushed open a door that led into a court-yard, and there, on a high bench, sat a little girl about five years old. Her feet were dangling half-way to the ground, and the tears were pouring down her flushed cheeks. Seated in a chair near her was that dreadful Auntie, who held one of the child's feet in her hand, while the other hung down, so tightly bandaged that it looked more like a large pear, tied up in blue cotton cloth, than a naturally shaped foot. The old Auntie (I should call her a very naughty one) was looking very carefully at the other foot, especially the places where the little toes had been turned under. These parts were full of cracks and sores, into which she put powdered saltpetre to keep them from mortifying. Then she bound them up again and left the poor little thing sitting on the high bench, crying.

Rev. Mr. Houghton says that the skin often cracks or bursts just over the instep, and severe disease sets in; and, as it would be considered very dishonorable to have the foot cut off, it is not allowed, and the little sufferer soon dies. This seems terrible to us; but, I am sorry to say that we, or many of the ladies and girls of America, have a custom which is as bad (the Chinese say worse) and kills as many, to say the least. I hope no little girl who reads these letters will ever adopt the waist-pinching process. The bandages which are put upon the feet of the Chinese girls, must be worn all through their lives, as it would be impossible for them to move at all without them. Of course these beautiful (?) looted creatures can do no work. This is done by servants or other members of the household, who have natural feet. Not only the daughters of the rich people, but those of the poor mechanics, day laborers and farmers, have their feet bound, as the poor people think if their daughters have small feet, they may marry rich men and live without work.

It seems that the girls sometimes, if not always, make their own shoes, for, in the "Girls' Classic," which is written for their instruction, we find that they are commanded to "diligently make shoes or sew seams." In this we also find the question, "Why are your feet bound?" and the answer, "Not because it looks well for them to be arched as a bow, but to prevent your constantly going out of the house-door; therefore they have a thousand bandages and ten thousand wraps."

One would not think that a person with such small feet could go over very much ground in a day, but it is said that they will walk ten or twelve miles in that time on their way to and from some sacred temple, or when making visits to their friends. On their way to some temple, I say, for they worship idols. You would be surprised if you could see a collection of idols from different heathen lands. I have seen some no larger than the end of your little finger, and they are all the way from that size up to the large ones found only in temples. Horrible looking images they are, too; I have never seen a good-looking one. Nothing but the light of the Bible and the teachings of the Gospel will banish idol-worship. I hope you will help to give them these that they may learn the way to Heaven.

THE ANSWERS.

THE success of my questions, and the interest shown in the competition are very gratifying. I only regret that I cannot give a book to every competitor. Many of the unsuccessful aspirants have answered their questions comprehensively and in a way that indicated that they had thought twice on the subject. Others have been very careless, as for instance, giving the number of square inches instead of feet in an acre. Again, those who had started out on the right path failed because they did not keep to the strict limitations of the question. This was particularly the case in questions five and ten, and I have stretched a point by giving fractions of a mark when but a part of the question was correctly answered. I regret, also, to have to discriminate against two competitors, throwing out their answers; not being subscribers they are manifestly not entitled to participate in the competition. One young gentlemen writes me that he "indeavered" to supply correct answers, but it is plain why he failed. I only regret one circumstance, and that is that I did not put more difficult questions; but that can be easily remedied in the future.

The prize winners are Miss S. M. Potter, Syracuse, N. Y., and Miss Mary Jack, Chateauguay Basin, Canada. I shall give Miss Jack's answers, as I consider them the best received, and it is unfortunate she should not have remembered that Harley, Earl of Oxford, and not Sir John Blount was the originator of one of the greatest swindling schemes on record. The prizes will be mailed to-day, and I should like to send in the same package the felicitations of UNCLE TRUE.

ANSWERS BY MISS JACK.

1. Tennyson's Princess.
2. From zoon, animal, and logos, a discourse.
3. 43,560 square feet.
4. Byron.
5. Lucius Junius had received an excellent education from his father and had, naturally, strong sense and an inflexible attachment to virtue, but knowing that Tarquin had murdered his father and eldest brother, he counterfeited a fool in order to escape the same danger and obtained the surname Brutus.
6. Jason was a prince of Thessaly, who, with the aid of Medea, brought away from Colchis the Golden Fleece, which was guarded by a sleepless dragon.
7. By the first, the waters of Egypt were turned into blood; by the second, the frogs were sent in such numbers that they literally covered the land; by the third, the dust of the land became lice, on man and beast; by the fourth, a swarm of flies grievously infected Egypt; by the fifth, a murrain or distemper among the cattle, of which most of them died; by the sixth, the Egyptians, both man and beast, were afflicted with boils; by the seventh, God caused a very grievous hail—such as had not been in Egypt from the foundation thereof until that time, to fall upon man and beast; by the eighth, innumerable locusts destroyed the vegetation and ate up every blade of grass, nothing green remaining; by the ninth, thick darkness prevailed over Egypt for three days; by the tenth, which was yet more dreadful, more immediately affecting Pharaoh, for at mid-night the Lord smote all the first-born in the land of Egypt;—there was not a house in which there was not one dead.
8. Sir John Blount.
9. 6,069,000,000,000,000,000,000 tons.
10. Charles Mackay says, of "Tubal Cain," "And he sang—

"Hurrah, for my handiwork!"
And the red sparks lit the air
Not alone for the blade was the bright steel made,
And fashioned the first plowshare.

The first plows were said to be of wood—something like a forked stick.

I enclose a sketch of a wooden plow, used in Canada fifty years ago.

CULTIVATE GOOD MANNERS.

UNCLE TRUE.

I AM especially desirous that all the Cousins should be ladylike and gentlemanly in their conduct. By this I do not mean to say that they are not so, but we all know that even the best people may occasionally say or do things for which they afterward are sorry. It is mistakes of this kind I wish to guard against.

You will no doubt agree with me when I say that this may best be done by forming proper habits and manners in childhood and establishing them so firmly that one will do the right thing automatically and without effort.

The Scandinavians have a saying, "Hvad man I Ungdommen nemmer, man sjelden I Alderdommen glemmer," that is, whatever habits, manners or lessons are learned in youth, are apt to cling to one through life. (It might be translated, "As the twig is bent the tree is inclined.")

This being true, and knowing that those who are always pleasing and agreeable will get along in the world much better than the uncouth or careless, you will understand the importance of attending to these apparent trifles.

Just notice two boys, the one rude, noisy, selfish and overbearing, the other polite, respectful and pleasing in his manner, and of the two you have no hesitation in choosing the latter for your friend, while you naturally avoid the company of the former. It is exactly the same way among grown people. A true gentleman may always be recognized by his good manners, and his respect for the rights and feelings of others. But I did not mean to "lecture" you. Hoping, however, you will think of these things, I add a few rules of conduct which are often violated:

Shut every door after you, without slamming it. Never stamp, jump or run in the house.

Never call to persons up-stairs, or in the next room. If you wish to speak to them, go quietly where they are.

Always speak kindly and politely to others, especially to your playmates, if you would have them do the same to you.

When told to do, or not to do a thing, by either of your parents, never ask why you should or should not do it.

Tell of your own faults, not of those of your brothers and sisters.

Carefully clean the mud or snow from your boots or shoes before entering the house.

Be prompt at every meal.

Never sit down at the table, or in the parlor, with dirty hands, or with uncombed or tumbled hair.

Never interrupt any conversation, but wait patiently for your turn to speak.

Never reserve your good manners for strangers, but be equally polite at home and abroad.

Let your first, last and best confident be your mother.

Never smoke, chew nor snuff tobacco in any form, on the streets, or in any public conveyance, or in any place whatsoever.

TO OLD AND YOUNG.

WE publish the following extract of a letter from M. Oakey, A. M., Principal of Jamesburg Institute, Jamesburg, N. J., because we sincerely concur with his views, and desire to call the attention of our readers to the subject. Having mentioned some business matter, he says:

"If suggestions are not out of place, (I know how many different courses of advice a journal *feasts* upon as an annual diet), I would like to give you a hint here, at what seems to me to be a field unoccupied at present. It seems unkind to hint at anything further, after the improvements you have made, for I think you are earnestly and really working for the good, and not only the dollars, of your subscribers. These youths (meaning farmer's boys) ought to be attracted to the RURAL.

"First, because it is better to furnish them with improved 'notions' of farming before they are prejudiced towards 'father's ways.'

"Second, they need the wholesome influences which the RURAL exerts upon its readers—most all of the current literature put in their hands unfits them for steady toil and tends to fret them under their necessary labor. I have long used the 'moral' and 'homelike' illustrated periodicals as assistants in their education. It is wonderfully efficient.

"Third, and perhaps the strongest reason for the RURAL is, that the RURAL would secure lasting friends in those who grow up with it as an associate, and thus a broad foundation is laid for future and continued success. If a man tells a neighbor he has taken 'such and such a paper for so many years,' he uses the most powerful argument possible for the paper's acceptance and spread. I know you have a column devoted to 'Reading for the Young,' but it has not in the past occupied the prominent position I would suggest for it."

Now, it is our desire to make the "Reading for the Young" as instructive, interesting and admirable as it is possible to make it; and to this end we invite suggestions from all of our readers, who are interested in this department of the RURAL. It should please us much if parents would show their interest in the subject by writing to us, and inducing their children to do the same. Uncle True will be glad to answer through the RURAL, as far as space will permit, all intelligent questions put to him by his many relatives.

SINGULAR HANDWRITING.

PROMINENT among distinguished living Americans is the young inventor, Prof. Edison. He has invented a style of writing, which though peculiar, is capable, in his hands, of being written with great rapidity. While in Virginia City, Nev., the Professor stepped into a telegraph office and gave an exhibition of his penmanship. A local paper thus describes it:

One of the boys asked him to put his name in an autograph album. He wrote a line that looked like print, and signed his name to the bottom. Everybody admired the marvellous penmanship, which was emphatically, a new style. The letters were awkwardly made, taken singly, but when grouped in a line, all looked exactly alike as if engraved on copper-plate.

"You couldn't take thirty words a minute and print like that," said one. "I can take forty," was the reply. The fastest operator present took one end of a wire, and Edison, sitting at the receiver, picked up a sheet of paper and said, "Let the message come." He sat there three minutes and took one hundred and thirty words with apparent ease, doing better than he promised. The dispatch was written in the faultless hand that graced the autograph album.

Practice and care at any endeavor, will give one proficiency like that.—American Rural Home.

"WANTED, A BOY!"

A TRADESMAN once advertised in the morning papers for a boy to work in the shop, run errands, and make himself generally useful. In a few hours the shop was thronged with boys of all ages, sizes sorts and conditions, all wanting to find a situation.

The shopkeeper only wanted ONE boy, but how to get the right one was the great difficulty. He thought he must find some plan to lessen the number of applicants, and give him a better opportunity of selecting a good one. So he sent them *all* away, and thought the matter over a little. The next morning the papers contained the following advertisement:

"WANTED, A BOY WHO OBEYS HIS MOTHER!"

Now, then, thought the tradesman, I shall see soon who will apply. He also put a bill in his window with these words on it. And how many do you suppose did come? The story is that there were only two of all the numerous boys seeking employment in that big city who felt that they could honestly come and say, "*I obey my mother.*"

The crowd of lads was indeed quickly thinned out most effectually, and the tradesman had not much trouble in selecting a boy.

Such boys as these—boys that obey their mothers—are in great demand. My little boy, if you saw an advertisement for such a boy, could you truthfully go and offer yourself for the situation? If not, I fear there is something wrong about you. Look to the matter; seek the Lord's salvation; be an obedient son, and God will bless you—*Children's Friend.*

AN OLD "SETTING" CAT.

FANCY the amazement of a mother-cat at having fifteen added to her family in the mysterious way here related:

At a farm-house not far from Newton Stewart, Orange County, Ind., a rather uncommon circumstance took place recently. A hen's nest had been made in an out-of-the way place, in which eggs to the number of seventeen had been laid. The cat took possession of the nest, covered the eggs over with straw, and there brought forth kittens. Puss and the kittens remained in the nest for a considerable time, and the result was that fifteen out of the seventeen eggs sent out birds. The cat was seen lying with its brood, but no one ever saw a hen near the nest, or knew the eggs were there until the birds came out. The gude wife was "uncoly ta'en" when the fifteen chickens presented themselves.—*Louisville Paper.*

Sabbath Reading.

HYMN.

REV. WASHINGTON GLADDEN.

LORD, I believe in Thee,
In want, in pain, in grief;
I trust Thee where I cannot see;
Help Thou my unbelief!

Thy law is in my heart;
With that I follow Thee;
If sin still rule the worser part,
Be merciful to me!

I trust my brother, too;
In him, though lost, I find
Some spark Thy breath may yet renew;
For Thou to him art kind.

All that are Thine are mine;
To save men Thou didst come;
Live in my life, O Love divine,
Then I, too, may save some.

[*Sunday Afternoon.*

THE APOSTLES' CREED.

I BELIEVE in God the Father Almighty, Maker of heaven and earth:

And in Jesus Christ his only Son our Lord; Who was conceived by the Holy Ghost; born of the Virgin Mary; suffered under Pontius Pilate; was crucified, dead and buried; He descended into hell; the third day he He rose from the dead; He ascended into heaven; and sitteth on the right hand of God the Father Almighty; from thence He shall come to judge the quick and the dead:

I believe in the Holy Ghost; the holy Catholic church; the communion of saints; the forgiveness of sins; the resurrection of the body; and the life everlasting. Amen.

SUPPLEMENTARY "CREDOS."

[Edward Everett Hale in a Recent Discourse.]

I HAVE no other objection to the so-called Apostles' Creed than that most people of to-day take it in much that fashion. For myself, I understand its words; and, so far as they go, I have no objection to the use of them, if you can only make people see that they go only to the statement of a part of the faith of the second century, when this creed got itself written. I have often repeated it in religious service. But I never repeat it without the wish that the decorum of the place would permit me to add aloud, what in my own heart I do add, "I believe all that; and, thank God, I believe a great deal more." I observe, for instance, that whoever made the Apostles' Creed omitted all reference to man's duty to man, which is, in truth, an essential part of religion. Some expression of it belongs in any statement of religion. And if I had the Apostles' Creed to repeat to-day, I should like to add to it the creed of one disciple of to-day. I should like to speak of a few of the duties which press on us now and here. I should like to say, for instance, for myself:—

I believe that every exile, on arrival here, should be welcomed at the pier, and the way made easy for him to his new home.

I believe that, in practical methods, the state should give a homestead to each husband and wife who are willing to work upon it to produce their daily bread.

I believe that the state should offer an education to every child born in it,—as good for the child of the beggar as the child of the prince.

I believe that every man has a duty to the state, and that no man should give up to party what was meant for mankind.

I believe that the blackman and the red man should be truly enfranchised, and have the same rights before the state as the whitest of us all.

I believe that every woman should be as pure as the mother of Christ, and that society should throw around woman every protection and help for such purity.

I believe that every man should be as pure as every woman.

I believe that every man tempted by liquor should receive from every one around him all possible help, protection and care.

I believe, thus, in the gradual abolition of sickness, disease, and famine; for

I believe, that the average age of man should be three-score years and ten.

That will do for a beginning. Such a statement as that expresses, in the language of to-day to the people of to-day, a part of the duty of to-day as it appears to men who live in the life of the large cities of to-day.—Springfield Republican.

MERCY is like the rainbow, we must never look for it after night; it shines not in the other world; if we refuse it here we must have justice in eternity.—*Bp. Taylor.*

FILLING up time with and for God, is the way to rise up and lie down in peace.—*Brainerd.*

As the shadow of the sun is largest when his beams are lowest, so we are always least when we make ourselves the greatest.—*Seeker.*

THE more believers love God, the more they love one another; as the lines of a circle, the nearer they are to the center, the nearer they are to each other.—*Charnock.*

A GOOD conscience is the palace of Christ, the temple of the Holy Ghost, the paradise of delight, and the standing Sabbath of the saints.—*Augustine*

No moment should be allowed to pass unimproved; for if *once lost*, it is *lost for ever*.—*Rev. R. Ray.*

WE wish it to be distinctly understood that we do not endorse all the religious ideas published in this column, our object is to give matter which will stimulate our readers to study questions of conscience and conduct for themselves.—EDS.

PERSONAL ITEMS.

Two daughters of Senator Sargent of California are studying medicine at the Howard University.

"I notice," said Prince Metternich to his wife, the best dressed woman of the second Empire, "that your bonnets grow smaller and smaller, and the hills larger and larger. One of these days the maker will bring nothing but the bill."

Alfred Ballard, a negro, was converted to Methodism in Jackson, Tenn. He conceived that his mission was to reform gamblers, and he became insane on that subject. Dashing into a faro room, he shouted, "Death to all gamblers!" and shot the dealer dead.

A lucky family is that of the Barings. The founder of the family was a trader in Exeter, England, a hundred years ago, and now the family holds a baronetcy, a baronage, a bishopric, and an earldom, possesses immense wealth, and has sixty livings in its gift.

"Old Abe," the Wisconsin war eagle, has earned over $50,000 for all sorts of societies by the sale of photographs, histories, and entrance fees to fairs, a fact that may account for the report that the present bird is a fraud, the old Simon Pure having died some time ago.

The only male descendant of the poet Burns now living is Robert Burns Hutchinson, a tea planter in Assam, India. The daughter of Burns' eldest son, Mrs. Eliza Burns Everitt, died at Bath, England, three or four weeks ago. Her only child, Martha Burns Everitt, is unmarried

M. Gabriel Ibrahim, the last survivor of the Mameluke Corps formed in Egypt by Napoleon, has just died at Marseilles, where thirteen of that body were massacred by the Royalist mob eleven days after the battle of Waterloo. He was 84 years of age, and had long been a Roman Catholic.

James A. Whistler, the London artist, is the son of G. W. Whistler, once an engineer connected with the Stonington and Boston road. The father went to Russia, and his painter son was born at St. Petersburg, about 1834. The son entered West Point in 1851, and as a soldier was not a success.

Lady Sophia Macnamarra, who accompanies Princess Louise, is an Irish girl from Kerry, a sister of Lord Lisiowel, who was long a lord in waiting on the Queen. She herself was a maid of honor, and as such formed a friendship with the Princess. She is the wife of a plain English squire of fair fortune.

Francis J. Oliver of Somerville, Mass., kept a candy store, and about the sweetest thing in it was Grace Matthews, the clerk. Although Mr. Oliver was 77 years of age, and she only 20, he thought she meant it when she promised to marry him. He gave her $50 to buy a wedding dress, and she went out as though to make the purchase but never returned.

Frankie Chapman, daughter of a Methodist clergyman in Jackson, Ohio, went to a public ball in Cincinnati, where she had been living, and drank so much wine with a friend, Miss Agans, that she became intoxicated. They went home together, quarreled, fought, and Miss Chapman killed her antagonist by striking her on the head with a pitcher.

James Brooks had for several years got drunk on New Year's Day in Bismarck, Dakota, and rather than break the custom, he rode sixty miles on horseback on Dec. 31, 1878. He lost no time after his arrival, but began his annual frolic immediately in a dance hall, and was soon drunk and quarrelsome. He bullied everybody in the place except one woman, and she, when he struck her, shot him dead.

The first monarch in France who attempted to put down dueling with a strong hand was Henry IV. and there still exists a report of Sully on this matter, which says: "Since your Majesty ascended the throne four thousand gentlemen have been killed in single combat" Henry IV proposed that all quarrels between gentlemen be referred to a committee of Marshals.

An English footman named Foster, long in the service of the Duc de Nemours, having embraced the Roman Catholic Faith a few moments before his death, was baptized, immediately afterward receiving extreme unction. His funeral a few days ago was attended by the Duc de Nemours, the Princess Blanche of Orleans, Prince and Princess Czartoryski, and the Comte and Countess d'Eu,

The Emperor of Austria, at his summer retreat at Ischl, is an inveterate smoker, and has on the writing table of his bedroom a number of long, coarse Virginia cigars. The Emperor is tall and spare, with close-cropped sandy hair, just turning iron gray; regulation military whiskers and mustache; small, restless gray eyes; blunt features and heavy lips, and he wears the light blue uniform of a general. He speaks six languages.

Father Hyacinthe has hired a small farm house at Neuilly, near Paris and intends to reside there permanently. An English society of Roman Catholics, who approve of the marriage of priests, have offered to build a chapel there for him, and to furnish funds for a paper to be called the *Old Catholic*, of which he shall be editor. He has refused both offers, and proposes preaching in Paris if he can obtain permission from the civil authorities to do so.

John Olive, a Nebraska herder, had murdered several of his enemies, and it was deemed desirable to arrest him, but it was hard to get anybody to undertake the job. He always had a gang of his ranchmen close at hand, and was free with threats of vengeance on anybody who molested him. At length Billy Nicholls bargained to capture Olive for $500. It was Olive's custom to go to Plum Creek once a week for letters. Nicholls stationed himself in the Post-Office, with four companions chosen from the relatives of the men whom Olive had killed. When Olive entered he found himself looking into the muzzles of five revolvers, and was commanded to hold up his hands. He surrendered, and was quickly hustled out of sight. His ranchmen, as they straggled in one by one to see what had become of him, were caught in the same manner.

Harry Worn discovered in San Francisco, seven years ago, that Anna Morris, whom he was to marry, had also a matrimonial engagement with another man. Harry had given her $7,000 worth of jewelry, clothes, and money, showing how much he loved her, but on learning of her deception he said decisively that she could never be his wife. She thought differently and threatened to shoot him if he discarded her. To avoid trouble he came to New York. She followed, showed him a pistol that she had bought, and declared that she would kill him if he did not marry her. He fled to Buffalo and for four years did not see her; but she turned up at length, and renewed her threats. He appeased her with $500, and went to Chicago. He met her in the street a few days ago. She asked him if he was ready to marry her. He said no. She coolly put her hand under her sealskin sack, and drew out the same old pistol. He seized her, but she wriggled away through the crowd that had gathered, and escaped. But Mr. Worn expects to see her again.

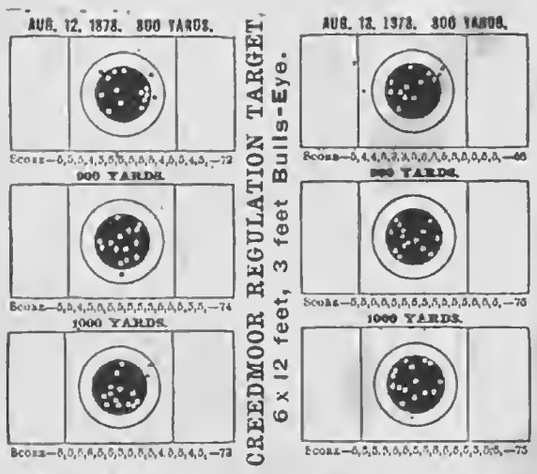
MAYNARD CREEDMOOR RIFLE.

The Maynard Ahead.

The following Targets were made by Prof. CHAS H. DWIGHT of Wheeling, West Va., on Woodland Range, August 12th and 13th, 1878, with a *Maynard Land Range Rifle*, and are the MOST REMARKABLE ON RECORD. The grand total of 437 in a possible 450,—90 shots at the long ranges,—has never before been accomplished by any Rifleman, or Rifle, in the world.

These scores were made in the competition for position on the American team for 1878; open to all native-born citizens of the United States, and were shot under the rules of the N. R. A., Fulton position, no sighting shots at either distance. These scores were all witnessed and sworn to by JAMES D. STANTON, Secretary *Maynard Rifle Club*, Wheeling, West Va.



THE MAYNARD ARMS are the most perfect in workmanship as well as accuracy, of any make in the world, *particular attention being paid to the fine shooting as well as the mechanical qualities of the Arms.* For full particulars and price list, address

A PERFECT HORSE SHOE.
THE JOHN D. BILLINGS PATENT MACHINE-

rolled Horse Shoe, with continuous Calk—patented 1877—is a combination of steel and iron; the body of the shoe being of solid steel, completely enveloped by a coating of tough iron, makes it elastic, tough and hard; can be bent hot or cold; this is an entirely new material for horse shoes, and the process for making it patented. This shoe prevents interfering—cures quarter crack, corn lameness, tender and contracted feet. Acknowledged by all to be *the best shoe in the world.* Will outwear two sets of the old style shoes. Trial set (4), with nails, $1; to measure, place hoof on paper and draw line around with pencil. A chance is offered for reliable and energetic men to secure territory. Send for Illustrated Pamphlet. THE JOHN D. BILLINGS PATENT HORSE SHOE CO., 265 Broadway, New York.

FAMILIAR RELATIONS.

A LITTLE *father* o'er the stile
As James would fain a *sister*—
As eke some *mother* lads would do—
He bent him down and kiss'd her.

The maiden cried, "*Aunt* you a wretch
To treat a girl so badly?
You'd *daughter* be ashamed, I say,
To *cousin* me so sadly!"

AN old proverb says that "the anvil lasts longer than the hammer." This is probably the only consolation the undermost man in a fight has.

A VERY fat man sent an order to the office for two seats in the coach for himself. The clerk engaged him one seat outside and the other inside.

A NEVADA politician was elected on the merits of a single speech. All he said was, "Fellow-countrymen, follow me to yonder refreshment saloon!"

AN exchange, speaking of young ladies, says it wants "more kitchen and less parlor; more pudding and less pianos." More sass is what the chap wants, with a broomstick thrown in.

"Is that the second bell?" inquired a gentleman of a colored porter. "No, sah," answered the porter, "dat am the second ringin' ov de fust bell. We hab but one bell in dis establishmum."

WHEN we see a streak of black on the cook's cheek, just after the coal man has been putting the winter supply of fuel into the cellar, we are led to infer that he turned a coaled shoulder on her.—*Ex.*

A WESTERN paper remarks in its financial analysis that money is so plentiful that young men are wearing pantaloons with checks on them. And when money is scarce probably there will be drafts through them.

AFTER all, a man never fully appreciates those voluminous dolmans of the ladies until he takes a moonlight promenade with the wearer and notices how effectually it conceals, from those behind, the exact whereabouts of his arm.

"TEDDY, me boy," said an Irishman to his nephew, "jist guess how many cheese there is in this here bag, an' faith I'll give ye the whole five." "Five," answered Teddy. "Arrah, by my sowl, bad luck to the man that tould ye!" exclaimed the uncle.

THE Austrian-Bosnian question has been thus cleverly hit off. Two Parisian *gamins* are conversing. "A Congress — what is it?" "Well, this. I want to do something for you, so I give you that gentleman's watch and chain. Now it is for you to go and take it."

STRANGER (in back seats of new hall to architect whom he does not recognise): "The acoustic principles of this hall must be villanously bad. I cannot hear a word the performers are saying." Architect (spitefully): "What can you expect? They're amateurs." Stranger: "I suspect its the architect who's the amateur." Architect collapses.

A SCOTCH gentleman plagued by poachers procured a cork-leg dressed in a stocking and shoe, and sent it through the neighboring village by the town crier, who proclaimed that it had been found in a man-trap on the previous night in Mr. Ross's grounds, who desired to return it to the owner. There was no more poaching after that.

THE Bishop preached. The congregation subsequently requested him to publish his sermon. The Bishop was greatly delighted. "And so," said he, with jocose affability, to the senior churchwarden, "the people were much pleased, eh?" "Well, you see, sir," replied the official, "our folks would like to know about it, and—" "Ah," interposed the Bishop complacently, "I see—they'd like to read it at home?" "Well, sir, that's what they would all like." Here he paused, and then added confidentially, "It was very hot, you see, and so, when you were preachin' many of 'em were asleep!"

Suffering for a Life Time.

Persons afflicted with rheumatism often suffer for a life-time, their tortures being almost without remission. The joints and muscles of such unfortunates are in most cases shockingly contorted and drawn out of shape. To afford them even temporary relief, the ordinary remedies often prove utterly useless. Hostetter's Stomach Bitters, on the other hand, is avouched, by persons who have used it, to be a genuine source of relief. It keeps the blood cool by promoting a regular habit of body, and removes from it impurities which, in the opinion of all rational pathologists, originate this agonizing complaint and its kindred malady, the gout. Besides this the Bitters remedy disorders of the stomach, liver and nerves, prevent and eradicate intermittent and remittent fevers, promote appetite and sleep, and are highly recommended by physicians as a desirable medicinal stimulant and tonic.

CIDER PRESSES AND GRATERS. BOOMER & BOSC WINE PRESS CO. Syracuse, N.Y.

WHAT IS IN A BAD BOY'S HEAD.

LIGHTNING HAY KNIVES.

WEYMOUTH'S PATENT.

This Knife is the best in use for cutting down hay and straw in mow and stack, cutting fine feed from bale, cutting corn stalks for feed, cutting peat and ditching marshes.

The blade is best cast steel, spring temper, easily sharpened, and is giving *universal* satisfaction. A few moments' trial will show its merits, and parties once using it are unwilling to do without it. Its sales are fast increasing for export as well as home trade, and it *seems destined* to take the place of all other Hay Knives.

They are nicely packed in boxes, one dozen each, of 50 lbs. weight, suitable for shipping by land or water to any part of the world.

Manufactured only by

HIRAM HOLT & CO.,
East Wilton, Franklin Co., Maine.

A PATENT GATE IN COMMON USE.

PROFESSOR R. C. CARPENTER.

FORM OF A COMMON GATE ON WHICH ROYALTY IS CLAIMED.

Throughout the whole of Michigan and probably a great portion of the United States, a gate is in common use, which is opened by sliding back until it reaches a balanced position, and then by swinging one-quarter around. One form of this gate is shown in Fig. 1 and other forms at Figs. 4 and 6. From these diagrams it is seen that the gate is exceedingly simple in construction, being little more than a fence panel supported by strips, so as to allow both sliding and rotary motions. Fig. 1 is a copy of a drawing published in the American Agriculturist for November 1864. In this case the posts A, A' are set so nearly in a line with the gate, that the strips d' and d, when nailed to the posts, as shown in the drawing,

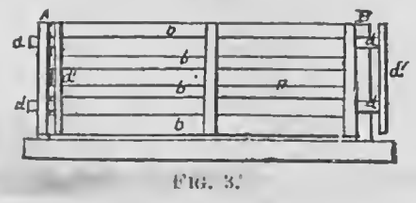

FIG. 3.

are made parallel with the gate. If the strips d, d' are but a trifle thicker than the boards from which the gate is made, the gate may be readily pushed back in a direct line, and then rotated by swinging the gate to the right (see Fig. 1). The posts are usually set as C' and D' in Fig. 6, or as A and B in Fig. 7; but in all these cases, except that shown by Fig. 7, whether the posts are in a parallel, perpendicular, or oblique line to the gate, and whether one or two slats connect them, the method of opening remains the same—first sliding to a balanced position and then turning one-quarter around. From this method of opening, the gate received the name of the "slide" or "slip" gate, to distinguish it from the ordinary swinging gate.

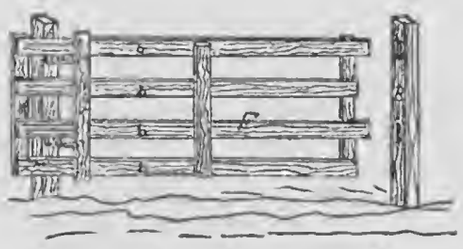

FIG. 4.—LEE'S GATE FROM HIS MODEL.

The *slide* gate possesses many advantages over the ordinary gate, which, concisely stated, are as follows: First, it is cheaper and more easily constructed; second, it is less liable to get out of order, as its method of swinging when in a balanced position, throws very little strain on any of its parts; third, it is less liable to be obstructed by snow, and, on the whole, works easier than the ordinary swing gate.

The details by means of which the gate is held in a closed position are by no means uniform. Fig. 1 shows the gate held by a single mortised post; Fig. 2 shows the method in common use, which is a combination of a post (A), slats (a, b, c,) nailed to the post and a strip or piece of board (B) nailed to the slats (a, b, c), the ends of the gate slip into the open spaces between the post A and the board or strip B. Fig. 4 shows the use of a double mortised post (B) which holds the gate by receiving the ends of two of its strips. Fig. 6 shows the use of two posts which hold the gate in essentially the same manner as shown in Fig. 2. There are still other methods of holding the gate closed; but to these it is not necessary to call attention. This gate in some form is to be found on the farm of almost every farmer in the State of Michigan, and before the beginning of 1878, it was generally supposed to be free from any patented device and even to be unpatentable.

THE LEE PATENT.

During the early portion of the year 1878, the farmers of Wayne and Washtenaw counties were considerably surprised by being called on to pay royalty on the gate. A party of men banded together at Ypsilanti, bought the State-right of a patent granted to John

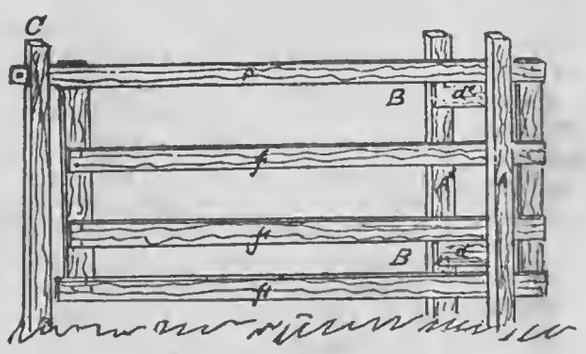

FIG. 1.—SLIDE GATE.

C. Lee, of Seville, Ohio. This they claimed covered the ordinary slide gate. They established headquarters in Ypsilanti, employed agents to whom they paid handsome salaries, and sent them forth over the State to collect royalties.

Their method of operating was as follows: They called on a farmer using the gate, claimed to own the right, and made their demands; if they could frighten the farmer sufficiently, they collected the following amounts: For a farm not exceeding 60 acres, $3; not exceeding 100 acres, $5; not exceeding 160 acres, $8; 240 acres and over, $10. In order to intimidate him they also resorted to the device of serving on him a notification of suit, but until very recently they have actually commenced no prosecution.

It is needless to say that they obtained a good deal of money, as many farmers would pay the fee demanded rather than stand the cost of a lawsuit. Many of the farmers, however, felt that the demand was unjust, and through their granges and farmers' clubs banded together to resist the payment of royalty on the ordinary slide gate. Mr. H. D. Platt, an enterprising farmer of Ypsilanti, has up to this time taken the most active part in opposing the payment of this royalty. He even visited the inventor, Mr. J. C. Lee, and obtained from him an affidavit certifying that the patent granted to him was for an improvement on the slide gate (Fig. 4) by means of which one post was dispensed with, and that his patent covered simply the improvement. The following is Lee's affidavit:

THE STATE OF OHIO, Medina County. } ss.

John C. Lee, of Seville, in said county of Medina, being first duly sworn, says that letters patents were issued to him numbered 50,605, dated October 24, A. D. 1865, for an improvement in a gate, known as the two-post gate, and that my improvement consisted in the dispensing with one post and the cross slats, and in the use of a strip perpendicular with the post and slats running parallel with the gate; and further saith that the two-post gate was in common use in this county at the time my patent was issued to me; and further, this affidavit saith that the facts stated in this affidavit are true, as he verily believes.

JOHN C. LEE.

Sworn to by the said John C. Lee before me and subscribed by him in my presence; and I further certify that the said John C. Lee is well known to me to be the person he represents himself to be. CHAUNCEY SPEAR.
Justice of the Peace for said county of Medina, October 31, 1878.

FIG. 2.—POST.

Mr. Lee further claimed that he informed the parties to whom he sold his patent, that it did not cover the ordinary two-post slide gate as shown in Fig. 7 or in Fig. 6. Mr. Lee made a model for Mr. Platt which he claimed to be like the original one sent to his agent when he applied for a patent. The structure of this model is shown in Fig. 4, from which it is seen to be in every particular feature like the gate shown in Fig. 1, except that in place of one post (A or A') is a strip d'. The patent granted Mr. Lee is different in many essential features from this model, and it is extremely doubtful that a gate made after his model would even be an infringement on his patent (Mr. Lee lays this discrepancy to his patent agents); for his patent is based entirely on a combination which exists in part only in his model.

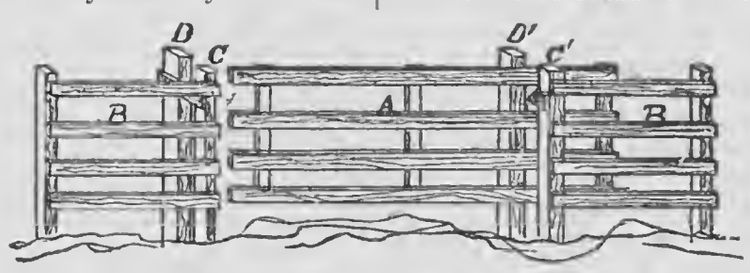

FIG. 6.—THE TEEL GATE, NO. 40777.

Fig. 3 is an accurate copy of the drawing of Lee's patent gate, as published in vol. III of the report of the United States Commissioner of Patents for 1865.

The following is an exact copy of the description of the patent granted to Lee:

No. 50,605—John C. Lee, Seville, Ohio.

Field Fence and Gate Combined, October 24, 1865.—This invention consists in the combination of the gate with the posts and fence, one of the said posts being slotted to receive the ends of the panels of the gate when closed.

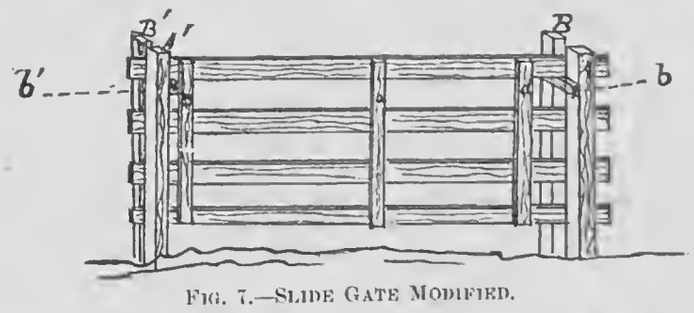

FIG. 7.—SLIDE GATE MODIFIED.

Claims.—The arrangement of the panel or gate F, in combination with the mortised post B, post A, strips d', slats d, as and for the purpose set forth.

In the construction of this gate the slats d—d are fastened to the posts (see Fig. 3). On the end of each set of these slats is nailed a strip (d' in Fig.), which is not connected with the ground. The gate is opened by sliding partially back over the slats fastened to post A, and then turning. Finally the post B is mortised, or slotted, to receive the end of the gate when closed.

There is no infringement on this patent unless a mortised post is combined with a fence panel, constructed with the strips d' and slats d, as arranged in the figure.

In the figure from Lee's model (Fig. 4), the strip d' and slats d', d, near post B, especially mentioned in the combination and shown in the drawing of the Patent Office (Fig. 3), do not exist, and hence it is doubtful if a gate made after Fig 4 would be considered an infringement on Lee's patent. Lee's patent is on an arrangement or combination, and there can be no infringement on this patent unless every essential portion of this arrangement or combination is copied, as shown in Fig. 3. According to Eaton S. Drone in American Cyclopædia, "A combination is not infringed by the use of one or more of its parts, if those parts are not specially patented, and if they do not substantially constitute the combination."

In order to be patented a combination "must be new and must produce a new and useful result, not due to the separate action of any one of the devices used, but to the co-operative action of all. In this case the patent protects only the combination and the new elements; anyone may use the old devices, either separately or in a new combination."

It is evident from this that there would be no infringement on Lee's patent unless this same combination of strips, slats and mortised post were used. No royalty could be collected from any person for using the slats d, d, with the strip d' fastened to them, provided he did not also use the mortised post B to receive the ends of the gate when closed. So far as I can learn, this improvement has never been infringed, for it is evident by comparing Fig. 1 and Fig. 3 or 4, that the old method of using two posts (no matter how frail) with slats nailed on them, affords better means of holding the gate than the improved method of dispensing with one post and using the strip d' unconnected with the ground. It is seen from the foregoing that the manufacture and use of the *slide* gate is not an infringement on the patent granted J. C. Lee.

No patent on the slide gate would have been valid, for it can be proved that the gate was in common use earlier than October, 1863, and again the gate was figured and described in the American Agriculturist of November, 1864, in an article from G. W. Taylor, of Ogle County, Ill. (See Fig. 1.)

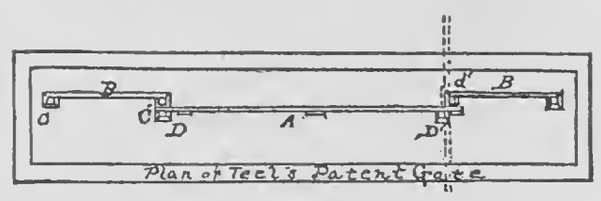

FIG. 5.

It is seen from section 24 of the United States Patent Laws, which is given in full, that either of the above conditions would prevent the issue of a valid patent.

WHAT MAY BE PATENTED—UNITED STATES PATENT LAWS.

"SECTION 24. *And be it further enacted*, that any person who has invented or discovered any new and useful art, machine, manufacture or composition of matter, or any new and useful improvement thereof, *not known or used by others in this country*, and not patented or *described in any printed publication* in this or any foreign country before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned, may, upon payment of the duty required by law, and other due proceedings had, obtain a patent therefor."

After information regarding Lee's patent had been generally circulated, the business of col-

leeting royalty beeame unprofitable, and a few suits were actually commenced in the courts. These were promptly met by the farmers, who required the prosecutors to give bond for the costs. To this date, no trial has taken place, and it is probable the prosecution of the suits will not be continued, as the plaintiffs are certain to be beaten. They have not by any means given up the idea of collecting royalty from all those who use the slide gate, but they have dropped the Lee patent, and propose to persecute the farmers with an entirely different patent, viz.: the Teel patent, the right of which the same parties claim to have bought.

THE TEEL PATENT.

not only covers the ordinary slide gate, but it covers all gates that open by sliding back to a balanced position and turning one-quarter aronnd; consequently it covers the Lee gate, and all those who paid the Ypsilanti firm for the right to use that gate, must still pay them for the right to use the Teel gate, before they actually have a legal right to use the ordinary, or in fact any gate that is opened in the manner described.

Fig. 5 is an exact copy of the drawing of Teel's gate, published in the Patent Office report for 1863, and the following are the description and claim as allowed by the Patent Office.

"No. 40777.—A. C. Teel, of Girard, Macoupin Co., Ill.—*Improvement in* FARM GATES.—Patent dated December 1, 1863.—This panel of fence is to hang upon strips attached to the neighboring panels, that it may be pushed in half the length of a panel and then swung one-quarter round so as to make an opening the length of a panel. CLAIM—The suspending of the gate A on strips d, d' attached to posts C D C' D' at the ends B, B, of the fence, substantially as shown, to admit of the sliding of the gate and the turning of the same for the purpose of opening and closing it as herein set forth."

The figure shows only the plan of the gate, and one letter, C, is evidently misplaced, but despite this, the patent secures to A. C. Teel all the essential features of the slide gate. Fig. 6 is an isometric drawing of Teel's patent gate with the letters C and C' in their proper places.

When an inventor can prove that the specifications do not cover his whole invention, the Patent Office allows him to restate the specifications, under the name of a "Reissue." A reissue does not extend the time of the patent, but after it is once granted, its specifications replace those of the original patent. July 2d, 1867, A. C. Teel took advantage of this law and obtained a "reissue," of which the following is an exact copy:

"2667.—A. C. Teel, Girard, Ill.—FARM GATE Patented December, 1st, 1863; Reissued July 2d, 1867.

CLAIM,—FIRST the hanging or suspending of a gate in such a manner that it will have a combined sliding and swinging movement in the opening and closing of the same, the gate sliding from a closed position or state to a central balanced state, and then swinging while in a state of equipoise to an open position, and closing from an open position by swinging around in a line with the gate-posts and sliding to a closed state, substantially as shown and described. SECOND, the placing of the gate-posts C' D C' D', in such a relative position with each other, and constructing and hanging the gate between them as to admit of the opening and closing of the gate, substantially as herein set forth."

In the reissue there are two claims independent of each other, and an infringement on either claim or both claims may be prosecuted. The first is given without reference to a figure, and covers all cases of gates that open by sliding back to a balanced position and then swinging open. The second refers to the peculiar arrangement of posts shown in Fig. 5 and Fig. 6 (a mistake in the second claim makes it read posts C' D C' D', for posts C D C' D'—this is not material, however.)

A GATE THAT IS NOT AN INFRINGEMENT.

There is a modified form of the slide gate which is not an infringement on Teel's patent. This is shown in Fig. 7. This form of a gate is preferred by Mr. H. D. Platt to the ordinary slide gate. It is seen that it slides back only far enough to disengage the ends of the gate from between the posts A' B' and then swings around, or it can be pulled out and set on one side. The arrangement of the posts may be somewhat modified, but the arrangement shown in Fig. 6, is patented by claim second in Teel's reissue and hence cannot be used without infringing.

ROYALTY

must be paid for every infringement up to the time the patent expires, December 1, 1880, unless the patent can be rendered void. If it can be proved that A. C. Teel was not the original inventor of the slide gate, the United States Courts will declare the patent invalid. Sec. 24 of the Patent Laws already published, states that if any invention has been in use two years prior to application for patent, the patent will be invalid. It is extremely probable that the gate was in extensive use prior to 1861 in this country. If that point can be proved, the Teel patent is worthless. Again, any publication in this or foreign countries describing the invention prior to Teel's application for a patent (probably Aug., 1863), would be sufficient to invalidate the patent. Any one who possesses evidence of its use prior to 1861, or of publication prior to 1863, would render material service by informing Mr. H. D. Platt of Ypsilanti, or the writer of this article, of the character of his information.

It may be remarked, in conclusion, that there is in possession of the organization to resist the payment of this royalty, reliable evidence of its use prior to 1861, but no evidence of printed description previous to 1864. More proof of its early use, though probably not needed, is still very much desired.

Michigan Agricultural College, Lansing, Mich.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

MR. FULTON, of Orange County, who has been a subscriber to the RURAL for twenty-five years, has recently purchased a yearling Jersey bull and he inquires if he shall put a ring in his nose, as he has heard that the Jerseys are inclined to be ugly. Putting a ring in a bull's nose does not of itself make him kind or prevent him from becoming vicious. It is only an aid in handling him. The proper and important thing to do is to break the bull when young, and have him in subjection. He should be halter-broken and taught to mind like an ox. When a year old, put a ring in his nose and lead him with a stout halter attached to it. This will do for ordinary occasions, but under other circumstances he should be led by a strong staff. Bulls should never be trifled with, or fondled about the head. No one should ever be allowed to touch their horns, however young they may be. They should not be approached in front, a bull does not like it. After serving a cow he should be *immediately* driven away, and the person in charge should always have a long, strong stick in his hand. Precautions are always wise in the management of bulls. They are especially dangerous when a cow is in heat in their vicinity.

We do not think Jersey bulls are any more inclined to be vicious than those of other breeds. They are often petted more than others when young, and this makes them more liable to injure their attendant. It is all very well to play with a calf's horns and have it jerk its head around and play back when its ears are pulled; but when the horns get longer, and the tendons of the neck get stronger, the same habit is likely to continue and the former pet may strike a blow or make a push with its head, which will do damage, and then if he is struck, it is the bull of it, to fight back. When a bull is not footed with, he will hold his head straight forward when a person is passing about him. Jersey cattle are naturally timid and nervous and must be gently treated. Knocking and cracking around a bull of this breed is offensive to him. When young he will try to run away, but when older he will naturally assert the rights of his bullship, and pitch in for a fight. Break the bull thoroughly to mind at the word, and then always afterwards be gentle but firm with him, and do not cross his nature, and not one in a hundred will be ugly. This has been our experience.

If a bull does get ugly, put a strong rope around his neck with a slipping noose and keep it on. He will never tighten it but once, and afterwards will stand quiet. If he is likely to choke to death at first, loosen it a little. We had a bull wear a slipping noose for four months, and although this was all the fastening he had, he never made it tight after the first tussle, when he choked down and gasped for breath.

James says, "the new plan is the best," and he can now do the chores in half of the time it took him before. A box of meal is now standing in one corner of the sheep pen where the old sheep are, and a dish is in it, so that he can feed their meal without its taking a half minute. The same is true of the calves, and the bran for the cows is handy by. This is better than running to the granary every time a measureful of feed is wanted.

Mr. Riley says his ruta-bagas were all necks, and are so strong they cannot eat them. This is because the seed was poor, that is, it was raised from imperfect turnips, or perhaps they were left standing in the ground all winter. All vegetables, when thus left, will run out. To bring good seed which will produce perfect roots, the vegetables designed for growing the seed must be taken up in the fall, kept healthy all winter, and then be reset in the spring. The stem of a ruta-baga is much ranker in flavor than the root itself, and where there is a preponderance of stem, or "neck," the turnip will invariably be strong in taste.

Webb's Imperial Swede is the purest and best variety we know of. Ours were free from necks and of choice flavor. We have sold a number of barrels for table use, enough to equal the whole cost of the crop. Those we sold brought 75 cents a barrel.

Mr. Callaghan says he "don't believe in eating rotten apples all of the time," so he picks out the sound ones and lets those that are speeked and partially decayed go to the pigs. He used to keep sorting them over and eating the specked ones, and by the time the first lot was gone another was ready, and so he had nothing but poor apples. Now he reverses the rule, and begins with the best and has the best all of the time. This is more comfortable, to say the least. The more apples are disturbed, the faster they will rot.

Farm Economy.

HOW TO APPLY MANURES.

WM. J. FOWLER.

Scattering manure on the surface in fall and winter; plowing under barnyard manure in spring; applying hen manure and gypsum; drilling commercial fertilizers with seed; need of thoroughly pulverizing the soil.

SUCCESSFUL farming depends so largely on making the soil rich that the best modes of doing this are necessarily matters of the first importance. The most natural mode is to apply manure on the surface and let rains and snows carry its substance to the roots of plants. I am not sure yet that we have bettered this plan. But long ago it was discovered that decaying manures lost some of their ammonia by evaporation, and it was naturally supposed that unless this decomposition occurred in the soil, this ammonia was wasted. Hence the general practice, until within a few years, of getting manure under ground as quickly as possible. But we have learned other facts about manure. When scattered over the surface in fall or winter, evaporation is very slight and very little ammonia is given off. Most manures are largely composed, so far as value is concerned, of mineral elements, lime, potash and phosphates, which cannot evaporate and must leach downward. Much even of the ammonia has been changed to nitric acid and, united with some base, has become a soluble nitrate. The manure applied on the surface of the soil in the fall is, before spring, brought directly to the roots of plants. Much of it indeed has been carried down so deeply that we need the long tap-roots of clover to bring it again to the surface. Under all the circumstances, putting manures on the surface, except on very steep side-hills, involves less loss than using them in any other way.

Much of the barnyard manure in spring is so coarse that for convenience in planting and cultivating hoed crops we plow it under. The roots of corn will reach it readily and with little loss. The following spring after partial decomposition, the ground is plowed and the manure again brought to the surface. But it is often found that the benefit of the manure is quite as great the second season as the first. Probably instead of leaving the course manure until spring, it would pay better to haul it out and spread it on the soil as made, during the winter. The soluble parts will be thoroughly incorporated with the soil, and the remainder may be turned under the furrow as before, to decay and become soluble.

An important advantage is gained in having some manure in close contact with the seed to give the plant a vigorous growth from the start. Manuring in the hill by hand is a tedious and expensive work; but even this will often pay. Hen manure thoroughly pulverized and diluted with three times its weight of gypsum, is excellent for either corn or potatoes. The object in mixing with gypsum is twofold: first, to weaken it so that the manure will not burn the sprouts of the seed, and, second, that the gypsum, or sulphate of lime, may absorb the ammonia of the hen droppings and become sulphate of ammonia, one of the most powerful stimulants of plant growth. Sulphate of ammonia is worth six cents a pound as plant food. Much of the effects of gypsum as a fertilizer are probably due to the fact that it always absorbs more or less ammonia from decaying matter in the soil and possibly, under some circumstances, from the atmosphere. I always advise the use of gypsum with nearly every kind of seed, for this reason.

The good effects of manure in contact with the seed often far exceed the presumable advantages from the manure itself. In other words, a little rich food at the beginning of the growth of a plant promotes its vigor and enables it to forage more vigorously in other parts of the soil. Concentrated manure also makes soluble some of the fertility locked-up in the soil which it touches. A spoonful of guano will make fertile from three to five times that amount of soil. Of course, to this extent manuring in the hill helps the plant to more rapidly exhaust the soil; but this is not really a disadvantage. All cropping is exhaustive and it is only objectionable when the product will not supply or purchase enough manure to keep the soil up to its original standard of richness.

The most frequent use of manures with the seed is in the application of commercial fertilizers by the drill. This is now the common practice with our best farmers, and its advantages are so numerous that it must become much more general. The benefits of manures, however applied, depend largely upon the after cultivation and thorough pulverization of the soil. I have rarely seen lumpy, cloddy land, however rich, produce a good crop; but I have much more frequently seen good crops on comparatively poor land well cultivated. We know that the elements of fertility must be present to make a crop; but on heavy land a great deal of cropping can be done if the soil is kept in good mechanical condition. The first sign of sterility in a clay soil, is when the vegetable matter wastes and the surface hardens and bakes.

Monroe Co., N. Y.

SAVING MANURE IN THE STABLE.

IN this city, V. B—a milk-man stables during the winter a herd of cows numbering, last winter 116. As he enlarged his barns during the summer, I presume the number will be greater this winter. All these cows are kept in one room. The stable is a basement with ground floor. It is cleaned only as suits Mr. V. B's convenience. When I visited it last winter, the accumulation was not less than one foot in depth over the whole floor. There was no stable odor. I wish to emphasize this point. The cows were remarkably clean. Not one in ten had any mark of manure on her quarters or about her udder. This condition of things was brought about by giving the cows plenty of straw bedding. Enough of the solid excrement was pitched under the forefeet and covered with straw, to cause the animals to stand level. The same gentlemen keeps his horses in ordinary or box-stalls in the same way, that is, he gives them plenty of bedding and removes their manure at his convenience.

In this way every particle of manure both *liquid* and *solid* is saved *under cover*. It is not only the cheapest but the best and cleanest way to keep cows or horses. I have kept a single cow in that way, and though I cleaned the stable in mid-winter only and again in spring, yet the cow was clean, the stable sweet and the milk clean and sweet. My horse stable—I keep a single horse—was cleaned July 1, and again Oct. 1, this summer, without in the interval causing any inconvenience from smell or heating. I have not cleaned my stable during the cooler months for some time, and during the heat of the past summer I tried very successfully the experiment of leaving the manure in it. I care for my stable with the help of a ten-year-old grandson, and never hear a word from my family about the smell of the stable being imparted to my clothing.

This plan gives the animals a soft, dry bed—a cushion to stand or rest on. The cows being clean, are not troubled with inflamed udders which are frequently caused by wet and consequent cold. When farming I spent much time, money and labor to save manure and to keep clean stables, clean cows and clean horses, and after having spent years in the endeavor, I find this the cheapest and simplest plan to accomplish the end. I commenced my reading of agricultural papers many years ago and from that time to this have read a great deal on the subject of saving manure. I have dug cisterns and drains; have dug out my barnyards so that they would hold water—and waded through them—have devised plans for pumping and delivering liquid manures; have cleaned stables and washed cows' bags; pitched filthy straw and cornstalks through a 15x15 inch hole in the stables, and I have lived to find it was worse than useless labor. I hope the coming generation will not be as foolish as I have been, but will show their sense by following Mr. V. B's plan. S. L. F.

Grand Rapids Mich.

LIME AND FARMERS' LIMEKILNS.

BY A WESTERN FARMER.

Lime as a Fertilizer.

THE value of manure is no longer a doubtful subject to a Western farmer. Farmers in the Western States, excepting possibly those who are now for the first time breaking up new prairie in Kansas, Nebraska, or Minnesota, are now compelled to look almost as closely to their manure supply as the most impoverished Eastern farmer. Among manures we must include what in contra-distinction are known as fertilizers, and lime is the most important although the most common of these. There is no other mineral that is more plentiful than lime. It is found almost everywhere in the West. From Western New York to the Missouri River, the underlying rock is almost everywhere limestone, and it is curiously true that the application of lime is equally effective on limestone land as upon clays and sandy loams where no lime is to be found.

There is no cheaper fertilizer than lime. When used upon soils rich in vegetable matter but which have been exhausted by continued cropping, it restores them at once through its

effect in rapidly decomposing the inert organic matter, and reducing it to soluble plant food. When used upon clay or sandy soils, of which potash rocks, such as mica, feldspar, or greenstone form a considerable portion, it is equally effective as it frees the potash from its combinations and renders it soluble. It has the same effect upon soils containing insoluble phosphoric acid, and releases it from its inert condition and makes it available as plant food to some extent. There is no other fertilizer to be procured by the farmer so cheaply as lime, that is at the same time so effective, or that can be so profitably used.

How to Use it.

A farmer may use 40 or 50 bushels per acre upon his fields every five years with great advantage; choosing the time of its application when he is preparing to seed down to grass or clover along with a wheat crop. Or, he may use 25 bushels per acre with benefit when he is plowing for a corn crop. He must, however, bear in mind that lime is, in fact, a key with which he opens the storehouse of the fertility of his soil, and if he goes therein and draws out all the stores and returns nothing, by and by the key will be turned only upon an empty receptacle; and he may as well then throw it away. For every application of lime in the rotation there should be one dressing of manure and one clover or grass sod plowed under; then a farm may be kept growing richer and richer, because by such management it will be only the surplus fertility which will be made available year after year, and only the enormous supplies of inert potash, phosphoric acid, and nitrogen, which any good soil contains, that will be gradually made soluble in advance of the requirements of the crops.

Limestone

when pure is carbonate of lime and is practically insoluble in water, and has no chemical action upon organic or inorganic matter. To become active in this way the lime must be made caustic or freed from its carbonic acid. This is done by burning it in kilns. The process of burning is very simple. When a farmer has a supply of limestone which he wishes to burn for his own use, he may make a pit something like those in which charcoal is burned; or he may make a temporary kiln; or construct a permanent kiln in a hill-side in which he may burn lime for himself and his neighbors.

Burning Limestone in a Pit.

A pit is made by laying down a floor of small logs or split timber in a hollow place. A layer of broken limestone is thrown upon this floor, the blocks being arranged as shown at fig. 1,

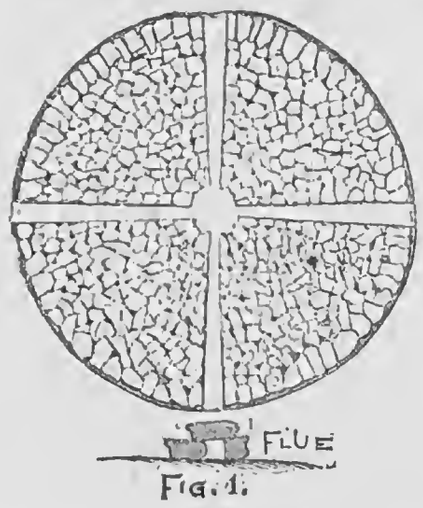

Fig. 1.

FOUNDATION FOR A LIME PIT.

so as to form flues by which the pit is set on fire and is ventilated during the burning. The pit is built up of alternate layers of wood or small coal and broken limestone, a sort of chimney having been left in the center. The outside is laid up carefully and when the whole is built up in a conical form, the outside is well plastered over with clay mud. The form of the pit is shown in section at fig. 2. Fire is then applied to the flues, which, as well as the chimney, should be filled with light-wood. The rest of the fuel may be rough wood, chips from choppings, or brushwood. The fire should be kept down and burning slowly by plastering up all the cracks, as these may form in the walls owing to the settling of the mass, or by thrusting into them sods or pieces of limestone and covering these with clay mud. When the fire is well started, the flues should be filled up with fresh wood, pushing this in as far as possible and then closing the mouths with stone and clay. In about 72 hours the burn will be complete, and when the whole mass is red-hot, it may be left to burn without further attention, excepting to punch it well together and fill up any openings by which air will enter so fresh as to cool the lime too soon. After three days, the lime will begin to cool and the pit may be opened. The unburned pieces of stone on the outside may be kept for another burning and the perfect lime may be then taken out for use.

It is now quick or caustic lime, and if the stone is pure and free from quartz rock it may be used for mason-work as well as for the field. To use it, it should be thrown in heaps of two or three bushels and kept exposed to the weather or to one or two showers of rain by which it will be slaked and fall to a fine,, dry powder; when it should be spread at once upon the land. One ton of limestone will yield a little over half a ton of burned lime, and one bushel of lime weighing 80 pounds, will absorb 26 pounds of water in slaking and will swell to more than twice its bulk. In the slaking, much heat is evolved, sufficient to ignite wood, so that the lime should not be thrown against fences or left in buildings which might thus be set on fire.

A Rough Kiln

may be built, in shape such as is shown in fig. 3, of "hard heads" or large cobble-stones, or so-called rocks picked from fields, but lime-stone should not be used, as it would not stand the fire, although for temporary use it will answer for three or four burnings when large blocks can be procured. The stones are laid up with lime and sand mortar, the inside of the kiln being made round and as smooth as possible. The kiln is filled with fuel and limestone as already described, but only from the top. It is therefore most convenient to build it near a bank, or else a stage must be made at the side of it. When the kiln is filled, the arch is closed up, excepting a fine hole to regulate the draft; when the lime is burned the arch is opened and the lime removed through it.

A Permanent Kiln

is built of the same general shape, as at fig. 3,

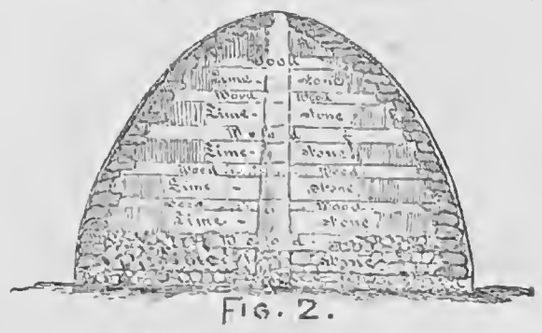

Fig. 2.

SECTON OF PIT SHOWING LAYERS OF FUEL AND STONE.

but more carefully, and is lined with good hard brick or with fire brick laid in fire-clay. Strong iron grate-bars are also built in over the arch and a fire-place is made in which fuel may be put to assist the burning. A kiln is best adapted for the use of fine slack coal as the main fuel, wood being used in the fire-place under the grate-bars. The bars are made so that they can be withdrawn when the lime is burned and so let the lime down into the arch from which it is removed. A permanent kiln is best made in a hill side so that the fuel and stone may be hauled up easily and dumped where they are wanted, from tip-carts. Lime may be burned in a pit for less than five cents a bushel when labor and material are paid for, and in permanent kilns the burning pays a good profit at ten cents a bushel.

The Herdsman.

THE JERSEY COW.

R. GOODMAN.

Jerseys and Guernseys.

The Channel Islands cattle were formerly known as Alderneys and Guernseys, but the exportation from the island of Alderney is so small each year and that from Jersey so large and the breeds of both islands are so similar in every respect, that the animals from the two last-named islands are classed in America as JERSEYS, and we know here of but two breeds imported from the Channel Islands, to wit: Jerseys and Guernseys.

These are distinct from each other in everything but quality and production of butter, and those not familiar with either race can easily distinguish the Jersey by its black nose and a white or light-colored band around the muzzle, the Guernsey having, almost invariably, a rich yellow or buff nose. This characteristic occasionally crops out on the Jersey, showing a Guernsey strain in some recent or remote generation, as a black nose marks an impure crossing in the Short-horn. To the breeder's eye the Guernsey is larger-boned than the Jersey, taller and stouter, coarser in the coat, wanting the symmetry and neatness of form of the other, and on the island where the

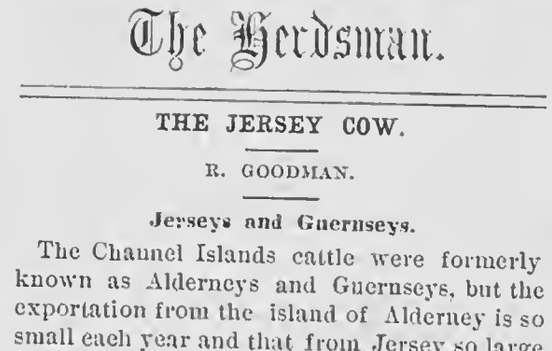

Fig. 3.

A LIME KILN.

latter are bred, the Guernsey is tabooed—not allowed to be imported within its limits or exhibited at the cattle-show fairs, and, in fact, there are but a dozen or so Guernseys on the Island of Jersey.

THE JERSEY'S HOME AND HER TREATMENT THERE.

This Island is one of the group of beautiful islands pertaining to the British Crown which lie near the shores of France in the bay formed by the coasts of Normandy and Brittany, consisting of Jersey, Alderney, Guernsey and Sark with their dependent islets. The largest, richest and most populous is Jersey, which lies about six leagues from the cost of France, being in form an irregular parallelogram eleven miles long and five and one-half miles wide. The climate is mild and temperate, without excessive heat in summer or severe cold in winter, while its surface presents to the eye a rich forest of fruit trees, gardens and little cultivated fields. When viewed more closely it is seen to be intersected with innumerable banks of earth covered with trees and verdant with the leaves of bushes and creeping ivy. These are the divisions of the numberless little fields and possessions of the inhabitants into which the whole country has been partitioned as an effect of the old Norman law of succession, reaching back over nine centuries and enforcing an equal division of land amongst the children of a family. Scarcely an estate is to be found on the whole island exceeding forty or fifty acres. Many vary from five to fifteen and the greater number fall near if not below the extent of the last-named area. All the practices of usual industry in the island are modified by this ancient law of succession and the land thus partitioned is cultivated in the manner of a garden, never lies fallow, is manured with the marine plants which grow in great abundance all over the rocky shores, and yields continued and bountiful crops.

The cow has become a great source of profit to these island farmers, as many as three thousand being annually sold from Jersey alone, and she is in an especial degree the subject of their care. She is penned or tethered on a narrow space and shifted to fresh spots of herbage several times in the day. In the winter nights she is warmly housed, and when about to calve, nourished and attended with great care. In addition to her herbages he is soiled with lucern, clover, carrots, parsnips, and the large Jersey cole, the leaves of which are stripped off as they grow; and it is a true saying that a Jerseyman will never treat his cow with neglect howsoever other animals may fare.

ORIGIN AND HISTORY OF THE JERSEY.

There have been many theories advanced concerning the origin of this breed of cattle, and a correspondent of the Kentucky Live Stock Record, allows his fancy to carry it back to the period when Jacob and Laban were breeders and the former "produced cattle of specific markings from the latter's herd," and he asserts the Jerseys are the descendants of a certain 'grizzled bull' in Jacob's herd. Unfortunately for this theory the ordinary editions of Sacred History speak of these early agriculturists as breeders of sheep and goats only in connection with the production of speckled and spotted animals, and do not mention the supposed ancestor of the Jerseys, the 'Grizzled Bull!' The more reliable theory is that, as the Jersey and Alderney cattle have a resemblance to certain breeds of Norway, Scandinavian cattle were introduced into the islands in the intercourse with the North which followed the subjugation of Normandy and its dependencies.

It is a singular fact that on this little island, not larger than Staten Island, New York, there is a marked difference between the cattle of the eastern and western districts, those of the side most exposed to the winds and saline moisture being small, fine-limbed and hardy: while those of the other side, which is more sheltered, finding a richer pasture, become larger in carcass and, some think, handsomer than the others. Col. Waring, editor of the American Jersey Herd Register, who visited the island for the second time last summer, noted another distinction—the northern and western parishes are giving themselves much more decidedly to the breeding for solid color, black switches, etc., than the southeastern parishes. And he says further that though breeding for fancy colors is condemned almost universally on the island as deteriorating the race of cattle, yet it has taken a strong hold of the majority of the large breeders, and will be practiced so long as the English are willing to pay the present high prices for fancy-colored animals. It is, perhaps, here that we shall be able to compete successfully with the islanders in breeding their especial stock, for we cannot hope to excel them in the dainty care bestowed upon their cattle, or in the little jocky preparations for market, for each beast is as tenderly treated as the Alderney of Miss Barker of Crauford, which, after being denuded of its hair by a fall into a lime pit, was clothed in gray flannel and watched over by all the town. But in breeding so much to fancy points, the real merits will be neglected, and by pursuing these, the breeder in the United States will win a superiority over all others in the production of profitable Jerseys. Indeed it is even claimed by recent visitors to the island that as good animals can now be procured here as there. The importations into the United States by the Fowlers and others command, on the average, higher prices than are obtained by breeders here, owing in part to the opportunity those importers have, by being on the ground, to select stock, in part to the application of the art of putting the animal in fine show condition, and in great part also to the idea prevalent as to all articles of use, ornament or instruction that anything coming from Europe is superior to a similar article of domestic production, or at least its foreign birth gives it a pronounced *éclat*.

THE JERSEYS AS BUTTER-COWS.

Nearly all the early treatises which allude to the Channel Islands cattle speak of the small Alderneys, their high price and their exclusive appropriation to the paddocks of gentlemen, their gentleness and delicacy of constitution, and it was said that being small in size, the milk they yielded is likewise small in quantity, though fully in proportion to their bulk in body; yet even in those days there were exceptional animals which gave their sixteen and twenty quarts of milk a day, and many which, taking several years together, exceeded in value the dairy cows of other breeds which gave more than double the quantity of milk at each milking, that of the Alderney being so rich in cream.

The Jerseys of the present day all over the United States are not small or ill-formed, but larger and much more symmetrical than was the average Jersey of twenty years since, the production of milk also being greater and the yield of butter surprising. In the latter respect the breeders of all other classes of stock, and even the ordinary farmers who have continued to swear by their native cows, are forced to admit that the Jerseys are superior to all others. In the Scientific Farmer, edited by Dr. Sturtevant, a noted Ayrshire breeder, it is stated editorially that "the evidence we have indicates that the Jersey cow is a larger milker than the native cow on an average" and instances are cited of nine to ten thousand pounds of milk from several Jersey heifers respectively in one year. The National Live Stock Journal for April, 1878, summed up the yield of 65 Jersey cows, which showed an average of 295 pounds of butter per year. Motley's Flora gave 511 pounds and 2 ounces in one year. Pansy (1019) 572 pounds in twelve months. A Philadelphia herd of 17 cows averaged 255 pounds each for the year 1876. Mr. Mackie's herd of 15 cows gave an average of 281 pounds on ordinary feed and in a breeding rather than a butter-making herd. In the annual report of the Secretary of Massachusetts State Board of Agriculture for 1876-7, is a portrait of the Jersey cow, Belle, owned by Mr. Elms of Scituate in that State, five years old, for which he has refused three thousand dollars. She made, in March, 19½ pounds of butter per week; in June, 16 pounds per week; in September, 14 pounds per week, and in December, ten months from calving, she was making one pound per day, being due to calve in two months. Five quarts of milk made a pound of butter all through the summer, and in December four quarts made a pound of butter.

It is not always the Jerseys of the largest yield of milk which make proportionately the greatest amount of butter. Those more moderate in quantity are apt to be richer in quality, and a cow giving twelve to fourteen quarts of milk a day is usually a more profitable butter-maker than one giving twenty quarts. We have in our herd Jerseys which produce, when flush, over forty pounds of milk a day, but we set a higher value on others which yield less but whose butter average for the year is greater.

CHARACTERISTICS OF THE JERSEY AS A BUTTER-COW.

The leading characteristics of the Jersey which make her so profitable as a dairy cow are:

First—Her qualities hereinbefore detailed as a milk and butter producer.

Second—Her persistency as a milker. The profit in cows is largely dependent on the continuous flow of milk for at least ten months, and one great reason for the non-success of ordinary dairying is, that the cows are dried off at or before eight months' milking, either because the work is troublesome in cold weather, or because a large calf is desired. The Jersey dries off with difficulty at the end of ten months, and produces a healthful progeny at the expiration of her period of gestation.

Third—The solidity and firmness of the butter made from her milk, which enable the dairy-man to produce as good an article in mid-summer as in spring or fall, the milk of ordinary cows differing greatly in these respects from that of the Jersey.

Fourth—Her ability to pick up a living upon as scanty pastures as any other cow, even one of the native breed, and make more profitable returns therefrom. But the converse of this statement is just as true and its practice more beneficial to cow and owners, for the Jersey will amply repay good and judicious feeding, either on pasture or in the barn. She bears crowding less than the Short-horn, and does her best in winter on early-cut hay with wheat middlings, a little Indian meal and roots.

Finally, the Jersey is as docile and beautiful as she is profitable, and either as a producer for

the butter dairy, or for the family, or as an ornament on the lawn or a pet in the barn-yard, she is unequaled.

A fair Jersey cow should not average during the ten months she is milked less than one pound of butter a day, and as Jersey butter brings everywhere a larger price than that from ordinary cows—say, ten to twenty cents a pound more—it is evident she is more profitable than the native animal for any butter dairy, and her calf will net the owner from $30 to $50.

The fine, gilt-edged butter-makers who obtain one dollar a pound for their production all the year round, mainly rely upon the Jersey as the cow for their dairies and in addition to the color, quality, quantity and flavor, find that Jersey butter bears transportation during the hot weather better than any other, one producer in my vicinity having for years sent his butter in tin-lined boxes a hundred and fifty miles all through the season, without the addition of any ice during the summer months.

THE JERSEY'S FUTURE HERE.

The observation of all discerning breeders who visit the Island of Jersey is that utility is there being sacrificed to vain show; that fancy points are usurping the place of dairy points; that the best butter cows are usually parti-colored, and that though the breeders of the island are themselves convinced that their course is destructive to the best interest of the island in the future, yet they are tempted by the large prices which the solid colors, black tongues and switches bring in the English and even in the American markets, and breed accordingly. Orders are sent for animals of a certain shade of color, without regard often to price and with no allusion to the udder marks, and it is not surprising that these orders are filled and a course of breeding established to suit the popular fancy, just as the silk weaver makes his patterns, not according to his own or any other's artistic taste, but in obedience to the demands of the man or woman milliner at Paris, for as Paris is France politically, so it is the World as to fashion. If we can keep clear of this lee shore and steer straight forward on the broad sea of large milk and butter production, combining therewith good carcass and form, the Jersey of the United States will yet take the lead the world over as the cow of the future. The increasing demand must be for dairymen's cows for utilitarian purposes, and no one can yet put a limit to the butter production of the Jersey, and she is yet to be developed by the breeders in this country beyond our most sanguine expectations, if we keep on the right course.

The Jerseys are now distributed all over the Union, and as a breed are numerically greater than any other except perhaps the Short-horn. They adapt themselves to any and all climates, becoming favorites in Maine at one extreme and Louisiana and Texas at the other, as well as in the regions between, and the demand is like that of Oliver, for 'more.' Every woman in the rural districts, whether she has her piano or sewing machine or not, must have her Jersey cow. At the regular agricultural exhibitions the Jerseys come forward as prominent competitors for premiums, and the interest taken in them is everywhere on the increase, and the farmers no longer sneer at their size or make unfavorable comparisons between them and the coarser animals to which alone they have until lately been accustomed.

The Jerseys have several Herd Books devoted to them in this country, but the Register of the American Jersey Cattle Club is the only one of authority among breeders generally, and a "registered" animal, in breeders' parlance, means one recorded in that Register, and the difference in price between a "registered" and an "unregistered" animal is usually about half in favor of the former.

Berkshire Co., Mass.

SALE OF FINE BLOODED CATTLE.

In Philadelphia, on the 16th inst; Alfred M. Herkness & Co, disposed of a large number of Jersey and Guernsey cattle and Hampshire Down rams, imported by Edward P. P. Fowler, of the Island of Jersey and Southampton, England. The attendance was large and the bidding at times quite spirited, but the prices realized were comparatively low. Among the collection of Jerseys offered and disposed of was Rosette 2d, two years old, which was purchased by J. E. Ridgway, of Philadelphia, for $360; Rebecca, one year old, bought by G. Volmer, of Germantown, for $235; Violet, two years old, by J. H. Cushing, of New York, for $215; Michot 2d, five years old, by Mrs. M. N. Rogers, of Philadelphia, for $200; Verichelez Pride, by Dundas Lippincott, of Philadelphia, for $250; Adeline, two years old, by J. E. Phillips, of Baltimore, Md., for $200; Magdalene, ten months old, by James Mooney, Philadelphia, for $205; Mabel, seven months old, by J. H. Cushing, of New York, for 195; Mignonne, nine months old, by J. E. Ridgway Philadelphia, for $390; Duchess, two years old by Alfred Baker, of Atlanta, Ga., $300; Patience, four years old, by William Barnett of Lionville, Pa., for $330; Cleopatra, three years old, by William R. Bullock, of Philadelphia, for $315, and Belle of Beaumont, two years old, for $160 to S. C. Kent, of West Grove, Pa. There were also the Jersey bulls Ameer, eighteen months old, and Beaconsfield, eleven months old; the former to James Young, of Middletown, Pa., for $215, and the latter for $225, to S. M. Burnham, of Connecticut.

Industrial Societies.

THE UTICA CONVENTIONS.

During the last week Utica, New York, has been the scene of a large gathering of dairymen, from all quarters of the country. The variety of subjects brought before them rendered this meeting probably the most important ever held in this country. The adoption of a constitution and by-laws for the proposed International Dairy Fair Association had to be considered and its officers to be elected. A meeting of dairymen was also held to consider the propriety and practicability of creating a test record for milch cows. Then the American Ayrshire breeders held their annual meeting at the same time. The American Dairymen's Association held its convention and the New York Central Farmers' Club had a meeting, so that the week was portentious with dairy doings.

To take these matters up in the order of their importance, we will first discuss the

INTERNATIONAL DAIRY FAIR ASSOCIATION.

At a meeting held at the American Institute at the close of the last fair, a committee was formed to draft a constitution and by-laws to be submitted to a convention to be held at Utica, New York, on the 14th day of January. Agreeably to this appointment, a large number of persons interested in the dairy or its products, met at the Butterfield Hotel and in committee went over the proposed constitution and by-laws, section by section, some parties contesting every step and thus foreshadowing the rumpus that was created when the committee's work came up before the regular convention for adoption. All the fiery eloquence, however, that was showered upon the meeting only evidenced by its heat the interest that all felt in so important an undertaking. Mr. Folsom and Prof. Arnold made some vigorous opposition to the constitution. The grounds of their claim were that the officers of dairy conventions in general should have been especially invited to be present at this meeting, and to further that purpose, it was proposed to adjourn until some time in the spring. But as no one felt like doing this work all over again for so small an object, the resolution was voted down by a large majority, and the convention proceeded to elect officers. It was early evident that there were but two candidates in the field, Mr. Francis D. Moulton and Mr. F. B. Thurber, and between them it was a very close race, first one leading and in the next ballot the other being ahead, neither being able to obtain a majority.

For the sake of harmony it was then agreed to let the one who obtained the greatest number of votes be elected. At the next ballot Mr. Thurber was the successful aspirant with a bare majority of four votes. His friends then came forward and urged upon the convention the propriety of electing Mr. Moulton first Vice-President by acclamation, which was done with great enthusiasm. Upon Mr. Moulton's final acceptance of the office which he at first refused, he pledged his best and most energetic efforts in behalf of the success of the fairs, and everybody felt relieved as there was great danger that the conflicting elements could not be amalgamated after the heat of the contest was over—and nothing but cheerfully working together would make the fairs successful. Now, however, we may look forward with every hope to a brilliant success for our International Dairy Fairs.

TEST RECORD FOR COWS.

Among the ideas that have been floating through the minds of the dairymen of this country and that, in fact, stands second in importance to no other, is the proposition to start a record of performances of dairy cows. There have been great trouble and diversity of opinions as to how the tests could be gotten up, but the necessity for it certainly exists in order to utilize the existing Herd Books that now only pledge the purity of blood, which blood may or may not be of any value in dairy cattle. If we can secure the records of cows' performances, then the existing Herd Books will be of very great value to us. To accomplish this end, a number of breeders representing all the breeds of thoroughbred cattle, met at the Butterfield Hotel, and discussed the feasibility of such designs as were proposed. I have not at present the time to fully outline even the propositions that were most favorably considered. It is of very great importance that we should hear from breeders generally through the agricultural press. Everybody seemed to be enthusiastically in favor of the proposed measure.

AYRSHIRE BREEDERS' MEETING.

This was held at Baggs's Hotel, for the purpose of electing their annual officers and making some changes in their by-laws and constitution. The officers elected were, for President, William Birnie, Springfield, Mass.; Vice-Presidents, Obediah Brown and Samuel Campbell; Executive Committee, T. M. Wells, Charles Sanford, Alonzo Libby, R. A. Boyer and A. R. Venable; Secretary, J. D. W. French; Treasurer, J. T. Brown. These officers were happily chosen from every part of the United States where Ayrshires exist to any measurable extent, and this mode of election is quite a contrast to that followed by some of the kindred associations that I know of. The matter of most importance before this meeting, was a proposition to cease registering the cattle that could not trace back their lineage to importations. The Secretary's arguments were to the effect that men were a little too liable to stretch the facts in making up such pedigrees, and that this imposed a fearful burden upon him. Such a proviso, however, is to be regretted, as we should foster home breeding as much as possible, while the fact of importation is of no real value whatever.

AMERICAN DAIRYMEN'S ASSOCIATION.

This organization also held its meeting at Utica during the week. The other matters were so much more absorbing that the speakers could hardly be held in their positions long enough to tell the empty benches what the agricultural colleges had failed to teach them. In fact, it was only after the adjournment of the convention of the International Dairy Fair Association that anyone took any interest in the addresses being delivered here. They were in no wise different from those of other years, and it was comical to hear each advocate state in glowing terms the rising beauties of his favorite breed of cattle, and as the speakers with different opinions followed each other in immediate rotation, the audience was completely bewildered. So, with the salt question: Professors, agents, dairymen, and dealers advocated this, that, or the other brand of salt with a decided leaning in point of numbers toward the peculiar prejudices of the secretary on this subject.

THE CENTRAL NEW YORK FARMERS' CLUB

also held a meeting at the Butterfield Hotel to elect the officers for the ensuing year. I did not get in in time to hear the usual addresses, and cannot therefore speak advisedly of them. The attendance was good, and the interest shown was flattering to the management.

A number of us belonging to the New York delegation took a sleigh ride out by the Unadilla Stock Association's grounds, and caught a glimpse of their beautiful herd of Holstein cattle and formed a pretty clear conception as to how beautiful that country would look in mid-summer, when something else than three feet of monotonous snow covers the face of the earth.

L. S. H.

A convention of sorghum growers will be held at St. Louis on February 5th, at which the advantages of the comparatively new Early Amber cane will be fully discussed.

Dairy Husbandry.

WHICH BREED FOR THE DAIRY.—No. 3.

L. S. HARDIN.

Points of Profit

Relation of food eaten with live-weight; a lesson from the trotting horse; average weight of milch cows of different breeds; proportion of milk and butter to live-weight; champion butter and milk breeds

In making up a table of the various good and bad points of cattle, we should not lose sight of the relative weight of each breed, nor will I by this admission subscribe to the common claim that large milkers always eat more than small ones. I think beyond doubt it is true as a general rule that large cows eat more than small cows, and probably in the exact ratio of their relative weights, and it is a great pity that our agricultural colleges cannot tell us what that ratio is. But when we come to the question of yield of milk, we are dealing with altogether another principle. Here we are met with the intricate principles of assimilation of food. A cow that will yield twenty-five pounds of milk a day, will probably consume two hundred pounds of food and water to accomplish it. Out of that two hundred pounds of material her powers of assimilation will decide the point whether she will make ten or fifty pounds of milk.

That I should make a difference between the powers of assimilation required to make bone and muscle, and the powers of assimilation required to make milk, looks a little as though I were imitating some of the professors in my theories. But I am certain my experience with cows demonstrates this to be a fact; whether or not the fact agrees with any theory is a matter of not so much moment.

There seems to be a parallel case in trotting horses. The horse that trots a mile in 2:20 will expend no more vital power than the horse that requires two minutes and thirty seconds to accomplish his mile, provided both are doing their best. The fastest horse will not, of necessity, eat more than the other. The cause of large animals eating more than small ones may lie in the fact that the former have a greater surface for evaporation, more extravagant lungs and other organs for throwing off waste material. But when it comes to producing a specific article, like milk or fat, the amount diverted to this purpose from the general waste, bears little or no relation to the original demand for food by the digestive organs. The question of what is the average weight of milch cattle is a difficult one. Probably no two breeders would set the same weights for the different breeds, and I am therefore all the more at liberty to pass my own judgment on their respective weights.

The time to test a cow's weight is while she is in full milk, as she is then in the best working order, without fat or fœtus to interfere more or less, as the latter always will, with her actual weight. I would put their respective weights as follows, being more anxious to get their relative than their actual average weights.

Jerseys	800 pounds.
Ayrshires	900 "
Natives	1,000 "
Short-horns	1,300 "
Holsteins	1,300 "

Prof. Arnold, in his work on American Dairying, puts the weight of Ayrshires at 1,000 pounds, Jerseys at 800 pounds, and Holsteins at 1,500 pounds. As it is hard to get the average of fat steers up to the last-mentioned weight, I am positive the Professor has made his estimate too high for any class of milch cattle.

Having offended our Short-horn and Jersey friends with the first table published on this subject, in order to be entirely impartial in the matter of giving offense, and to prevent having any friends at all, I will now give some additional figures that will, I fear, displease some of the other breeders. Having called attention to the fact that large cows eat more than small cows, and having given the relative weights of the different breeds with the respective yields of butter, I will now put them all together to see what proportions of butter and milk they yield to the one hundred pounds of live-weight. This table is made up from the two preceding tables.

BREED.	Lbs. milk.	Lbs. milk to butter.	Butter.	Av. weight of cows.	Butter to live-weight.	Milk to live-weight.
Ayrshire	5,469	25	218	900	30¾	607¾
Short-horn	6,312	25	252½	1,300	19 5-13	485
Jersey	5,625	22	281	800	35⅛	703
Native	7,550	25	302	1,000	30 1-5	755
Holstein	8,767	25	350	1,300	26 12-13	674

If this table is built upon sound principles, and taken from correct data—and I firmly believe it is, saving perhaps the Ayrshire yield which certainly looks too small—then it speaks volumes in favor of a more intelligent system of dairying. I have been laboring in season and, I suppose, out of season, to induce dairymen to stop the ruinous policy of carrying hundreds of pounds of superfluous flesh for many years on the frame of a milch cow only to make second-rate beef of her in the end. Does not this table, these solid figures, speak volumes in favor of eliminating with an unsparing hand those large-framed, indifferent milkers from the herd?

I notice that the Rural's very entertaining correspondent, Dr. Hoskins, gives us an article in favor of the Short-horn in the dairy; but with all his research, though his favorite breed has been in this country longer than any other, he has been able to find only one herd that can raise the butter yield to 261 pounds per head, which leaves the Short-horn still below the Jersey, Native and Holstein in the above table, and far below the correct figures of a profitable cow if she weighs the thirteen hundred pounds charged against her, and if she falls below this weight she has but poor claims to the honor of being called a Short-horn.

A gentleman writes to know what I mean by the word "actual" in my first table. That meant that the butter was actually made and not estimated at so many pounds of milk to the pound of butter, as with the other breeds where the owners only furnished me the milk yield.

In this table I have supplied figures for all the blanks and added the additional estimates of milk and butter yield to the one-hundred pounds of live-weight, which gives this:

Standard 35 lbs. butter to 100 lbs. live-weight.
" 755 " milk " " "

According to this the Jersey bears away the butter honors and the Native those for milk.

If anyone can find fault with these conclusions I hope he will do so, for I am only struggling to get right on this subject.

Arboricultural.

EVERY-DAY NOTES.

SAMUEL PARSONS.

WHY HAVE WE SO MANY ARBOR-VITÆS?

THE mere asking of such a question implies a superabundance of Arbor-vitæs. But I desire at once to explain my use of the term "so many" as decidedly relative. In other words, while we can hardly have too many useful and attractive trees properly distributed, yet we may employ too many of one kind, and especially of one kind which possesses undesirable qualities. There is, of course, a place on the lawn for every valuable ornamental tree, in spite of any particular defect, but whether we shall employ the more defective ones in relatively large quantities is another question. The Arbor-vitæ, or American Arbor-vitæ, for practically that is the only variety that comes under consideration, has been very widely distributed through the country in the form of hedges or single plants. Its special office, however, has been that of a hedge. When it first came into general vogue more than thirty-five years ago, the best judges thought it a great acquisition for the lawn, and recommended its use far and wide. Immense quantities of young plants could be obtained in the woods and pastures of Maine and elsewhere. It transplanted readily, grew well, and above all, could be clipped with ease into the formal (monstrous) shapes which seem so popular. Planting and other improvements in cemeteries grew to be the fashion, and what better plant could be used for hedges on the boundaries of cemetery lots than the American or more dwarf Siberian (American) Arbor-vitæ. Cemeteries have been greatly multiplied during the last twenty years, so that there has been great room for the employment of Arbor-vitæs. Their cheapness formed another attraction, and soon nearly every door-yard was graced with a hedge or, at least, two or three single specimens of Arbor-vitæ.

But let us consider whether this popularity was deserved. Except in June or early summer the Arbor-vitæ has a pale, peculiar green that is much less attractive than the green of many other evergreens. The shape is decidedly formal, possesssing little grace or elegance, but is, nevertheless, attractive when used in moderation or grouped with other evergreens. Neither is the beauty of the Abor-vitæ long-lived, especially if the tree is left unpruned. It becomes naked at the base, bulges out and splits badly. Even its most popular quality, that of clipping well, soon stunts it and produces surfaces devoid of foliage. There are a half-a-dozen evergreens that surpass it for ornamental purposes, such as White and Norway Spruces, Hemlocks, Retinosporas and some Pines and Silver Firs. Yet one objection that has been made against it, lack of hardiness, is not a fair one, since it does as well in winter as most evergreens. The way in which the growth of Arbor-vitæs has been discontinued since the heavy freeze a few winters ago, is due to as ill-judged a procedure as was the former mania for its universal employment. It must be explained also that the discontinuance of hedges on cemetery lots has done much to restrain the general use of Arbor-vitæs. Indeed, now that we are employing a much larger variety of evergreens for lawn-planting, such excessive use of one kind of tree will scarcely happen again.

THE VALUE OF EVERGREENS IN WINTER.

Walking out to-day in the bitter cold of a winter's morning, with the mercury at zero, thoughts in accord with the weather came to my mind. These thoughts naturally dwelt at first on the intensity of the cold, bleak wind, but as I passed suddenly into the lee of a grove of Norway Spruces, my mind, sympathizing with my physical condition, turned to the value of evergreens in winter. Anything that could afford such delightful shelter in winter deserves mention in the highest terms. During the temporary luxury of walking in the lee of these trees, I made up my mind, as I had never done before, that every one should plant evergreens to the north and west of his dwelling. I fully realized at this moment their supreme value as wind-breaks, and wondered exceedingly why people did not always attend to this matter. Deciduous trees may be, and are, valuable and delightful on other parts of the lawn, but nothing can take the place of evergreens for the north and west. True, few sorts of evergreens are suitable for wind-breaks. But if Pines and Spruces are disposed in an irregular belt or semi-circle, planted somewhat alternate-wise about the northwest corner, the borders, front and rear, might be varied by outposts of choicer specimens. Thus situated, fine evergreens could develop properly and exhibit their charms in their very best array.

HIBISCUS COCCINEUS.

Again, in the retired nook that would be left in the angle behind the wind-break proper, choice evergreens and other plants of low growth could be mingled with natural bits of rock-work, and the whole reached from the lawn by obscuring and winding paths. A varied and pleasing effect could in this way be given a wind-break, which otherwise would lose its attraction with the lapse of time. Large evergreens suited for shelter, Pines and Spruces, seldom retain for many years an appearance that is attractive close at hand. Need I exhort everyone to the practice of combining the useful and the ornamental in lawn-planting as in other operations? Hardly: everybody must already know the desirability of doing so. But perhaps everybody does not realize in actual practice how exceedingly ornamental a useful thing may be made.

A SCHOOL OF FORESTRY.

BY FRONTIER.

A FRIEND who resides far out on the plains, urges with much earnestness the establishment of a school of forestry, or experimental station, at some central point in the vast region embracing Nebraska, Kansas, the Indian Territory and Texas. From long experience he has been forced to believe that this is one of the great wants of the plains. There are some good reasons for his conclusion. It must be conceded by every intelligent observer that the possibilities of forest culture will determine more than any other available branch of human industry, the future wealth and national importance of this vast central region, 15,00 miles long and 500 miles wide—a country of unsurpassed natural fertility, and larger than the whole of the German Empire and France combined. The great want of this entire region is trees, and nothing can add more to its available wealth than a system of forestry adapted to the plains. As this country is rapidly filling up with a hardy population, the tree-planting interest is becoming daily more important. If the claims of forestry deserved the consideration of Congress in any way last year, in view of the rapidly changing condition of the great plains the demand for attention is vastly greater to-day.

While the subject of forestry is of national importance—a fact recognized by the appointment of a national Commission upon it, and the publication of an extended report on the subject—yet with respect to the plains it demands special consideration. In a large area of our country forestry is practical only with respect to conservation; but here the location and production of forests form the all-important question. The more intelligent nations of the Old World have for many years been at work in this direction with an energy and wisdom that should challenge our emulation. In view of all the surroundings, this work can be no more important in Germany, Belgium, or France than in this vast region which occupies the very center of our national domain. If the governments of the Old World are acting wisely in making liberal provision in this direction, then surely we are making a great mistake in neglecting to foster this interest. The want nationally is virtually admitted by the appointment of something like a Commission of forestry.

The most important question, then, is, how shall this want be supplied? It should be remembered that as far as the great plains are concerned, a system of forestry which has grown up in the damp, cold climate of Europe will be of little avail here. Our system of forestry, if we ever have one, will not only be peculiar to, but a creation of, the plains, and its success will depend upon plainsmen who have studied and learned to overcome our peculiar climatic conditions. It may be well to send Commissioners of forestry to Europe, but would it not be more practical to expend money in learning here at home the real conditions essential to successful forest culture. We do not want so much to know what can be or has been done in Europe as what can be done on the plains. The sending of men to Europe will not help us. If there is anything to be done, it should be done here. Our business is with our own peculiar climate and soil. We do not need to expend much time in studying the forestry of Europe, but we do want the means to study forestry here at home. And we would say to our Government, instead of expending thousands in looking after European processes, give us somewhere on the plains an experimental station, or school of forestry. Let it be established upon an intelligent and ample basis. Let it occupy some central point in thi s vast region, where the peculiar climatic conditions of the plains can be carefully studied, and the difficulties in the way of forest culture successfully met. Or, better still, would it not be possible to connect with our military posts a series of experimental forest stations, the whole being under an intelligent superintendence. Or, if neither of these plans can be made available, will not some persons of ample means, who have the future interests of this great country at heart, take this work in hand and see that something is done? Is there not some one who will do for the development of American foresty what J. B. Lawes has done for English husbandry?

Manhattan, Kansas.

Floricultural.

HIBISCUS COCCINEUS.

ONE of the most beautiful species of Hibiscus, and one which has not as yet received the attention of florists and amateur cultivators of flowers to the extent it merits, is Hibiscus coccineus, a representation of which is given in the accompanying engraving. It is a perennial herb, and grows wild from Carolina southward in marshes and on low, rich land, where it attains a hight of about six feet. The leaves are palmately veined and deeply parted into five lanceolate, acuminate lobes. In its native home it bears in July and August a profusion of bright red flowers that often measure six inches or more across, but in this latitude neither blooms so early, nor are the flowers so large. For the past three years this Hibiscus has been cultivated at the RURAL Grounds, where it has been kept in plant-house during winter and transferred to the open ground in May; but lacking the hot sun and humid atmosphere of its native habitat, it did not bloom until it was moved to the green-house in the fall, though there can be no doubt that it might bloom out-of-doors in this latitude, if forced for some time in the green-house before setting it out.

Being a very ornamental plant, with graceful foliage and large, showy flowers, and requiring no special care but such as can be tendered in any ordinary green-house, it is well worth cultivating, and deserves a place in every moderately-sized collection of plants.

Our engraving of the flower is somewhat and of the leaf considerably smaller than life. It was sketched in part from a dry specimen which bloomed with us the past season, and in part from a colored plate in Mr. Meehan's series to which references have repeatedly been made.

We chose to present the engraving, not only for the beautiful plant it represents, but because by its aid we can give our readers a better idea of the the Rose Hibiscus (H. Moscheutos) seeds of which are offered in the RURAL Seed Distribution (see Nov. 9). The flowers of this are larger, the petals broader and more imbricated and the color is generally rose, (sometimes white) instead of crimson. The leaves too though coarsely toothed, are but obscurely lobed, while those of Coccineus are, as seen, deeply parted. Both grow naturally in swampy places and both will thrive in high, dry soil. We are in hopes that the seeds we send out may lead to that cultivation which it is reasonable to suppose from analogy, it alone needs to induce the departure from the original which we call "improvements."

Entomological.

THE WOOLY APHIS OF THE APPLE-TREE.

(*Schizoneura lanigera. Hausm.*)

PROFESSOR CYRUS THOMAS.

I SEND the following notes on the above-named insect, to be added to what is said by Mr. Mann in the RURAL for Dec. 28.

As stated by Mr. Mann, the species was named by Hausmann in 1801 as infesting all apple trees in Germany. Serville and Amyot assert that it was unknown in Europe previous to 1787, at which time it was first observed in England, having been, as it was supposed, imported from North America. Tougard (*Ann. Soc. d'Hort. de Paris*) asserts that it was unknown in Belgium previous to 1829. The first-named authors also state that it was not observed in France until 1812. Harris, relying upon the authority of Salisbury ("Hints on Orchards"), declares that it was unknown to French gardeners for a long time previous to the date of its supposed importation into England. If it was imported into England in 1787, it did not reach France and Belgium until 1812, yet we find it in Germany in 1781, and that without any hint as to its recent importation. Serville and Amyot appear to have overlooked Hausmann's statements, although they must have had before them Vol. 1. of *Illiger's Magazine*, in which they were found. I may also add that M. Eudes Deslongchamps, in a prize essay read before the Agricultural Society of Caen in 1830, and M. Blot in a paper of the same date, maintained that it was not introduced from America, but was indigenous to Europe; that occasionally, under favorable circumstances, it was greatly multiplied in certain localities, and then for a time would disappear, and hence the idea of importation. The name "American Blight," given to it in England, indicates, on the contrary, the popular belief in that country of its American origin: but such popular names are about as often wrong as right. Prof. Riley in his third report, asserts, upon what authority I am unable to say, that it is conceded on almost all sides that it was imported from America into Europe.

Its habits, all the facts that can be ascertained in reference to its history in Europe, the discovery by Messrs. Walsh and Riley of its identity with the Apple-root Louse, are sufficient, in my opinion, to render it highly probable at least, that Harris was correct in supposing it to be an importation from Europe into America.

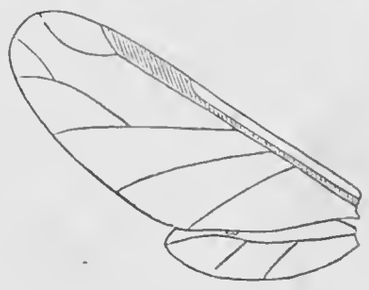
The generally accepted opinion in reference to the manner and place of depositing its eggs, as stated by Mr. Mann who follows Harris, is, I think, theoretical. He speaks of the winged females of the fall brood flying from tree to tree, depositing their eggs in the crotches of the branches, chinks of the bark, etc. I know not what personal observations he has made, but it is certain that Harris copied from Hausmann and Knapp his statement in reference to this matter; also that these two authors were not so fortunate as to discover a single winged specimen; in fact, they were of the opinion they never acquired wings, and Harris appears to have coincided with this opinion. It is also certainly true, as demonstrated by Walsh and Riley, that the winged specimens described by Dr. Fitch did not belong even to the same genus as the Wooly Aphis, but to Pemphigus.

While it is true that winged, oviparous individuals occur among the Chermesinæ and allied genera, the oviparous females of Aphidinæ are always apterous, and the same is probably true of the Schizoneurinæ; in fact, Kattenback believed the species of this group were always viviparous, but this is now known to be a mistake. Koch, in his admirble work on the Plant-lice, fails to notice this species, but speaks of the "Altmutter" (colony founders), of one species of this genus (*Schizoneura*) as being winged, though in most cases they are described as apterous. But this does not prove they are "oviparous," as in a large majority of cases the winged Aphides which found colonies are "viviparous."

While it is very common for the Aphidinæ or higher types of the family, especially those which feed on the leaves, to hibernate in the egg state; on the contrary it is very common for those of the lower types, which are oviparous, to winter over as larvæ, especially those which infest the roots as well as other parts of the plant.

While I cannot say that the Wooly Aphis of the apple tree does never hibernate in the egg state, I do know from personal observation that it does (and as far as I have observed only), winter over in the larva, or preparatory state. In January, 1877, after one of the coldest spells we had experienced for several years, I found them, while the snow was yet on the ground in considerable numbers on the trunk of an apple tree in my yard. And now, while writing this communication (Dec. 31, 1878), while the snow is still several inches deep and after most severe cold, I find them on the trunk of an apple tree, torpid, it is true, but reviving and moving about soon after being brought into a warm room.

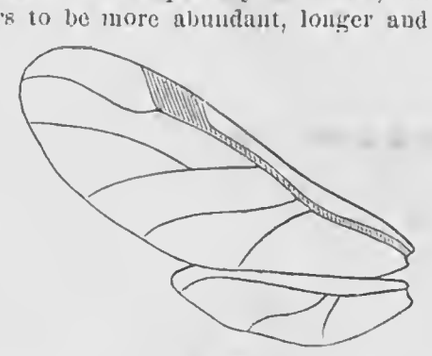
Another significant fact to which my attention is now called for the first time is, that they appear scattered over the trunk in little colonies in such fissures and chinks as they could find. In these colonies the few (from one to three or four), apparently full-grown individuals, which are thickly covered with cotton, are all dead, the larvæ alone remaining alive. These full-grown individuals are all wingless. Were they the founders of the colonies? Or were they deposited by winged females? I have failed entirely to find any



No. 1.

eggs, although I have examined closely for them. I find minute yellowish-white globules in the cottony material, but these little vesicles are not eggs, they are fæcal matter discharged from the anal aperture. The same thing is common with the Elm-leaf Aphis (*Schizoneura ulmi*), a species which, on account of the annual decay of its habitat, most probably hibernates in the egg form, but the reason for this is wanting in the case of the Wooly Aphis of the apple tree. Taking all these facts into serious consideration, I am disposed to seriously doubt the correctness of the statement Harris has copied from Hausmann and Knapp concerning this matter.

Most orchardists are aware that the work of these insects can generally be detected even after they have disappeared. They usually cause the surface of the spot they infest (on the trunk or branches) to become granulated and roughened. If present, they are easily recognized by the bluish-white, cottony substance they secrete from their bodies. At certain times, and especially in winter, this appears to be more abundant, longer and of a

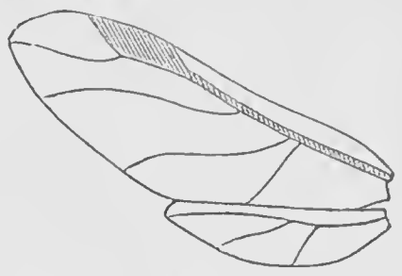


No. 2.

purer white than at other times. When they locate on the trunk or branches, so far as my observations extend, they usually select as a starting point some fissure, cut, break or otherwise injured spot in the bark; or, if these cannot be found, the wrinkles about the axils of the larger branches. In 1876 I noticed, during the summer, little scattered colonies even on the smaller limbs and twigs. If a tree is neglected and allowed to send up sprouts from the base of the trunk, the point of junction at or below the surface will be found a favorite resort for these insects.

REMEDIES.

For those on the trunk and branches, Mr. Mann has already mentioned the chief topical remedies. Kerosene, if carefully and properly applied, will probably be as effectual as anything else that can be used. Blot was of the opinion that topical applications were of comparatively little use, probably because the trunk continues to be supplied from the root colonies. His reliance was chiefly on preventive measures, and to this end he recommends the following culture: Avoid giving to the nursery, where the young trees are, more shade than absolutely necessary; avoid placing the trees in too flat or humid ground; give to both the nursery and orchard all the ventilation possible, so that they may be thoroughly aired, and keep the heads of the trees open, so as to favor the circulation of air and the drying of the soil; use the plow frequently, and do not permit rubbish or twigs to remain under the trees; surround each tree with soot or tobacco and fine sand.



No. 3.

For the destruction of the root-lice Dr. Fitch suggests clearing away the earth from the roots, as far as it can conveniently be done, then pour strong soap-suds upon them in sufficient quantity to penetrate and saturate the crevices in the excrescences. The soil taken out should be removed and other soil substituted; or, if returned, ashes should be freely mixed with it. I think it would be well in any case to substitute light and very sandy loam mixed with ashes or lime. Another method which was long ago practiced by French horticulturists, and strongly recommended by Blot in his celebrated essay on this insect, and which has also been recommended in this country by Harris, Walsh and Riley, is to drench the roots with hot water, applying it in sufficient quantities to penetrate to all parts of the roots which have been attacked. So far as I can ascertain, this species appears to infest the trunk and branches more abundantly in the northern sections, retiring more and more to the roots as we move southward.

I send herewith cuts of three principal forms of wing venation found in plant-lice. In No. 1, the third oblique vein is twice forked, which is the form found in most of the leaf-inhabiting species, as the rose, cabbage and apple plant-lice. No. 2 has the third vein but once forked; this is the form seen in the Wooly Aphis of the apple tree. No. 3 has the third vein simple, unforked and is seen in the genus Pemphigus or gall-making species.

Carbondale, Ills.

The Poultry Yard.

THE GAPES IN CHICKENS.

GEN. W. H. NOBLE, BRIDGEPORT, CONN.

Advent of the Pest.

I HAVE always dreaded a visit of the gapes to my poultry. Till a few years since it had never been known in this neighborhood. But in an evil hour, I was tempted to cross a large white hen with my fowls of that pet color. She came from a farm where about one-third of the chickens yearly died with the gapes. Often whole early broods were swept away. I had often seen the poor wee things gasping for breath, sickly-looking and stunted. They stood around in torment when they should have been on a joyful hunt after worms and grubs. Those which lived through the virulent season of the pest were greatly behind the size and vigor to which they were entitled. I believe in the doctrine of the survival of the fittest. But I don't think the fittest survive in any better shape for running the gauntlet of disease and hardship for dear life. Now I did not suspect that those contraband gapes would have hid somewhere in the substance or apparel of that old hen, and traveled with her to torment me. I don't know of any theory about the pest which furnishes it with a lodging or resting-place in the precincts of a full-grown fowl. Yet as it came and set down a big death list in my flock with the advent of this white hen, I cannot but think that the seed of the gapes took passage with her, like rats on a ship. At any rate, the next spring lots of my nice chicks gave up life under the painful ail.

Untrustworthy Nostrums and Safe Remedies.

I tried to conquer the trouble by fishing the worms from their throats with hair snares and feathers; but I am not handy at such work. The business, too, is tedious, and one which can not be safely deputed to Patrick. If this is done, the gape worms and the chicks will be buried in the same graves. In throat swabs of kerosene or turpentine, or in anti-vermin cures mixed in food, I never put much faith. The first might kill the worms, but would be pretty sure to kill the chicks, too. As to the food mixture, I never could see exactly how a cure taken into the stomach, would kill a worm in the windpipe. The remedy would have such a round-about road to get at the gape cause that I fear it would tire out on the journey.

Then I bethought me of the insect-smiters, lime, sulphur and carbolic acid. I slaked a barrelful of lime-wash to about the thickness of paint. Into this I stirred from ten to twelve pounds of sulphur-flour. Into each pailful used, I mixed about a tablespoonful of carbolic acid. With this on a broom or brush I sloshed over every part of my hennery, roosts, floor and walls, as well as every chicken coop, outside and in. Particularly over the floors of the latter a heavy coating was flushed. In the chicken coops this regimen was renewed again and again, especially with each new brood in the breeding season. The work is done very quickly. When Patrick finds out that he has not a job of delicate and artistic whitewashing on hand, he soon learns to despise economy of materials. The result is that the gapes have left. I have not lost a chick from it in more than two years; nor have I seen a symptom of its life in my broods.

I say, therefore, here is a remedy that suits all phases and years of hen life. It's just as good for the old as the young; for the mites of spider lice and for those bigger crawlers that so torment our fowls, as for killing throat worms. I have no doubt that other methods of defence and cure, from time to time put forward in the RURAL and kindred journals, have great and perhaps equal merit. The fumigation of a brood with tobacco or sulphur smoke in close quarters or coops; the thorough saturation of the dwelling and premises of our feathered pets with the dust of hellebore or Persian insect powder, well diluted with fine dry ashes of wood or coal, or with flour of sulphur, all do a blessed work for our poultry. These fumes and dust, breathed and blown into the throat and lungs and into the plumage of our birds, strike the vermin where they live, and stick to their hides to kill.

Lots of Sure Cures.

I think we should criticise and charily adopt all cures put forward for ails, which do not hint some trial or reason for their use. We know that everything in my mixture is a terror to insect tribes. But virtues are claimed for many things which are mere whim-whams and senseless fancies. No untried remedy put forward for any ail, which does not logically sanction a hope of cure, deserves our tests.

I am often amused at the thousand and one remedies put out for the ails of animals, trees or fruit. Lots of them are mere enthusings of those who are always ready with a cure. The curculio has had ruin threatened to his waste and life over and over again; but the rascal still lives and hurts. A good specimen of these random remedies was given by an able lawyer and senator to a professional friend, as sure to keep his plums from curculio ravages. It was to bore in the plum-tree trunk a hole large enough to admit a roll of sulphur, and after placing it there, to plug the opening; "then the sap currents would absorb the sulphur and kill the insect." This is a good deal worse than doctoring the stomach for a worm in the windpipe. But it is about as logical as that funny medley which Mark Twain recorded as the kind suggestions of friends to cure his cold.

Know About What You Prescribe.

Therefore, let no one put out in word or print a cure for ails in man, beast or tree, unless he can tell us of a trial of it, or give us some logical reason for hoping good therefrom. The old extinct Globe newspaper, the organ of "Old Hickory," flaunted at its head the sensible motto, "The world is governed too much." Some medical books or papers might well set up a paraphrase of it, "The world is doctored too much."

FEEDING HENS FOR EGGS IN WINTER.

IF a man has a comfortable place in which to keep his hens, he can keep them laying through the winter, if he chooses to give them the necessary care and attention in the preparation and variety of food. As to variety of food, though either corn or buckwheat, as well as other sorts of grain, are excellent feed for poultry, still neither corn nor buckwheat alone, meets the requirements for egg production, but either or both of them with the addition of other food of different kinds, to make a variety suited to the birds' wants, will answer the purpose, and produce a supply of eggs which will well repay the expense and labor involved. I have had excellent results from feeding mainly with buckwheat, giving daily, in addition, some kind of cooked food warm, as, for instance, a pudding of corn-meal, or some small potatoes baked, and occasionally seasoning the mess well with cayenne pepper.

An occasional feeding of scraps of meat or something of that kind, is also necessary in the winter when the fowls are confined to the house and there are no insects or anything of that nature which they can procure—at any rate if this is not a necessity it will be found a very beneficial addition to their diet. A supply of bones or oyster shells burned and powdered, or in some other way rendered fine; or some other material containing lime for the formation of the shells, should always be kept within reach of the hens. They should also have access to the earth in some manner, or a quantity of gravel should be kept in the poultry house, as it is necessary to the health of fowls that they be able to obtain something of this nature to aid in the process of digestion.

Perhaps it may be unnecessary for me to say anything of the necessity of a supply of water always being accessible to them, but I have seen fowls kept where they could obtain no water in the winter except by eating snow, and though they may live through that bleak season despite such treatment, still no one who treats hens with such neglect deserves, or will receive, anything from them during the winter months to pay for the food consumed by them. Now, let any who want a supply of eggs this winter, follow the mode of treatment here suggested, and I think they will be satisfied with the results.

E. J. B.

A GOOD EXAMPLE TO FOLLOW.

A CORRESPONDENT in Ottawa, Illinois, sends us an interesting account of a Poultry and Dog Show, which lately entertained that town through the efforts of the La Salle County Poultry Association. There was a liberal list of premiums for all kinds of poultry and

canine excellence, and all varieties were well represented, the entries including some fine specimens of water fowls as well as pure-bred birds. We are glad to hear that the exhibition was a financial success, as such displays are always sure to be in all enterprising towns surrounded by wide-awake farmers, if only the undertaking is judiciously managed. What adds to the pleasure of this result, at the same time that it shows a growing tendency to a very desirable united action among the agricultural community, is that it was the first venture of the kind in that neighborhood. As a natural consequence of the financial and pleasurable success of the undertaking, the managers have come to the wise determination of getting up similar meetings every year in future. By noticing the shortcomings and openings for improvement in each year's display, such exhibitions may be made both highly successful pecuniarily, and sources of pleasure and profit to the whole neighborhood.

Everywhere.

NOTES FROM KENTUCKY.

It has snowed here more or less twenty-two days out of the last forty. The snow is now fourteen inches deep, giving us better sleighing than has ever before been known in this vicinity. The highest temperature during the past four weeks was 49°, the lowest 20°, average 28°. Our out-door stock, however, is doing much better than when it rains, snows, freezes and thaws in such quick succession as it frequently does in this latitude.

Stock hogs and cattle are abundant at 2½c per pound; wheat is worth 85 to 90c.; corn, 35c.; potatoes, 40 to 50c. per bushel. We have had more failures during the past year than ever before. Farms that, five years ago, sold readily for $50 to $100 per acre, are now offered for from $20 to $40 per acre—good, well-improved, river-bottom farms. It does seem to me that the bottom is reached at last, unless it has fallen out entirely. The fear of the latter calamity deters, I presume, many from taking advantage of the present crash in real estate.

The potato crop is one of the most important here, and it may be interesting to note the varieties grown and the yield per acre, with our ordinary field-culture, generally on clover-sod, without artificial fertilizers, and with but little barn-yard manure.

VARIETIES OF POTATOES GROWN HERE.

Scotch Noble, large, round, deep-eyed, late, averaging, the past season, about fifty barrels per acre, which is equivalent to seventy-five in favorable seasons. This is the successor of the Shaker Russet, and closely resembles it.

Peerless, too well-known to require a description. With us, it sets more than it can mature, averaging, for the last five years, about forty barrels per acre, although I have grown this sort at the rate of three hundred barrels (sic) per acre. (!)

Superior, a new variety of excellent quality and fine appearance, that yielded with me the past season at the rate of one hundred and forty barrels per acre, notwithstanding the beetles and blight.

The Peach Blow was a total failure this season with us, and is losing caste as well as the Early Rose and King of Earlies.

Early Vermont, Compton's Surprise, Brownwell's Beauty, and Snow-flake have been discarded.

Beauty of Hebron will be tried here for the first time next season. Coming, as it does, from our esteemed friend, the Rural New-Yorker, we expect it to be *the coming potato*.

S. E. H.

Milton, Ky., Jan. 11, 1879.

RURAL SPECIAL REPORTS.

Virginia, Rivanna Albermarle Co., Jan. 6th, 1879.—On account of low prices of crops, the price of labor has been reduced for 1879 about 15 or 20 per cent. This year No. 1 men hire for $80 by the year, and for $8 per month. Wheat in this section of Va. was a failure, averaging not more than five bushels for one sown in this county. I sowed 169½ bushels of Fultz wheat, and made last year not quite 1,000 bushels. The tobacco crop was an average one in quality; but only about half a crop was planted. From eight acres I shall make about six thousand pounds. The hay crop is excellent. From forty acres of timothy meadow, I made over 120 tons. The corn crop also was splendid. I housed eighty-seven and a half bushels of corn from a measured acre of land last year, and from another acre, 600 yards distant from the first, eighty-five and a half bushels; that is, 171 bushels in the ear. From 48 acres, Rivanna River low grounds, I made over 7,000 bushels of ears of corn, not including what was destroyed by crows, coons and musk-rats, or what was stolen—the latter amounting to probably 300 bushels. Albermarle beats the world for corn. My neighbors all laughed at my crop while growing, but the laugh was turned when we gathered the corn, no neighbor making over 71 bushels per acre. Mine was a little too thick for a *maximum* crop, but theirs was too thin. In a letter from a friend in Hudson, N. Y., he says, "Your corn yielded rather more to the acre than any of my neighbors or myself can boast, and I really think it would give our county a pretty severe strain to match it." The former owner of Rivanna made, one year, 137½ bushels of shelled corn from an acre of this land.

Prices of produce in Albermarle are: Wheat, $1; corn, 40c.; oats, 30c.; timothy hay, 50c.; pork, 4½c.; best beef cattle, 3c. gross; Irish potatoes, 75c.; flour, $4.50, extra; butter, 20c.; apples, $2.50 per barrel; lands from $2 to $200 per acre, according to improvements and proximity to Charlottesville and railroads.

R. H. R.

Kan., Parsons, Labette Co., Jan. 9, 1879.—It is precisely four weeks since "The Storm" set in, and for once, at least, the audacious man, even, has not seen the like. On the 24th of Nov. last I was plowing, and it was so warm I pulled off my coat, and this not being enough, I had to pull off my vest also. On the 12th of Dec. a severe storm drove across the northwest, and while it brought snow to the lower Missouri, it brought rain here; but this froze as it touched the earth, and every blade of grass and every tiny twig became enveloped with four times its own diameter of ice, which either broke down the trees or bent them to the ground. The older peach and plum trees were badly riven. The young ones escaped.

The temperature for Dec. here was 19 7-100°. The temperature on the six days out of the first nine in this month, was 8° below zero; on the remaining three the thermometer registered zero to 10° above.

Arkansas, Van Buren, Crawford Co.—This county borders upon the Indian Territory, and at the end of our railroad communication, terminates in the valley of the Arkansas River. The soil is good and the climate, as a rule, delightful. Cotton is our staple crop, and almost for the first time, the yield last season was unfavorable, owing to an early frost. Corn, like all other cereals, does splendidly here. Stock can winter without artificial protection. Lands are cheap, and the country more healthful than the States of Illinois or Indiana. Where weeds are permitted to grow unchecked, we can beat the world. Pumpkins weighing from 50 to 100 pounds apiece, are common. Fruits are abundant, and we can grow two crops of Irish potatoes in one season.

L. C. W.

Va., Ashland, Hanover Co., Jan. 10.—The present is a season of greater financial pressure hereabouts than I have ever seen. The people are everywhere in debt, while the appreciation of money and the consequent depreciation in the prices of all farm products, leave many farmers without hope of being able to clear off the incumbrances on their lands. Agricultural prosperity must here be rebuilt on a foundation of ruins. If farmers were only out of debt they might do very well, but loaded down with mortgages and taxes, many of them will, I fear, have either to abandon their places entirely or to rent or sell a large part of their farms.

A. H. P.

Kansas, Pawnee Co., Jan. 8.—Weather very cold here. Sunny Kansas has put on her winter robes. Snow is about eight inches deep. Fall wheat, which is the chief crop here, is looking well and bids fair for another good crop. The last season's yield was about twenty-three bushels per acre all over the county. All other farm crops were good. Farmers should certainly be satisfied where they get their land for the living on it, as most of them here do, and don't have to pay a share of their products for fertilizers, as the Eastern farmers do. In fact, our soil would make a good fertilizer for the land in the old Eastern States. The Government land, however, is all taken in this county.

F. H. D.

Kansas, La Cynge, Jan. 2.—The weather in Kansas is unusually severe. On the night of the 13th and day of the 14th about twenty inches of snow fell—the largest fall of snow known in this climate. Since then we have had good sleighing all the time with the temperature ranging from zero to 24 degrees below that point. It is very seldom that the temperature during winter here is as low as zero; it generally ranges from 20 to 40 degrees above. This winter, however, one is kept busy building fires, as we are not so well prepared for cold weather here as where extremely cold weather is expected and preparations are made for it.

T. A. M.

Iowa, Lyons, Clinton Co., Jan. 11.—We have had a month of excellent sleighing, which is rather unusual for this locality. The Mississippi River at this point has been frozen over nearly a month, so as to be safe for loaded teams. Our natural "bridge of ice" always gives new life to business and a pleasant place for drives. On January 2d, 3d and 4th the thermometer ranged from 10 to 20 degrees below zero. The home market report of grain, stock, etc., is as follows: wheat, 55@72c.; corn (new), 25c.; oats, 15@17c.; hogs, liveweight, $2@2.10; cattle, liveweight, $3@4.50; butter, 12½c. per lb.; eggs, 20c. per doz.

M. G. R.

Neb., Gibbon, Buffalo Co., Jan. 7.—The winter has been very mild so far—no snow of any consequence, and better roads I never saw in any country. Cattle are looking very well. No other kind of stock is kept hereabouts in large numbers.

M. V. C.

Wis., Salem, Kenosha Co., Jan. 6.—The weather is extremely cold, the mercury during the last four days varying from 20° to 12° degrees.

D. L. B.

North Carolina, Brookston, Warren Co., January 11.—We have had a stinging cold so far this year.

M. B. P.

The Querist.

ANSWERS TO CORRESPONDENTS.

The Show Points of the Brown Leghorn.

J. M. D., North Paris, Me., asks what are the show points of the Brown Leghorn.

ANSWER BY HENRY HALES.

Cock.—Comb, bright red, single, upright, medium size, straight, deeply serrated, five or six points extending well over behind, without side sprigs or indentations. The head should be short but deep, of a reddish-bay color, shading into a lighter tint on the neck; eye, red and bright. Beak, yellow with a dark stripe down the upper mandible. Face, bright red without wrinkles or folds. White ear-lobes, large, round and rather pendent, smooth and close to the head, thin and free from wrinkles. Wattles, bright red, long, thin and pendulous. Neck long, well arched and full hackle, the hackles being a rich golden-bay, striped with black; the hackle is best when the color keeps the same down to the lower edge, without becoming yellow next to the breast and back. Back, of medium length and width, very dark red approaching black on the lower part, each feather striped with golden-bay. Breast, black, full, round, and carried well forward. Body, rather broad but heaviest forward, the under part black. Wings, large and well folded; bows, dark red, each feather striped with golden-bay; primaries, black, each feather edged with yellowish-brown; secondaries, black, the outside web broadly edged with brown; coverts greenish or metallic black, forming a well defined bar across the wing. Tail, upright, large and full; sickle feathers, large and well curved, metallic greenish-black; coverts same. Thighs of moderate length, black. Shanks, long, and bright yellow. Feet, same, with a faint dark stripe down each toe, the smaller the better. Upright and proud carriage.

The Hen.—Head, of medium size, dark-brown, shading off to yellow behind the comb, striped with black. Beak, the same as cock's. Eyes and face, the same. Comb, evenly serrated, drooping on one side free from side-sprigs. Ear-lobes and wattles the same as cock's but proportionately smaller for hen. Neck rather long and graceful, yellowish-brown, striped, with black back, dark-brown penciled with a lighter brown. Breast, full and round, of dark salmon-brown, shading off light under body. Body, deep and plump, broader in front than in rear, color brown. Wings, large and well folded; primaries dull black, the outer edge slightly penciled with light brown; secondaries, dull black, the outer web finely penciled with light brown; coverts, dark-brown, penciled with light-brown. Tail, upright, long and full, a dull black color penciled with light-brown outside: inside, dull black. Thighs, slender, medium length, of ashy-brown. Shanks, long, and of a bright yellow. Feet, as cock's. Carriage, not so upright as cock's. Without any white feathers in cocks or hens.

Keeping Sweet Potatoes and Peanuts.

G. H. T., Granville Corners, Hamden Co., Mass., asks how to take care of peanuts and sweet potatoes. He raised a peck of peanuts from 36 feet of ground during the past season, but though they were large and nice, he could not keep them well, and he asks how to do so.

Ans.—Several plans are practiced for keeping sweet potatoes, all of which are usually successful. This is not always the case, however, as circumstances often occur before the potatoes are finally secured, that destroy all chances of success, such as careless handling, exposure to cold or wet, etc. They should be dug before severe freezing weather, dried off in the sun and housed the same day. Many planters have potato houses constructed of logs daubed inside and out, covered with earth level on top, and above this a roof to protect the whole from rain, leaving the gable ends open. Inside this house a bin should be constructed a few inches smaller than the building, and the space between the walls of the bin and those of the house should be filled in with dry sand. As colder weather comes on, the potatoes should be covered with from four to six inches of dry sand, cotton seed or fine straw. Some secure an even temperature by a flue underneath, where fire can be used when necessary. If kept dry and at about 45 degrees, they will be in good order until the first of May. In more northern sections, a dry cellar will answer the purpose. A friend is trying a plan recommended by a Rural correspondent some two years ago. He buried them in a pit, covering it with straw and earth allowing them no ventilation. He gave them a day of sunshine about two weeks after they were pitted; then covered them again. They are keeping finely.

There is no more difficulty in keeping peanuts than in keeping chestnuts. They should not be placed in bulk until cured and dry.

A Good Wagon-Spring Wanted.

O. N. C., Carpenteria, Santa Barbara Co., Cal., says—"I have watched the advertising columns of the Rural for some time in search of a spring that would be just the thing for a farm wagon. We want something effective, durable, cheap and easily adjustable. Undoubtedly there are such springs; why don't the manufacturers tell us of them through the agricultural papers. We want to know where to find them, their price, and what is claimed for them?"

Ans.—There are several columns every week in the Rural at the disposal of manufacturers and dealers for answering the above and all similar questions.

The French Mulberry.

A. H. P., Ashland, Va., asks whether the French Mulberry bears fruit like other Mulberries or is it merely an ornamental tree.

Ans.—See Rural of Nov. 9. It is not a Mulberry. It belongs to the order of Vervains (Verbenaceæ). It is a very fine, ornamental, hardy shrub that, as we say, "ought to be seen in every garden."

The Ever-bearing Raspberry.

N. C., Berlin, Conn., says that the "Ever-bearing" variety of Raspberry is highly esteemed in some parts of Iowa, and wonders why nothing has been said about it in any of the many articles on Raspberries, that have been published in the Rural.

Ans.—What ever-bearing variety is referred to? There are several that bear in the fall—several that bear somewhat continuously. But there is no variety that for that reason is of special value.

A Suggestive Inquiry.

J. A. M., La Cygne, Kan., asks where can he obtain sample fruits in bottles, put up in alcohol for agents to travel with.

Ans.—This question may serve to show our readers how much weight to attach to the specimens shown by some traveling tree-agents.

Prolific Corn.

W. H. E., East Setauket, N. Y., asks whether there is any kind of corn more prolific for light, sandy soils on Long Island than the eight or ten-rowed flesh-colored and white corn.

Ans.—We shall give in a few weeks the information here asked.

Miscellaneous.

R. P. C., Ionia, Mich., asks, 1, where can he buy a barrel of Beauty of Hebron potatoes, and what would be their price per bushel: 2, the name of a *reliable dealer* in music boxes, where he can get a first-class music box capable of playing thoroughly well from 20 to 30 tunes, and of excellent manufacture.

Ans.—Of Thorburn & Co., of this city. They are the introducers of this excellent potato. The price is not yet fixed. It will be announced in due time. 2. M. J. Paillard & Co., N. Y. city.

Mrs. G. H. S., Buffalo, N. Y., claims to have discovered a remedy which three years' test has conclusively proved to be efficacious for driving away the large green worms that infest cabbages, and asks how she can best bring it before the public so as to make some money out of it.

Ans.—We know of no other way than by advertising the sale of receipes for the preparation or device.

J. D. F. W. Preble, N. Y., asks how to make the best kind of grafting wax?

Ans.—Mix equal parts of beeswax, resin and tallow, using an increase of tallow if it is desired to make the wax more yielding.

J. B. P., Sterlingville, N. Y., asks what kind of clover would yield a large crop in his locality.

Ans.—Red.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, JAN. 25, 1879.

We will be pleased to send one or more copies of the RURAL NEW-YORKER *free to any of our subscribers sufficiently interested in its welfare to be willing to hand them to their neighbors for inspection. An intimation by postal card will suffice.*

OUR readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to* THE RURAL PUBLISHING CO., *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

OUR readers are particularly requested to read the particulars of our free seed distribution on p. 65, under publisher's notices, before ordering seeds.

Applicants for seeds will please observe that the postage on ANY POSSIBLE *selection of* TEN *sorts of seeds,* IS NEVER *more than* FIVE *cents. A* ONE-CENT *stamp suffices for any selection of ten varieties* EXCLUSIVE *of the Beauty of Hebron potato, Pearl Millet and Defiance wheat. If the first of these three is included in the list, then a two cent* EXTRA *stamp is needed, and if the second and third are included, an extra two cent stamp is also required.*

A LIQUID MANURE MINE.

AGRICULTURAL chemists generally agree that the manurial value of the liquid excretions of our domestic animals is not less than that of the solids, besides being "quicker," that is, more immediately ready for use as plant food. The solids require to undergo decomposition before all the plant food they contain is ready to be taken up by the feeding roots; but the plant food of the liquids is already in solution, and if properly diluted or mixed with absorbent substances, the plants can avail themselves of it, without delay, for purposes of growth.

Any one who has ever, in a cemented stable or manure cellar, attempted to furnish absorbents for all the urine of a herd of cattle has discovered that he has taken quite a contract on his hands. If he has before kept his cattle in a tie-up where their liquid evacuations went through the floor and were absorbed by the soil beneath, or drained away, he has small comprehension of the quantity produced, and the amount of dry bedding it will take to keep the place so that anybody can walk about there without rubber boots. He will find that long or chopped straw, in vastly greater quantity than he has ever found necessary to keep his cattle dry, will now leave them afloat, surrounded by straw islands, also afloat. In the cellar the manure will exist in the form of soft mush, and it will keep him busy to draw in the loam, muck, or sand required to reduce things to a comfortable state of solidity and keep his pigs from drowning.

Yet it will pay to do all this—to prepare beforehand the sawdust, spent tan, muck or sand for the stable floor, and the necessary loam for the cellar, in order to take up and retain all this mass of fertilizing fluid. In fact we cannot afford not to do it, and he who does it for the first time will receive a revelation of the the quantity of good manure that may thus be accumulated in a season from a stock of cattle, that will quite astonish him, and make him think that perhaps "farming can be made to pay."

An uncemented cellar with a sandy bottom, under a cattle stable, will not save much urine, unless very liberally supplied with absorbent material. If the droppings are received in the cellar upon a raised platform, it will soon become apparent that the fluids nearly all go through and soak into the ground, when only the usual quantity of bedding is used in the stable. This is a point which many overlook, and it is well worthy the attention of those who have barn cellars of this kind. In our judgment it will always pay to cement a manure cellar, unless its bottom consists of very heavy clay or hard-pan. Even then the walls, for a foot and a half upward from the bottom, ought to be made water-tight.

It may be a pleasing thought for those who have old-fashioned tie-ups which have been used many years, that the liquids that have gone through their floors for so long a time are not necessarily lost. If the ground is absorbent, most of these liquids have soaked into it, and in their passage downwards have left their fertility—their potash, phosphoric acid and nitrogen—in combination with the upper layers of soil. We have lately had an opportunity to see this matter very thoroughly tested. Among our not very near neighbors is a legal gentleman who lately come into the possession of his father's farm, and who has quite a notion of being a farmer with all the modern improvements. He has built him a new barn, with a cemented cellar, and all his fertilizing material is now thoroughly saved. The old barn, with its sheep-pens and tie-up directly on the ground, has been torn down, and, at our suggestion, he has had the soil beneath excavated, and spread upon his mowing. That from under the old sheep-pens was taken out only last fall, and consequently its effect is yet to be noted. But the earth from beneath the old tie-up was spread in the spring, several hundred loads having been drawn, and the dirt removed to the depth of nearly or quite six feet. It was our belief that this earth was thoroughly impregnated with phosphoric and potassic salts, and we had no doubt that there were some nitrous compounds there also, for we were aware that earth from beneath old stables had often been lixiviated for the extraction of nitre. Still, we supposed that really the greater portion of the ammonia had escaped. The hired man, who was put to this "foolish job," as he called it, was however soon converted to a believer in the manurial value of this soil by discovering a distinct odor of hartshorn in it, and this continued even to the bottom of the excavation. The coloring matter had not penetrated much below three feet. The excavated earth has proved to be equal to the best stable manure for top-dressing grass ground. The luxuriant and dark green growth of the meadow upon which it was spread is quite remarkable, and strange to say no difference is perceptible in the effect of the bottom layer from that of the top one. How many of our readers have a manure mine like this?

POULTRY INTEREST.

THE poultry interest in the United States is one of great magnitude, very much more so than most persons imagine. Some writers estimate the value of eggs and poultry used by an average of families in this country at a higher figure than the cost of either the beef or flour they use. This is probably too high an estimate, yet there is little doubt that the eggs and poultry together used in many families, represent a value nearly equal to that of either of the other mentioned articles of consumption used by them. This shows an aggregate value of many millions for the whole country.

Without troubling our readers with dry statistics we will simply say that the vast quantities of eggs and poultry used in our large cities are almost incredible, and that the production of them must have required no small amount of industry and energy. Great as this consumption of the products of the poultry yard is in cities, still it is less per head than in rural districts, where so many of the population keep a small number of fowls and consume most of the products. Could the value of all these small flocks of poultry throughout the country be estimated, the results would be truly astonishing. A great consumption of eggs and poultry occurs in the farmer's household, especially in summer, when eggs are cheap and the time required for cooking butcher's meat is needed for other duties.

We will now consider the management of poultry for eggs. Every one knows that eggs are dearer in winter than in summer, for the simple reason that fewer eggs are laid in winter. Now, the question is, how to make hens lay well during winter, so that the best price may be obtained for the eggs. Aside from the natural inclination hens have for laying in spring and summer, warmth and variety of food are the two great stimulants to the production of eggs. How these can be best supplied in winter is the question. Artificial heat is expensive and has a tendency to impart a tender constitution to the stock. So the best way is to have the houses built as warm and comfortable as practicable in a hill side; or they should be banked up on the north and west sides, and have no openings on those sides, except a ventilator on the north side. There should be one of these in the south side also.

Too much has been copied into our American Poultry Books from European poultry literature, where a westerly aspect is recommended: but in our climate nothing can be more absurd; for, while the westerly breezes from the Atlantic over the British Isles are the softest and purest, our westerly and northwesterly winds in winter are the keenest and coldest that we have to endure, and those from which fowls have to be most protected to keep them from freezing. Another mistake often made is the result of reading or hearing of the French system of colonizing poultry; that is, distributing a small number of hens to each of a number of small houses scattered over a large area of ground. This works well in France where the winters are mild, with little or no snow; but how would such colonizing answer in our cold northern winters, when the ground is often covered deeply with snow? It would keep one busy to clear it off, and moreover the poultry could not be kept warm in such small houses. Larger and warmer places to hold more fowls and keep out the severity of the cold that would naturally chill smaller places, are absolutely necessary for the successful forcing of hens to lay in winter. Upon the supply of such warm places, careful feeding, and cleanliness, rests the secret of success.

SHIPPING LIVE STOCK TO EUROPE.

IN every new and therefore untried enterprise carried on independently by different people, many losses must be expected at the outset. As a rule, in every undertaking experience alone can insure unvaried success. It should cause no surprise, therefore, to learn that several shippers not only of live stock, but also of beef and mutton from this country to Europe, have met with many heavy reverses, and that not a few of them have been bankrupted by their ventures despite the large measure of good fortune that has rewarded the prudence and pluck of others, and notwithstanding the splendid prospect of large gains from the trade in the future. A market for their commodities had to be made across the Atlantic in the face of prejudice, competition, and calumny. Suitable means of transportation had to be created, with little or no experience to aid in devising the best methods of doing so; and even the safest system of carrying on the trade had to be learnt by hard experience. Here as elsewhere, the success of regular traders is likely to be built upon the hardships and often the ruin of the pioneers in the enterprise. This winter has taught a harsh lesson to the shippers of live stock. Not a week passes without bringing news of severe losses to them from storm and shipwreck. Several disasters of the latter kind occurred on the exposed Irish coast last week, and in one case at least, large numbers of cattle and sheep were on board the lost vessel and perished. During the tempestuous weather of the last fortnight we have seen reports of three other cases in which a couple of hundred head of cattle and upwards of a thousand sheep were thrown overboard from vessels laboring heavily in the waves. Not improbably more cases than one of the same kind have escaped our notice. Moreover, the list of deaths among shipments of animals, the bulk of which have arrived safely at their destination, must have been very heavy. Experience seems to show that the exportation of meat, if not as profitable in some cases as that of live stock, is, on the whole, a far safer investment. This must be decidedly the case during stormy winters like the present, and it is not unlikely that the lessons now given will have a salutary effect in future.

PELARGONIUMS.

WE have cultivated a great number of house plants during our lives and the Geranium, as it is commonly called, has given us as much satisfaction as any other. The house Geraniums, as we have often explained, are not the plants known in botany by that name. They are hardy and several of the species, like Geranium maculatum, the Spotted Geranium—G. Robertianum, Herb Robert, are natives of this country. But the Pelargonium is from the Cape of Good Hope and this is the plant to which we now refer. Thousands of varieties have been produced from seeds, either crossed or self-fertilized, and it would seem that further improvement is scarcely possible. They are almost ever-blooming and the colors range from white through every shade of pink and red to a deep plum. A few years ago, we had but a few double varieties and they were all red, differing only in their "doubleness" or size of truss. Now we have among the double sorts all the colors to be found among the single varieties. As house plants they require but a modicum of care. Insects rarely trouble them and they will thrive in any soil. Indeed, we once tried the experiment of cultivating them in pure white sand and water. The experiment was tried for six months. They lived and maintained very good health, though the growth was less thrifty and the plants never bloomed.

After enjoying Pelargoniums in the house, throughout the winter, no plant is better for bedding purposes out-of-doors. They should be well cut back and planted out for this climate about the first of June. We find that many of our friends make the mistake of keeping the same plant for several years. Of course, they will live for many years. We once saw a Pelargonium ten feet high with a stem ten inches in circumference, that was, if we remember rightly, twelve years of age. But if we would have large, healthy foliage, large trusses of full flowers, cuttings must be taken every summer (late August is the best time), and in this way we secure new plants every year. We commend the Pelargonium especially to those of our readers who have only a sunny window in which to gratify their love of flowers.

SUNDRY MATTERS.

THE next special number of the RURAL will be a CORN number. We would thank our subscribers for any facts relative to varieties or culture, which may be the outcome of their experience. Probably no other crop has ever excited a wider or deeper interest than does corn at the present time. How to produce the greatest yield at the smallest expense is the question we would gladly throw light upon. Statements to the effect that certain farmers have produced 150 or more bushels of shelled corn to the acre are of no value. We can not treat the corn plant in the field as we would a choice flower in the conservatory. The yield of corn from a small plot under fussy cultivation is no indication of what the same variety of corn will yield if treated as large areas must be treated by the average farmer. We have heard of plots of land producing corn *at the rate* of 200 bushels of shelled corn per acre. We have heard of plots of land yielding potatoes *at the rate* of 1,000 bushels per acre. Such statements, if intended to show what can be done with ordinary field culture, are misleading and harmful. It is just as sensible to suppose we can raise in our woods trees as shapely as those upon our lawns, as that we can equal in our fields the best results of the highest cultivation in garden patches.

During last fall, and since, we have been trying to ascertain what variety of corn has produced, under ordinary circumstances, the best yield, intending to secure a quantity sufficient to enable us to distribute among our farmer subscribers enough of it for trial. We need not particularize further at this time. We will finish our present Free Seed Distribution first. This has assumed proportions which, to speak freely, have frightened us a little lest we should be unable to do all we have promised to do. But it is working smoothly now and we hope to end it in time to send out other seeds before another planting season. We would avail ourselves of this opportunity to express our appreciation of the support which the RURAL NEW-YORKER is receiving for 1879. Week by week, we might almost say, day by day, our circulation has greatly increased over the corresponding period in '77 and '78, notwithstanding our heavy storms and the much talked of hard times. We feel a strong inclination to thank everybody in a "broadcast" way;—but our readers would, no doubt, prefer that we should display our gratitude in other ways. To the continued improvement of our paper, therefore, to the well-being and the well-doing of our readers, we set ourselves earnestly and heartily to work without further ado.

BREVITIES.

THE article on Gates will be found of interest to all farmers.

WILL those who have not received stamps for the postage on corn sent to this office, please notify us?

IN answer to a number of inquiries we would say that Bohemian Hulless Oats are not *new* but very old. They have no special merit that we know of, and he who buys them at a high price, or with "great expectations," will be disappointed. Under various names this old variety has been revived again and again. It is now offered under the name of Chinese Hulless also.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

HER OPINION OF THE PLAY.

BY VANDYKE BROWN.

Do I like it? I think it's just splendid!
You see how I speak out my mind,
And I think 't would be better if men did
The same, when they feel so inclined,
But no, you're all dumb as an oyster,
You critics who sit here and stare,
Look grave as a monk in his cloister—
You have'nt laughed once, I declare.

I'm sure there's been lots that was jolly,
And more that's exciting, you'll own;
Why, I pity the poor hero's folly
As if he were some one I'd known!
And wasn't it grand and heroic
When he shielded that friendless girl Sue?
'Twould have quickened the pulse of a stoic,
But, of course, sir, it couldn't rouse you!

And then for the villain, De Lancey—
Now doesn't he act with a dash?
Such art and such delicate fancy,
And—did you observe his moustache?
He made my very blood tingle
When he threw himself down on his knees—
Do you know if he's married or single?
Yes, the villain—there laugh if you please!

I admit I know nothing of action,
Of unities, plot, and the rest,
But the play gives complete satisfaction,
And that is a good enough test.
Yes, I know you will pick it to pieces
In your horrible savage review,
But, for me its interest increases,
Because 'twill be censured by you.

I should think 'twould be awfully jolly
For the author to make such a hit;
How he pricks all the bubbles of folly
With his sharp little needles of wit!
I am sure he is perfectly charming,
Or he never could write such a play—
I declare, sir, it's really alarming
To have you sit staring that way!

And oh, if I only were brighter
And not such a poor little dunce,
I should so like to meet with the writer,
For I know I should love him at once,
Yes, I should, though you think it audacious,
And I'll tell him so, too, which is more,
And—you are the author—good gracious!
Why didn't you say so before? [*Bazar.*

DESCRIPTION OF CUTS.

FIGURE No. 1.—A fichu *jabot* is here illustrated. It is composed of two standing frills of narrow Valenciennes lace, which form the neck, and to these are attached two falling frills of much wider lace; a band of foundation lace serving to stay the arrangement in the proper outline. Where the wide frills meet at the neck they are joined by a

No. 1.

seam to the extremities which reach to the waist line. The seam is so made that the *jabot* terminates in a point, while a rose with its foliage is caught at the point of the neck ruchings. The opening at the neck is large enough to permit the article to be slipped on over the head, and the neck of the dress is turned under at each side to form a heart-shaped outline.

Figure No. 2.—The design of this *jabot* is simple and comparatively inexpensive. It is composed of a broad scarf of silk, with oval ends and a border of Valenciennes lace. The scarf, after the border has been applied, is caught in two upright loops under a cluster of blossoms and its ends are allowed to fall in careless folds which are lightly secured just as they fall. A small cluster of blossoms is at the bottom of the *jabot*, and a still more tiny one is caught between the borderings at the right side. The scarf may be white or any of the delicate evening tints, and can be secured to a narrow band to pass between the collar of the dress and the collar or frill worn inside the dress-collar.

Figure No. 3.—A ruche and *jabot* of black lace are represented here, and are very pretty to wear with light or dark dresses. The picture so faithfully delineates the construction, that no description is necessary.

Figure No. 4.—A handsome Pompadour, with a neck ruche and a long *jabot*. Wide insertion is selected for the body of the Pompadour, the stripe being joined under a tiny band of silk. A narrow line of Swiss insertion heads the frill of lace edging the Pompadour, and underneath it is laid a strip of silk of the color of the piping. The seam con-

No. 2.

fines the ruche plaited about the neck and may extend through the center of the *jabot* if desired. The *jabot* is formed by slightly gathering two long strips of lace and extending them in lengthwise lines, which causes the fullness to fall in cascade waves that may or may not be tacked at each side. The blossoms in this instance are all that seem necessary to hold the frills in place. White and black lace interminglied make a pretty half-mourning ornament of this kind, and violets may be substituted for the roses.

Figures Nos. 5 and 6.—This fichu is square across the back which extends as deep as a yoke; while at the front it descends in squarely outlined tabs nearly to the belt. The foundation is coarse Brussels net, on which strips of Valenciennes insertion are flatly sewed so as to show spaces of the net between them. The entire edge, including the neck and the overlapping front, has a border of deep lace set on with a trifle of fullness. The cuff

No. 6.

is formed in the same manner, with a frill finishing its pointed top. If preferred, fancy net may be used for the foundation with good effect, either in the Spanish or Guipure variety, and of course the border must match the net. Knots of velvet, satin, plush, or grosgrain ribbon may be used at the top and bottom of the closing, or clusters of flowers may be substituted for either.

I would like to say a word or two in praise of using *black* lace in making fichus and *jabots*. The average woman when she wishes to make her black or dark silk look "dressy," almost invariably decides to use an enormous quantity of white lace. For myself, I have always disliked a great splash of white on a dark dress, and it seems strange to me, that women should so seldom tone down the intense whiteness by a judicious mixture of black lace, and that they should appear so blind to the greater elegance and richness of *all* black lace articles as decorations for black silks.

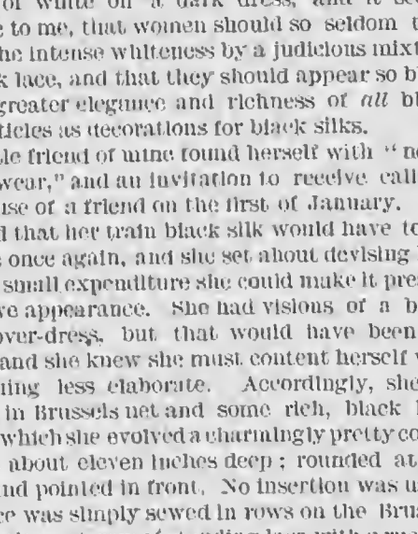
A little friend of mine found herself with "nothing to wear," and an invitation to receive calls at the house of a friend on the first of January. She decided that her train black silk would have to do service once again, and she set about devising how with a small expenditure she could make it present a festive appearance. She had visions of a black tulle over-dress, but that would have been too costly and she knew she must content herself with something less elaborate. Accordingly, she invested in Brussels net and some rich, black lace, out of which she evolved a charmingly pretty collar. It was about eleven inches deep; rounded at the back and pointed in front. No insertion was used; the lace was simply sewed in rows on the Brussels foundation. A row of standing lace with a ruching of white lace inside finished it around the neck. The sleeves of the dress were made in plain coat style with cuffs, these the girl ripped off and turned the edges of the sleeves back so as to make "elbow sleeves" of them, these she ornamented with frills of black and white lace. Some dark red silk roses and buds finished this really elegant set of lingerie.

THE BOY.

His Life Treated in three Chapters.

CHAPTER I.—"IT'S A BOY."

His advent is heralded in the brief but strong sentence just quoted. No matter what hopes have



No. 3.

been indulged in concerning girl babies, there is something in the pithy announcement "It's a boy," which dispels all fanciful dreams and sets everybody squarely on a prose basis. His very voice, as it utters a defiant war whoop in the grand army of humanity, tells the story to experienced years. The visions of a dainty girl darling very soon vanish before this positive piece of prose, who kicks his sturdy heels through the delicate pink socks intended for his sister, and who grows red as a turkey cock's head at Thanksgiving times when he is expected to show off before callers. He persists in an abnormal development of nose and a puffiness about the eyes, along with several other tricks known only to interested parties. Parents and nurses become reconciled and accept them on trust, seeing no other alternative. He emerges from his puffy and rosy obstinacy to a roly poly wide awake thing of beauty, which is a joy fully one-half of the time. There is a process from infancy to little boyhood, a sweet time, when the man-child is half baby, half angel. In the clear depths of his innocent eyes is a world of hope and trust and love. His white brow is as fair as a freshly-opened lily, and his lips as sweet as hermosa roses. He is most witching at this age, for the peculiarities which mark the *enfant terrible* are yet undeveloped. He is an armful of love and beauty and promise and dread and hope. Love him while yet there is no guile on the tender lips, no sin in the unwritten soul, no touch of the world upon God's finished work.

CHAPTER II.—"GIT UP OLD HORSEY!

"Mercy, what a noise! Look at that chair, with a string tied on the arms and made fast to the writing desk and flower stand, all to be driven tandem by that young imp in knit shirt and fancy hat and shoes! Who upset that work-basket? and, good gracious, what work has been made with my wool and thread! There's the Graphic torn to scraps and stuffed in the cuspadore with my screw-driver that I lost a week ago. What is he doing with that cat? and, dear me, if he hasn't thrown grandma's spectacles into the grate."

No. 4.

Where's Harry? Run to the kitchen and see. All the eggs are broken in the basket of folded clothes, and the milk for pudding has been fed to the cat and dog. Bridget Lannigan is in a towering rage, and says, "Phat's the use of shlavin to kape clane wid such a young divil furninst ye?" Miss Frigidity Fussbunch calls, and is horrified by being requested to "be a horse and let Harry ride straddle to Boston." She is questioned, also, on many delicate points. He gets very close to her and asks what that white stuff on her face is, and what makes her wear such a funny little hat.

A few years of this juvenile terror and then there appears another stage of the boy. He gets a fever only appeased by marbles. It is useless to head off this phase; if it is shut off in one direction it breaks out more violently in some other. It goes through a period of six or seven years and costs much mortified pride. He is afflicted with rats, pigeons and other boyish complaints, which are harmless, but annoying. He brings in dirty steel traps to amuse his sick sister, who grows worse under it, and in his solicitude he straps his legs fast to six feet of stilts and stoops to enter the door of her room, to the horror and dismay of his mother. He brings little notes home from school, which he tries to explain in a favorable light, but fails to convince his parents that it was "only because Bill Wilson dropped his slate on Abe Hennegan's toes and made me laugh." He carves his awkward initials on old Mrs. Williams' cellar-door, and she threatens his arrest. He goes to see "Humpty Dumpty," and goes home and throws real brickbats at his aunt, and Bridget is met with a battering blow from his head when she is bringing in the coal. He makes life a burden and home a snare and delusion. He tears the comforts in more ways than one, and slits the pillow-cases to match them. Gradually he leaves off his hurly-burly life and imperceptibly glides into

CHAPTER III.—"WHERE'S MY BLUE TIE?"

"Where is the blacking brush? I am going to a little surprise and won't be home till eleven. Is my percale shirt done up nice? I wish you'd make my collars stiffer. I don't thank some one for throwing my coat down and getting it wrinkled all up. How do you like this hat? Think it looks better than my soft one." You will find the pigeon boxes all deserted about this period; not a rat trap cumbers the back yard; the woodshed theatricals are all ended; the stilts are put away; kites forgotten; window glass is in perfect safety. The dust has filled the rude initials in Mrs Williams' cellar door, and there is an uninvited quiet all around the house; chairs stay in their places, and pantaloons will no longer bear cutting over for the boy. He gets them now out of new stuff, and mother's "cut" will not satisfy him. He is not in the way now, and there is a heavy pain in mother's heart as she thinks he will never need her much any more. The innocent eyes have a deeper meaning in them now. They have taken into their depths the reflection of a face younger than mother's, and life begins to look real to them.

The world is full of homes where these pictures will be recognized and hung up as family portraits homes where there are no sounds of young voices now. They grow away into the great world so soon, and we put away the nameless feeling of desolation as we do the cast-off toys of their children; and when the evening of life approaches the heart goes back along the line of time, and is once more with the children in the dear old long ago.—*Cincinnati Saturday Night.*

A WORD OR TWO.

ANNIE L. JACK.

A WRITER in the Literary Department of the RURAL takes exception to the fact that so much space is devoted to cooking recipes, fashion and fancy work, and no effort made toward mental improvement. I am sure the Editors of the paper are willing to do all in their power to provide variety for their readers, and they know well that nothing is more necessary than the best preparation of food; that the fashion patterns, so often slightingly spoken of, are very useful in a family, and a great saving of dressmaker's bills, and that even fancy work, home-made, besides being a pleasant recreation, is a cheap form of household adornment. If any one doubts it, let him inquire the price of such articles at a fancy store and see what a saving is effected by having them home-made, while the work is generally better done. But the writer speaks a few words that I can fully indorse, when mentioning the Society to Encourage Studies at Home. I am now in the fourth year of my connection with this charming method of study, and have found it both instructive and delightful. My children being under seventeen, I became a member, and have had such pleasant instruction, such helpful "pen-talks" with earnest, talented women, that I feel under a life-long obligation to them for glimpses of botanical and geological knowledge, and for help in all departments of natural science that I should not otherwise have obtained. There are *branches* now in several cities, and it will always be a wonder to me that so many gifted women give their time and thoughts to aid their unknown sisters without reward except that of their own good conscience.

HOW A SEDENTARY LIFE AFFECTS WOMEN.

THE Popular Science Monthly remarks that many of the ills and diseases prevalent among women in our day are no doubt traceable to the sedentary mode of life so common among them. The progress of the industrial art has done away with much of the household drudgery to which women were formerly subjected, and the result is in too many cases want of sufficient occupation for needed bodily exercise. It says; "The fruit of this state of things are strikingly exhibited in certain observations made by the late Dr. Robertson, a Manchester surgeon, who in his practice as a specialist for women's diseases, found that in women who themselves performed all their household work there was no trace of certain complaints, that these complaints begin to make their appearance in women with one servant, become more pronounced with women who have two servants, or worse still with those who have three servants, and so on." On the other hand we observed a statement the other day that since the suspension of labor in the mills of New England on account of the panic, many of the female operatives have sought employment as domestics, and as a consequence there is much more sickness among them than there was previously. This would seem to show that housework is not as healthy as labor in cotton and woolen mills.—Troy Times.

No. 5.

CANCER CURE.

MRS. W. C. GIFFORD, Jamestown, N. Y., is the name and address of the lady who sent us the article on Cancer Cure which we published some weeks ago. As we know nothing whatever of the cure in question, we shall have to refer all inquiries to the lady above named.

DEVONSHIRE LACE CO.—Can any of the RURAL readers give the address of the above-named company?

Literary Miscellany.

WEAKER THAN A WOMAN.

CHAPTER XXVI.

(Continued from page 46.)

SHE was one of the most fearless of maidens; all the high courage and undaunted bravery of her race lived in her. She put her drawing-materials aside and went towards the place whence the sound had proceeded. Her heart beat fast when she saw before her the prostrate figure of a man. There was no sobbing now, only a death-like silence, and the man lay with his face downwards. She did not faint, or scream, or run away, but she listened for his breathing, this dainty daughter of a noble race. Was he dead? Had he swooned? Was he hurt? She grew pale and trembled when, on the cool green grass, she detected stains of blood. Once, twice she spoke to him, and then she raised his head and looked into his face. How handsome it was—just such a face as she had seen given to a Greek god—such a face as she had seen in marble in the dim light of old Roman galleries. Then she saw that on the temple, so white, so rounded, so full of ideality, there was a terrible wound. A moment's reflection showed her what the wound was. Just above him was the branch of a tree. He must have been running in hot haste, and, not seeing the branch with its sharp, jagged edge, had run against it. He had fallen there, and had swooned, probably because the blow had stunned him.

What a handsome face it was, but how terribly marked with pain! What did all those great lines mean on the fair brow and round the beautiful mouth? Warm pity and tender compassion rose in her heart for him. She laid the helpless head on the grass again, and went and dipped her handkerchief in the brook. She laid it on his brow; she bound up the cruel gaping wound, and then hesitated what she should do next. His head lay upon her arm, and she looked like an angel of compassion bending over him. Suddenly, to her great relief, he opened his eyes and gazed at her.

"Violet!" he said.—"I am not Violet," she replied.

She saw his whole face change.

"Oh, Eve, Eve," he said, "you told me of the angel of pain, but the trial was more than I could bear!"

"I am not Eve," she told him gently; but from the dim shadowed look in his eyes she knew that he did not hear her.

Gently and quietly, with softest touch, she bathed his hot brow with the cool water of the brook until she saw that his senses had returned to him.

"I found you here, badly hurt," she said.

He tried to rise, but he was quite unable to stir. She laid her hand upon his arm.

"No," she said, "you must not try to stand—you will feel better soon. You are dazed and giddy—you must have struck your head against this branch. Where were you running so quickly?"

"Away from the sound of the bells," he answered. "I knew that I should not hear them in the depths of the Bramber Woods."

"Did they distress you?" she asked. "I thought them so beautiful."

"They drove me mad—they were killing me," he replied. Then with a low cry he bent his face towards the long grass.

"I feel sure that I have seen you before," she said. "Do you know me? I am Lady Maude Bramber; and you—I have seen you at the Towers. Surely you are Mr. Felix Lonsdale, the dear old lawyer's son?" He looked at her.

"Yes, I am Felix Lonsdale," he replied; "and I begin to think that Heaven has placed a black cross against my name. I ought to have known you, Lady Maude. I remember you now, but my head was all confused."

"Your face is quite familiar to me," said Lady Maude. "You came to the Towers with your father—it is four years since—and you took luncheon with us. I showed you some of my drawings, and you were very shy. It comes back to me so vividly. But, Mr. Lonsdale, why were you running from the sound of those bells?"

She saw a spasm of pain pass over his handsome face; his lips trembled.

"Do not agitate yourself," she said kindly. "Do not tell me if it pains you."

"All the world—all my world—knows it," he replied. "I will tell you, Lady Maude. I ran, mad, blind, reckless, from those bells because they are chiming in honor of the marriage of the girl I loved—the girl who had promised to marry me."

"Surely," said Lady Maude, with a light breaking over her face, "you do not mean your pretty golden-haired sweetheart, Violet Haye? Your father told us about her that day at the Towers."

"Yes; she has married Sir Owen Chevenix today, and the wedding-bells were driving me mad."

"Poor boy," said Lady Maude, rather to herself than to him, "I am not surprised at it. You shall not tell me about it now," added Lady Maude, after a silence of some few seconds. "It is the old story, I suppose, of trust and love, folly and treachery. Tell me of your home, your father—I was always very fond of your father. How is he?"

Sympathy was so sweet. They were sitting under the great boughs of the spreading elm. Lady Maude's just and gentle heart ached with pity for him. It seemed to him such a relief to talk to her. He felt weak and languid—woman's sweet, soft words, woman's pity and sympathy, were very acceptable to him just then.

He did not speak of Violet, but he told her the story of his father's bitter trials—how Mrs. Hardman's money was left to them, how happy it had made them, what plans and hopes they had built on it; then of the disputed will, the trial, the verdict; how his father's business had fallen away from him, and his old friends had one by one deserted him, all but Eve Lester; and he told her how Eve had come to offer her fortune to them.

Lady Maude's eyes filled with tears as she listened.

"That is a girl after my own heart," she said. "But do you mean to tell me, Mr. Lonsdale, that this is the outcome of English law? I have never heard of so cruel a case. All who know your father know that he is as incapable of doing wrong as any man in England—in fact, he would not do wrong—he is one of the noblest of men. I have always heard him so highly spoken of. You do not mean to say that his fellow-townsmen and the old friends who have known him for years stand aloof from him for this?"

She spoke with angry indignation that did his heart good to hear.

"It is true," he replied; "and, what is more, they have withdrawn their business from him—some under one pretext, some under another. We have had a struggle such as few could understand, and my great fear is that my father will never be a strong man again."

"He wants a reaction," she said—"something that would put him back into his place—that would reinstate him in public opinion; and he shall have it. I will tell this story, just as you have told it to me, to my father, and I am sure this is one of the wrongs he will hasten to redress. I am glad that I have seen you, glad you have trusted me. There has been a gross miscarriage of justice."

"Human laws must always be more or less imperfect," returned Felix. "It is only the Divine laws that have no flaw."

"Tell me more of Eve Lester," said Lady Maude. "Your fair false Violet does not interest me, but Eve Lester does. I love noble women—tell me of her."

He told of her patience, her heroism, her noble, gentle, generous life; and Lady Maude, looking at him, wondered why, when he understood the beauty of her fair soul so well, he had not loved her in preference to Violet.

"Men are all the same," she thought; "a fair face will lead in any direction. They lose their heads when beauty comes upon the scene; they are not strong-minded as a rule." Then with a smile she looked up at Felix.

"The little mouse in the fable freed the lion. I will be the mouse in this instance, and I promise you such help for your father as shall make his trouble really a blessing in disguise."

He thought of Eve's words and repeated them to her. She smiled.

"Your friend Eve is right," she said. "Sorrow is often a blessing in disguise. I am glad that I have met you; you will go home all the happier for knowing that the hour of your father's triumph is at hand. You will have something to distract your thoughts from fair, false Violet; and, remembering my promise, the fourteenth of September, her wedding-day, will not be the most unhappy day of your life after all."

He thanked her until the tears came into her eyes again; and then he told her that he was better, and asked her to let him walk with her to the end of the woods. When he tried to stand up, he looked very white and ill—she almost feared for him; but the giddiness soon passed, and they walked together to where she had left her drawing-materials. He thanked her again and again so simply and earnestly that she was charmed. Then she left him, and went away home.

Felix had intended to take up his burden bravely and carry it nobly; but human love and human passion were too strong for him—he could not face the world just yet. He stayed all night in the shelter of the Bramber Woods, doing hard battle with his despair; he watched the sun set, and the moon rise; he watched the golden stars come out one by one; he watched the chequered shadows that the moon threw upon the grass; he listened to the wind as it sang its sweet song; he thought of all the moonlit nights on which he had met Violet. He fell asleep for a few short moments, and dreamed that he stood under the wet lilac-bushes with her; her arms were clasped round his neck, her beautiful face was raised to his, and she was scolding him that even in a dream he could believe her false. He woke with a cry of rapture. There lay the cold moonlight, there stood the giant trees, and Violet had married Sir Owen.

All night he stayed there. It was the one terrible battle of his life. He was not ashamed to impart all his sorrow to the listening stars. There were times that night when he almost went mad, when he cried aloud for death. But Heaven was merciful, and death came not. The morning light found him pale, weak and exhausted; but that one fierce paroxysm had taken the sting of his sorrow away. It was better than if he had gone home and been ill for long days and weeks. That one fierce night of pain exhausted him; when it had passed, he was too weak and too tired to suffer more.

He went home in the full light of the morning, and found Kate waiting for him. She had guessed what had happened. She had not spoken of his absence, but she looked anxiously at his face when he came in. He bent down and kissed her.

"It is all over, madre," he said. "Now I shall live down my pain."

Kate looked sadly at the wound on his broad white brow.

"How did you cut yourself so terribly, Felix?" she asked; and he told her. It was one of his great merits that he never spoke a false or evasive word.

On that same night Lady Chevenix sat with her husband in a first-class railway-carriage on the road to Paris. They were to spend their honeymoon there, and they had left Dover by that night's steamer. As the night grew darker and the red lights of the signals passed more quickly, she fell into a deep troubled slumber. Her husband looked with exultant pride at the marvelous face with its exquisite beauty; he was glad that she slept—it would rest her, and would help to while the hours away. He tried to sleep, but it was impossible. He was exultant, triumphant; he had won the only thing wanting to complete the happiness of his life. His heart hungered as he looked at the graceful figure of his wife. He noted with pride and pleasure how the handsome traveling-dress became her sweet loveliness.

"The folly of that lawyer to imagine that such a woman as this was born to live in a place like Lilford! His year's income would not find her a decent dress. He will recognize his mistake when he sees Lady Chevenix."

It was strange that no feeling of pity for his rival or remorse for his own behavior crossed his mind. He did not seem even to understand that he had done a dishonorable thing. He had outwitted another man, and he was delighted. Then he saw the face that he was watching grow paler in sleep. Suddenly his young wife awoke with a loud cry. He saw her look at both her hands, while her white lips trembled.

"What is it, Violet?" he asked.

"A dream," she replied, shuddering—"only a dream."

"Very horrid things they are too, sometimes," he said. "What did you dream?"

She was still looking at her hands, rubbing the softly-tinted gloves as though she would fain rub something from them. She was too confused to be quick at invention.

"What did you dream?" he repeated—and there was a certain sharpness in his voice.

"I thought that I held a human heart in my hand, and that it was bleeding," she replied.

"That would do for a sensation novel, Violet," he said, laughing. "You have something better than a heart in your hand—you have a diamond ring on your finger worth two hundred pounds, and you have a wedding-ring that makes you Lady Chevenix. Go to sleep again, but dream of diamonds, my dear, not hearts—as whist-players say, diamonds are trumps."

But sleep had gone from Violet; she watched the skies until morning dawned, and more than once, although she was Lady Chevenix of Garswood, one of the wealthiest women in England, she wished that it were all undone, and that she was Violet Haye again.

On that same night Lady Maude and Lord Arlington talked long and earnestly. She told him the story that she had heard, and asked him for help. He thought long over it.

"I know of one way in which I can help him, Maude," he said; "but that will require consideration." Then he said a few words in a low voice.

She clasped her hands.

"Will you do that, papa?" she interrogated. "That would be one of the grandest things in the world. I shall be so pleased—far more pleased than at any good fortune which could happen to myself."

"I will think of it," replied Lord Arlington; and when he spoke in the tone that he did then his daughter knew that he was determined to accomplish what he had in view.

CHAPTER XXVII.

There was great excitement in the town of Lilford. As one man said to another, they might always expect something strange when the Earl came home; but this was stranger than all. The Earl's tenants, and every man in Lilford with whom he did business of any kind, received an invitation to dine with the Earl at the "Bramber Arms."

The "Bramber Arms" was the chief hotel in Lilford. It boasted of a large assembly-room, where the county-balls and the hunt-balls were all given. It was the very stronghold and fortress of the aristocracy of the neighborhood, and its resources were wonderful. The dinner to the tenants was to be served in the assembly-room. People called it a rent-dinner, such as the Earl generally gave to his tenants once a year; but they agreed that there was something more in it than that, or why were so many bidden who were not tenants? Why were the doctors, the vicar, and every other person with whom the Earl had any business relations asked, and many more besides? The Earl, it was remarked, rode or drove through Lilford every day, and he was sure each day to give three or four invitations. Public expectation and excitement increased. What could the Earl mean by such unlimited hospitality?

The proprietor of the "Bramber Arms" gave glowing accounts of the dinner that was to be prepared. No expense was to be spared. He was to provide the choicest dishes. He declared that during his business career he had known nothing like it.

Felix heard of the grand banquet, the rent-dinner, as it was called, and went home one evening pleased to have some news that would interest his father. When he reached Vale House he was astonished to find that two letters of invitation were there before him, one for his father and one for himself.

"That is wonderful," he said. "Why has the Earl invited us?"

Nor was his wonder much decreased when in his father's letter he read a few words written in the Earl's own handwriting, and signed "Arlington"—a few kindly words, begging Mr. Lonsdale, if possible, to be present, as he very much wished to see him.

"That means good news for you, father," he said. He had never mentioned his interview with Lady Maude, neither had he forgotten it.

Mr. Lonsdale shook his head gravely.

"There will be no more good news for me in this world, my dear boy—no second Will-o'-the-wisp will ever lead me astray. For the future I shall believe in nothing but what I see."

"You will find that I am right," said Felix. "You will go, will you not?"

"Yes, I will go, just to show my fellow-townsmen that, while they treat me as a thief or a swindler, the Earl of Arlington treats me as a gentleman. I will go, if only to show them that. Yet I have some misgivings, Felix. If they avoid me as they have done, it will kill me. Felix, what if his lordship has heard nothing of this story, and has invited me in ignorance? What if, when he finds it out, he avoids me too?"

"My dear father, why dwell on trifles? Lord Arlington says expressly that he wishes to see you. Surely you do not doubt his word? He has been so much in Lilford lately that you may be quite sure he has heard the whole history."

In his heart Felix felt certain that Lady Maude had told her father all about it, and that this invitation of the Earl's had something to do with her communication. He placed his arm caressingly round his father's neck.

"You may get better, father," he said, "and come with me."

(To be continued.)

WHAT HAPPENED TO SEVEN GIRLS IN TEN YEARS.

MARY WAGER-FISHER.

(Continued from page 30.)

The promise was faithfully kept, and the letters, by a hocus pocus of circumstance have fallen into my hands. Before giving them below, *verbatim et literatim*, I open a photographic album and take a look at their faces. Here is Zethrea—a wholesome looking girl—round faced, red cheeked, tall and lithe, superb black hair, beautiful hands—feet and teeth ditto, only these do not show in the portrait. She had been educated at Mt. Holyoke and lived at Cairns Point, N. Y.—a refined, affectionate and merry maiden scarcely out of her teens. This brown haired, brown eyed, smiling girl of exquisite complexion and a very fully rounded form, is Lee Jaynes, she belonged to Schenectady, N. Y.—a simple hearted, guileless, conscientious child. Of the "Cookies" it has already been hinted that one was dark and the other fair. The faces of both are very sweet and lovely; both had an exquisite sense of the ridiculous, of taste in dress, and abounded in the practical good sense and thrift of New England. Their home was in Nashton, N. H. Mary Roswell's face is not easily described. It is full of character, full of sadness, and some bitterness of expression lies about the mouth. Her life had been full of adventure and much too full of misfortune. She was born in the Sandwich Islands, where both her parents had gone as missionaries, and where both died and had been buried. Orphaned, she was placed in charge of the Missionary Board, and brought back to America by way of China. During this homeward journey, still scarcely more than a baby, an accident befell her from which she never recovered, and which made the doing of every kind of work more difficult for her than for those about her. But devoted to an unusual degree, and endowed with the true missionary disposition, she achieved great things in her way, overcoming all obstacles with a brave and dauntless spirit. She was the one person in the world that took the Lord at His word and *trusted* in it; although there were many times in her life when she had reason to believe that He had forgotten all about her. In person she was short—she wore her dark hair "shingled," which well became her round and rosy face; her smile was winning and her eyes dark blue. She had the knack of relating her experiences in a pleasing and graphic way, and some of her sketches have appeared at times during these past ten years in the columns of various journals. Mary Walter was the tallest of the girls, of light build, and decidedly individual in style and manner. Her picture shows a large eyed girl, with a rather delicate face, with brow and temples too much shaded by dark curling hair; she was college bred, quick tempered, high-strung nature, whose only faults lay on the surface, and who had gone as an "N. T." for the novelty of the experience. Mercy Biddle's face would have done up well as a Friend's—it had a fairness and reposedness about it that savored of Quakerdom. But she was only an old-fashioned, plain Methodist girl, with a Saxon's fairness, and a wealth of long fair hair simply coiled at the back. Her face was one to please and to win confidence at a glance. A strong, earnest face, full of positive convictions.

Now for the letters, which are given in the order of their dates. The first is from Mary Roswell:

SAN FRANCISCO, last of December, 1876.

DEAR OLD CHUMS:—Ten years! Is it only *ten* years since we sat in Walter's room that New Year's night? It seems like twenty at least, as I look back at the past. I suppose each one's life seems as eventful to her as mine to me. But I hope no one else of our band has been through as much as I have in these ten years. From Richmond I went (after you left for your homes in the summer) to Nelson Co., Va. You all remember the circumstances: one of the F. F. V's., with sixteen children, wanted a teacher for them. Sometimes I think I ought to have stayed longer with them; but I thought I could not, and from there I went to Staunton, Va. where I taught a year. From there, after a visit North, I went to Charleston, S. C., commissioned as teacher to the freedmen by the Presbyterian General Assembly. There I made a failure of teaching, as I always did in a city; after a few months left there and was sent to Winnsboro, S. C., where I was soon stationed by myself in the country. No one else would go to that station—it was so isolated. I lived there fourteen months, teaching in an old, dilapidated four-story brick building, formerly a theological institute. I was often very lonely, but I had plenty of work and felt that I was doing good. I had a Sunday school and a night school all the time, besides my usual day school. When at last it was deemed best to close the school there, and remove me to another station, a colored man indignantly exclaimed: "I'll never have anything to do again with the Presbyterian Persiety! Here I have been sendin' twelve chilen to you all dese fourteen mumfs and now they takes you away from me!"

From there I went still further into the country and taught in a log cabin with no windows, and only a hole for a door.

This was in the winter of '70 and '71 and South Carolina was greatly excited then. After vainly waiting for a better state of things, I closed the school and soon after went North.

But in the meantime, January 13th, I had been married. I cannot well speak of my marriage and the years that followed, for even now, that it is all

past, my heart cringes at the thought of those long dark months and years. And too, some of you have said things (to others) that pained me sadly, implying at least, that I deserved all I suffered. I will not dwell upon this, only to say this much (though I presume you will not believe it), I know all that any of you do and *more*, and I say now that I wronged no one, neither do I see how I could have done any other-wise than I did.

I was married January 13th at Winnsboro, S. C., by the Rev. Mr. Richson, our missionary superintendent. My husband returned soon after to Florida, intending to resign an office he held there and come North: in the meantime I chose to remain and continue teaching. But instead of resigning, he lost his office (County Judge) and lost what property he had, so he was unable to go North, and I went on with my school until compelled to close it as I have said. I went North for a time, but in June he asked me to come to Florida, thinking he had the means of supporting me there. I went, glad to go to my *home*, for I had never had one. But I stayed only three weeks. It was a long, hot journey there, but it was a longer one back, for those three weeks had been very painful ones. I was sick when I returned—sick in body and sick at heart. I went into a hospital and stayed until my baby was born, October 6th. I wanted to die, but God would not let me. I will not weary you with the years that followed, years of weary struggle to support myself and child. I was under matron in the Home for the Friendless, for a time; two summers I took charge of a house (this in New York city); was in Philadelphia for a time; then in New Jersey; was city missionary for a time; was for some months in Saratoga County, N. Y.; taught a colored school in White Plains, New York, etc., etc. I hardly *know* how I managed to live. Sometimes I did not taste meat or butter for months, and *once*, when I was nursing my baby, a wee puny thing, I had nothing to eat for several days but a five cent loaf of bread, and only water to drink. And yet in the midst of this all, and while my heart was *racked* with suspense and bitter aching, so I longed for nothing so much as to lie down and die, with my baby, I heard the remark, "If *I* had no more to trouble me than *you* have," and "How *easily* you take everything—it would *kill me*." So do we misjudge others. We know so little of the bitterness of the lot of other hearts. Still through it all, God's loving hand led me, His loving care never failed me. He was *not punishing* me for any wrong I had done others. I do not know the "Why," but I know it was not done in anger. Always he spared something for me. Sometimes I did not know one week where I could find shelter for the next; but it was always provided before the week was gone.

And then my boy—I can never tell the precious comfort he was to me. God-sent comfort. You know how I always wanted to be a mother. And although I was in grief and suspense almost every moment, yet in the midst of it all, my heart would *throb* with joy that I was a mother, though my next thought would be, "Oh, my God, let us both *die*."

He was a funny morsel, as monkey-like as a human being could well be, and every one said I could not raise him. But every day of his little life, from the very first, was most precious to me. I did not care how he *looked* or anything—he was *my baby*, my own little one—my God-sent treasure, and he, and he alone kept my heart from breaking. But I am making a long story. My husband died May 5th, 1875, at Pensacola, but it was six months before I knew the particulars or even the certainty of his death. He was my *husband*—the father of my precious boy. Only God can judge him now. In the fall of 1875 an uncle in California sent for me to come out here. I came by steamer. I was worn out with trouble and anxiety, and no hope of anything better here. I only wanted to die with my boy.

The voyage recruited my strength somewhat, and I tried to get something to do here. I taught a Chinese school for a time, but I was not strong enough to teach. Everything failed me, or I failed in everything, just as at the East. But the morning broke at last, a bright, peaceful morning. God sent me one to love me and care for me, a true, good husband. I was married again in May 1876, and my husband is all a true woman could ask for. My married life now, is as near perfect happiness as any thing on earth can be. My heart is all *rest* now. I am so happy I hardly know myself.

We are poor and always shall be, in purse. But *rich* in love, we three, and in God's dear love. Our little home, (*my home* at last!) is quiet and peaceful, a *resting* place. My husband is a laboring man, a Swede by birth, rather tall and spare, plain looking and of very few words, but true hearted and kind, an earnest Christian, and he *loves me*. Not one thing about him, would I change if I could. My boy Herbert, is fine and healthy, though still *small*. He is as smart (and good looking, too) as any you can show. He is perfectly satisfied with his "Papa." He said one day, "When papa first came to see us, before we married him, we thought he was just like any other man, did'nt we? We did'nt know how good he was, did we mamma?"

As for me, these ten years have changed me, I am older, am quite gray and instead of weighing from 125 to 130 pounds as I did once, I only weigh now from 90 to 100, but I am pretty well, so that I am happy.

In reading over the above I find I have said nothing of the kindness of friends during my long night of trouble. God sent me many friends who were strangely kind. I don't know how I should have lived without them. Mercy Biddle did me a great many kindnesses. All I had ever done for others was repaid to me "four-fold, good measure, pressed down, shaken together and running over," and I sometimes think the best of all of the happiness I have now, is the being able to do a little for others again.

Well, now, Walter, Raynor, Biddle, Lee and Cookies, how are you all? I wonder if Mrs. Hawley has changed her dress yet? I have no Richmond news. How I wish I could see you. We are all so changed, no doubt, I only hope you are all as happy as I am now. God bless and keep you all in His holy love and keeping. We shall never meet here, I fear, but may no one be missing from our band on the other shore. Yours truly,

MARY ROSWELL WILLIS.

(*To be continued*)

ADULTERATIONS OF FOODS.

FROM the Boston Transcript we extract the following summary of a paper read before the Social Science Congress at Boston by Geo. T. Angell. The subject with which it deals is one of vital importance and it deserves more than a passing notice. Unless we are prepared to subsist exclusively on vegetables and fruit, to live with paperless walls, carpetless floors, and to confine ourselves to skins for clothing, it behooves us to be up and doing in this matter of poisonous adulterations in food, wearing apparel, and wall and floor coverings.

"Take the adulteration of foods, for instance. One of the most eminent chemists of Massachusetts tells me that almost every class of articles now sold in this country for food is more or less adulterated, and that many of these adulterations are extremely poisonous. [Hayes, Bowditch.] For instance, cayenne pepper is adulterated with red lead, mustard with chromate of lead, curry powder with red lead, vinegar with sulphuric acid, arsenic and corrosive sublimate. It is stated in the Scientific American that probably half the vinegar now sold in our cities is rank poison. [Ploughman, Dec. 1, 1877.] One of our Boston chemists analyzed twelve packages of pickles, put up by twelve different wholesale dealers, and found copper in ten of them. [Massachusetts Board of Health Report, 1873.] Another chemist analyzed sixteen packages of pickles and found copper in all of them. Many of our flavoring oils, syrups, jellies and preserved fruits contain poisons. The adulterations of tea are too numerous to mention. Coffee is not only adulterated, but a patent has been taken out for molding chicory into the form of coffee berries, and I am told that clay is now molded, and perhaps flavored with an essence, to represent coffee. Cocoa and chocolate are adulterated with various mineral substances.

Several mills in New England, and probably many elsewhere, are now engaged in grinding white stone into a fine powder for purposes of adulteration. At some of these mills they grind three grades—soda grade, sugar grade and flour grade. [North Adams, C. W. Elliott, April Galaxy, 1877.] I am told that thousands of tons of it have been ground in the towns of Massachusetts. It sells for about half a cent a pound. Flour has been adulterated in England, and probably here, with plaster of Paris, bone dust, sand, clay, chalk and other articles. I am told that large quantities of damaged and unwholesome grain are ground in with flour, particularly with that kind called Graham flour [To detect adulterations of flour see Sanitarian, November, 1877.] Certainly hundreds, and probably thousands, of barrels of "terra alba," or white earth, are sold in our cities every year to be mixed with sugars in confectionery and other white substances. I am told by an eminent physician that this tends to produce stone, kidney complaints and various diseases of the stomach. A Boston chemist tells me that he has found seventy-five per cent. of "terra alba" in what was sold as cream of tartar, used for cooking. A large New York house sells three grades of cream of tartar. A Boston chemist recently analyzed a sample of the best grade, and found fifty per cent. of "terra alba" in that. [Hayes, March 23, 1877.] Much of our confectionery contains thirty-three per cent. or more of "terra alba." [Sheldon.] The coloring matter of confectionery frequently contains lead, mercury, arsenic and copper. [Massachusetts Board of Health Report, 1871.] Baking powders are widely sold which contain a large percentage of "terra alba" and alum. [Baltimore News, Nov. 17, 1878, from Scientific American.]

In 1874 a "medical commission" of five physicians appointed by the "Board of Health" of Boston, reported that over a million and a half gallons of water were sold as milk in that city in that year, for which nearly $500,000 in money was paid. They state further, that this water is likely to be taken from impure streams and barnyard wells, and so to produce typhoid fever and other infectious diseases in those who drink it. In one instance thirty-four cases of typhoid fever were produced in twenty different families by drinking milk mixed with water taken from a well standing near a cesspool. ["English Sanitary Record." Boston Journal, Feb, 25, 1876.] The high death-rate amongst infants in our cities is largely attributable to adulterated milk. In one year, for instance [1868], while there were 457 deaths of "cholera infantum" in Suffolk County, in the same population outside the city there were less than 100, [Massachusetts Board of Health Report, 1873.]

It is not water alone that is mixed with milk. Thousands of gallons, and probably hundreds of thousands, are sold in our cities which have passed through large tins, or vats, in which it has been mixed with various substances. I am told that after being drawn from these vats it tastes better and will keep longer than pure milk. Receipts for the mixture can be bought by new milkmen from old on payment of the required sum. I am assured, upon what I believe to be reliable authority, that thousands of gallons of so-called milk have been, and probably are, sold in this city which do not contain one drop of the genuine article. Probably this kind is principally sold to the poor.

Large quantities of the meats of animals, more or less diseased, are sold in our markets. Cows, in the neighborhood of our large cities, are fed upon material which produces a large flow of unwholesome milk. Poultry are fed upon material which produces unwholesome eggs. Meats and fish are made unwholesome, frequently poisonous, by careless and cruel methods of killing. [Lobsters, trawls, etc.]

Butter is not only manufactured in enormous quantities from animal fats, obtained probably in many instances from diseased animals, but this also is now still further adulterated with an article still cheaper. It is estimated that during 1877 there was manufactured in this country about 75,000,000 pounds of this butter. It is estimated that in 1878 there was manufactured not less than 90,000,000 pounds. It is estimated that during 1877 more than 40,000,000 pounds of cheese was manufactured here from the same material. A large portion of these products are so disguised as to deceive the public, and are sold as the pure, unadulterated product of the milk of the cow. In these products have been found, by analysis, horse fat, fat from bones, and fat such as is principally used for making candles; and the whole prepared with a heat not sufficient to kill the parasites which enter and breed in human bodies. It would require a volume to explain the adulteration of foods sold in our markets, many of which endanger health and life; and they are constantly increasing. What is being done to stop these adulterations? So far as I am aware, nothing whatever.

Large quantities of our so-called European wines and liquors are manufactured here, shipped to Europe, reshipped and sold here as the pure juice of the grape. A large portion of our California wines are made in Boston cellars. An eminent Massachusetts chemist, who has had a wide experience in the analysis of wines and liquors, tells me that of all the wines and liquors sold in eight places out of ten through the State of Massachusetts it would be safe to say that more than ninety per cent. are adulterated.

Now take our drugs and medicines. Here I cannot do better than quote the exact words of an eminent medical gentleman of Boston. He said to me, "The adulterations of drugs in this country are perfectly abominable. The physician orders a medicine for a patient in extreme danger. The medicine has only a quarter the strength it should have, because of its adulteration, and the patient dies."

I am told by the secretary of the Michigan State Board of Health that a large portion of our tin-ware contains lead in a soluble form. In Michigan several children have died from drinking milk which had been kept in tin pans of this kind. I am not aware of any reason why the tin-ware of Massachusetts should be less poisonous than the tin-ware of Michigan and Pennsylvania.

The use of arsenic, corrosive sublimate and other poisons has become common in ladies' dresses, in veils, in sewing silks, in threads, in artificial flowers, in gentlemen's underclothing, in socks, in gloves, in hat linings, in linings of boots and shoes, in paper collars, in colored enameled cloths and doubtless in many other articles. A child in Troy, N. Y., recently died in convulsions by taking arsenic from a green veil thrown over its crib to keep off flies.

Wall papers containing arsenic are largely manufactured and sold; also poisonous papers used for curtains, lamp shades, boxes, about confectionery, for tickets, cards and various other purposes. A friend of mine recently visited one of our New England factories where these papers are prepared. He found there about thirty barrels of arsenic. The employees were required to work only two days in the week. Many of them were made sick by that; some had died. The proprietor kept away from it. In railroad, lecture and concert tickets there is frequently enough arsenic to kill a child.

These arsenical wall papers are of various colors—green, blue, red, yellow, pearl and other colors. Some are cheap, some costly, some figured, some plain; some glazed, some unglazed. The amount of arsenic imported into this country during the year ending June 30, 1875, was two million three hundred and twenty-seven thousand, seven hundred and forty-two pounds (2,327,742). Each pound contains a fatal dose for about 2800 adult human beings. Yet it is sold in our markets almost as freely as wood and coal, at a wholesale price of from a cent and a half to two cents a pound. The editor of a leading Boston paper has recently stated in his editorial columns that it is estimated that about eighty-five per cent. of our wall papers now manufactured contain arsenic. A Boston gentleman recently purchased in different parts of that city twenty samples of kerosene oil, and submitted them to a skilful chemist. He found that eighteen of the twenty were dangerous, and sold in violation of law. It is said that the great Chicago fire of 1870 would never have occurred if the fluid in a single lamp which caused it had been of the proper legal standard.

There is little or no profit to the seller, who, in ninety-nine cases out of a hundred, would prefer to sell honest goods, and enrich only those manufacturers and adulterators, some of whom, regardless of the laws of God and man, are little, if any, better than the pirates that plunder our ships on the ocean, or the highwaymen who rob and murder on the land. Laws should be enacted and enforced prohibiting the manufacture and sale of these poisonous and dangerous articles under severe penalties, and compelling the manufacturers and sellers of adulterated articles to tell buyers the precise character of the adulterations. I have not a word of fault to find with our "boards of health." They are doing great service. But this work is beyond their power. If they should earnestly undertake it they would be opposed at once by combinations of capital and political influences which would either secure their removal or paralyze their efforts. Under our form of government there is but one remedy, and that is in the formation of "public health associations" in our cities, composed of influential citizens, supported by voluntary contributions, employing officers who cannot be bribed or removed by outside influence, and who would make it as dangerous to manufacture and illegally sell poisonous foods and other poisonous articles in our markets, as it is now to cruelly beat horses or starve cattle."

ADVANTAGES OF CRYING.—A French physician is out in a long dissertation on the advantages of groaning and crying in general, and especially during surgical operations. He contends that groaning and crying are two grand operations by which nature allays anguish; those patients who give way to their natural feelings more speedily recover from accidents and operations than those who suppose it unworthy a man to betray such symptons of cowardice as either to groan or cry.

He tells of a man who reduced his pulse from 126 to 60 in the course of a few hours by giving vent to his emotions. If people are at all unhappy about anything, let them go into their rooms and comfort themselves with a loud boo-hoo, and they will feel 100 per cent. better afterward.

In accordance with the above, the crying of children should not be too greatly discouraged. If it is systematically repressed the result may be St. Vitus' dance, epileptic fits, or some other disease of the system. What is natural is nearly always useful, and nothing can be more natural than the crying of children when anything occurs to give either physical or mental pain.

REAL WORKINGWOMEN.

IT is an odd spectacle to witness scores of women doing the work of longshoremen on the wharves of St. John's, Newfoundland. When the time arrives for vessels from Southern Europe, Brazil, West Indies, and elsewhere, to take aboard their cargoes of salt cod, herring, etc., files of buxom females, with tucked-up gowns, bared arms, and coarse brogans, may be seen along the wharves, carrying flat barrows of fish to and fro. Each barrow has four handles, and is borne by two women. They perform the same labor as men at this business, but their pay is inferior. In fact, they seem to work more arduously than their male co-operators, and continue to do so the same number of hours. Women also go on the "summer voyage" to Labrador, and act in the capacities of "splitters," "salters" and "headers."

RECENT LITERATURE.

Parturition Without Pain. Eighth Edition, enlarged. M. L. HOLBROOK, M. D. New York: Holbrook & Co. Price, $1.

IT is most necessary that every family library should contain standard works on Physiology and Hygiene. This is especially true of farmers' libraries, for while city people have doctors "to right of them, doctors to left of them," (which is perhaps a rather questionable advantage) and have, moreover, ample opportunity to consult medical works in the public libraries or to listen to lectures on these all-important topics; the farmer's family is dependent on the village doctor—who may live miles away—for all knowledge of the human form. Hardly a farmer in the land but what purchases books which treat of the diseases of cattle, horses and dogs. Books of this class have always a ready sale, for the farmer knows that it is only by the careful study of diet, exercise and rest in their relations to health, that he can hope to keep his live stock in good condition, but when it comes to a question of children, how many books does he buy? how much does he study? Most fathers wash their hands of all responsibility and leave the child's life and well-being in the hands of the mothers who are, quite likely, as ignorant as themselves. Mother-love will accomplish much, but it cannot supply the place of absolute, accurate knowledge of the proper care of children. The world is full of poor little humans, deformed, weak in mind and body, who, by reason of their parent's ignorance are compelled to lead lives of pain and anguish. Attention to the simplest of nature's laws would have made them vigorous. When one reflects on the amazing, yes, appalling ignorance of parents, the wonder is not that so many children are feeble, but that any are robust.

The work under notice should be carefully read by every mother. It is written in a clear, popular style, and the suggestions are admirable. The use of drugs is discouraged and people are recommended to live naturally, and by proper diet and exercise to become well and to remain so. Contributions from Mrs. Elizabeth Lady Stanton (who, though the mother of seven children, maintains that there need be no ill-health among women,) from Mrs Duffey and Dr. Clemence Lozier, enhance the interest and value of the book. We consider the work admirable in every particular and it would afford us much pleasure to know that every Rural household contained a copy of it.

As It May Happen: A Story of American Life and Character. 12mo, extra, cloth. $1.50. Philadelphia: Porter & Coates.

THIS is a remarkable work. Its most striking feature is the originality of the characters which, while not distortions, are still far removed from the conventional creations which appear in the average novel. The dialogue is natural and sprightly and the action is rapid. The author displays a skill in the development of the plot which is found only among superior writers; this is particularly noticeable in his treatment of the mysterious element which plays a conspicuous part in the book. The pure tone of this novel makes it most acceptable to all who turn with disgust from the many works published in these days, whose questionable morality appears to be their sole recommendation to public notice.

English History in Short Stories. New York: A. S. Barnes & Co. Price $1.

THOSE who must be contented with instruction in homeopathic doses will find this little work to be most valuable, and even those who have had the advantage of extensive reading will applaud the compiler for this ready, accurate and comprehensive text-book. It is embellished by notes on heraldry and the titles of nobility, and contains quite a detailed explanation of the government of England. In short, a book that so adequately adapts itself to both youthful and advanced readers is worthy of library or table space.

Lord Beaconsfield, when recently asked "how long he thought the Conservative Government would last," quietly replied: "As long as it pleases Providence to spare Mr. Gladstone to the country."

News of the Week

Monday, Jan. 20, 1879.

POLITICAL.

The work of the House has been interrupted by extraordinary mortality among its members, not less than four having passed away in the course of as many weeks, under circumstances which cause grave suspicion of the unhealthfulness of the Capitol or of the city of Washington. Three of these were from the South, and all happened to be democrats. The ablest of them by far was Gustav Schleicher, of Texas, a native of Germany, who had resided here since 1847. The House by a vote of 127 to 77 rejected a bill to reimburse William and Mary College, Va., for losses incurred in the war. Only four republicans voted in the affirmative and many democrats in the negative.

Mr. Edmunds has introduced a joint resolution prohibiting any bill passed by either House from being sent to the other after 12 P. M. of March 1, and any bill or resolution passed by both Houses from being sent to the President after 12 P. M. on March 2. This measure is designed to prevent the rushing through of bills just at the close of Congress, hitherto a fruitful source of jobbery, trickery and error.

Though Senator Sharon of Nevada has held his office for nearly four years and drawn almost $30,000 for pay and mileage, he has not been a month in his seat altogether hitherto. Some of his colleagues had never seen him until his recent arrival at Washington, and very few of them had made his acquaintance. He is 68 years old and is described as short and thin, light-complexioned, unprepossessing in figure, and weighing hardly more than 100 pounds.

Since the democrats organized the Indiana Senate they are more confident of pushing through the Legislature a partisan gerrymandering scheme. A bill has already been introduced, which throws most of the republican congressional majorities into a single district and gives the democrats a chance to elect nine members out of the thirteen.—In other words, gives the republicans a dose of their own medicine.

MISCELLANEOUS.

The Cincinnati Commercial's summary of murders and homocides in the United States in 1878, aggregates 1,326. The killings are put under thirty-three classes, some of which are these: "Killings on account of dogs, 4; killings on account of wives 64; wives killed, 68; parricides, 8; wives killed husbands, 11; negroes killed, 112; negroes kill, 102; bagnio fatal quarrels, 10; men killed in common quarrels, 258; bar-room and drunken quarrels, 74; fratricides, 14; wronged women kill seducers, 6; fathers kill sons, 18; killed in political quarrels, 14; deaths from abortion, 12; poison, 25; killed by thieves, 57; mothers kill children, 37; accidental killings, 69; mobs, 29; cards and gambling, 15; officers killed 53, and 36 officers were killed The Illinois Department of Agriculture, at Springfield, has received crop reports from a majority of the southern counties of the State, which indicate that the winter wheat was never in so good condition as at present. The heavy snows have protected the grain, and the ground is reported in excellent condition. Live stock is also reported in good condition.

Col. W. S. Clark resigns the presidency of the agricultural college at Amherst, Mass. The explanation seems to be that the trustees have discovered that President Clark is rather an expensive luxury. The college will retrench for the present by getting along without any head. It is probable that Prof. Stockbridge will be made acting president and no president chosen for the present. There was another severe snow storm over a large part of the country last week. Here 'twas the heaviest of the year. Many blockades on the railroads. Fifteen miles of cars are said to have been snowed in on the N. Y. Central, while it is stated that the loss from all causes during the snow embargo was $65,000 to the New York Central, nearly $50,000 to the Erie, and $45,000 to the Lake Shore road. These are only sample cases of what has generally been the results throughout the North and West.

Reports from nineteen Western railroads of their December business, show gross earnings amounting to $6,609,190, an increase over those of the same month in 1877, of $115,717. The figures for the year are: Gross earnings, $83,528,761; increase over 1877, $4,577,925. On last Tuesday, week, there were in the Chicago elevators 5,556,662 bushels of wheat, 1,945,988 bushels of corn, 427,933 bushels of oats, 226,684 bushels of rye, and 1,166,762 bushels of barley, a total of 9,324,029 bushels, against 9,060,977 the previous week, and 2,800,698 at the same time in 1877. New York and Brooklyn warehouses contained 3,812,000 bushels of wheat, 2,950,000 bushels of corn, 1,069,000 bushels of oats, 564 bushels of rye, and 918,000 bushels of barley. Grain in sight on the 21st of December: Wheat, 10,917,000 bushels; corn, 9,059,000 bushels; oats, 2,969,000 bushels; rye, 1,565,000 bushels; barley, 5,600,000 bushels. Exports from seaboard ports week before last included 97,488 barrels of flour, 1,104,420 bushels of wheat, 639,289 bushels of corn, 19,944 bushels of rye, 6,968 barrels of pork, 6,420,174 pounds of lard, and 15,797,917 pounds of bacon. Hamilton Fish was elected president of the Union League Club at New York the past week. Gov. Hampton of South Carolina is steadily mending. The export trade in live stock is assuming magnificent proportions in Canada. An English firm is reported as negotiating with Toronto exporters for twenty thousand head of grade Short-horn cattle and fifty thousand sheep of the Cotswold and Leicester breeds. This immense number is composed of the choicest animals, and the entire lot is to be delivered at Liverpool before the close of June next.

Dun & Co's, the commercial agents, report of the failures for 1878 cover 10,478, the highest ever reached, the total liabilities being $234,363,000, also the next highest being $228,499,000 in 1873. The decline in the value of staples and the haste to take advantage of the national bankrupt law are the most probable causes of the increase. At the final meeting of the Centennial Commission in Philadelphia, Wednesday, thirty-nine States and Territories were represented. General Joseph R. Hawley presided and delivered an address. The closing report of the Executive Committee was read and accepted. The report of the committee appointed to audit on finances were presented and adopted. The gross receipts of the exhibition were $11,161,611,55; expenses to date, $10,997,980,59—leaving a cash balance of $173,630,96.

All matters connected with the transportation of his products to market are of importance to the farmer, as they influence the price of his goods, hence it is gratifying to learn that the canals of this State have been exceptionally successful this year. A new system of management which keeps them apart from politics, went into operations last February and in the four remaining months of the fiscal year the expenses of the whole year were reduced $310,580, as compared with the year before; while at the close of 1878 they had been reduced from $851,729 in 1877 to $140,817—nearly one-half. This has also been accomplished without impairing the condition of the canals in the least, while their tonnage has increased 214,859 tons and the net revenue $245,871.

The conference between the representatives of the trunk line railroads and agents of ocean steamship lines running from New York was held at 29 Broadway Wednesday. The object was to make some arrangement for sustaining uniform rates on freight shipped for export from the West. The railroad men presented a plan adopted last week to prevent the cutting of rates. The steamship agents expressed their willingness to cooperate, if the railroads would agree to ship all their export freight by vessels of lines composing the Northern Atlantic lines. A conference committee was finally appointed to consider the matter. The proposition of the steamship companies would rule out the alleged Vanderbilt Unicorn line of steamships just established. It is said the railroad companies want to force upon the fast passenger and mail steamers the same rates of freight that the New York Central will secure by the Unicorn line.

Thomas Lord, the millionaire whose marriage with Mrs. Hicks about a year ago created such a sensation, is at the point of death. He has taken no solid food for two weeks, and his stomach will not retain fluids. He is about 85 years old. The Teller Committee is reported to have taken evidence in New Orleans, which demonstrates the existence of gross intimidation of voters at the last Presidential elections. The Potter Committee is about to investigate those cipher telegrams.

The hostile Cheyennes, imprisoned at Fort Robinson, Neb., since last October, having been informed a few days ago that they were to be taken back to their agency in the Indian Territory, became very sullen, and repeatedly expressed a determination to die before consenting to such a movement. They were shut up in a frame building, and in order to force them to consent to go South they were deprived of food and fire for five or six days, and of water for 24 hours, and the windows were removed from their prison through this intensely cold weather to freeze them to subjection. Driven to desperation they at last took advantage of the carelessness of the military guard, and at 10 o'clock at night, when nearly every one was in bed, they jumped through the windows and made for the prairie, which was thickly coated with frozen snow, firing on the guard from revolvers they had concealed since their capture, dangerously wounding four, two of whom have died. The main guard rushed out of the guard-house, and, following them up, killed over 40, including eight squaws and two children. Over 100 of the cavalry, mounted and dismounted, followed, but were forced to return for provisions. Since then the pursuit has been vigorously carried on, and all the fugitives either killed or recaptured, except 19. At latest accounts, these were holding a detachment of troops at bay. Much excitement among the Sioux.

A Military Court is in session at Chicago inquiring into the conduct of Major Reno at the battle of the Little Big Horn, where Custer and his command were massacred. Charges have been repeatedly made that were it not that Reno's cowardice on that occasion prevented him from going to the assistance of his gallant commander, the issue of the struggle might have been different. He demanded an official investigation into the matter, and hitherto some strong testimony for and against him has been taken.

FOREIGN.

The distress among the working class in Great Britain is still increasing. The workhouses are being filled to their utmost capacity. Private charity, though liberal, is insufficient to more than mitigate the suffering. There is a fierce struggle between labor and capital. Manufacturers find that to prevent their trade from passing into American and continental hands a reduction in the price of their wares is absolutely necessary. This they insist must be brought about by lowering the wages of their workmen. The latter say the vast profits of the capitalists should be diminished instead, and refuse to consent to the curtailment of their pay. During the past week several large strikes have been inaugurated, chiefly among the miners in Wales and Cornwall. In the manufacturing cities of Warwick and Lancashire the men have been locked out of a number of the most extensive factories and work suspended until the proposed reduction is agreed to. There is a strong probability that both labor and capital will emigrate largely, both to this country and Australia. Already the North Wales Mining Association is offering $33.88 to every member of the Union who desires to emigrate to America and $67.76 to those preferring to go to Australia. By this means the number of operatives, it is hoped, will be so reduced that the remainder will be able to get higher wages—according to the old doctrine of supply and demand.

In France the Republicans, having gained heavily at the late elections, are insisting that to the victors belong the spoils. They maintain that all governmental officials who are not openly of their party should be dismissed and red-hot republicans appointed in their places. To this the Government refuses to consent, and a Ministerial crisis is imminent. There is a good deal of talk about the possible resignation of MacMahon rather than his submission to the dictates of the triumphant party. It is said that Gambetta supports these demands, with a view to his election to the Presidency after the termination of MacMahon's term, in 1880. Now, as usual, agitation in France is having a disquieting effect throughout the rest of Europe. In Germany the agitation about protective duties in favor of home products is still the chief topic of public interest, over-topping that taken in Bismarck's proposed legislation to punish the abuse of free speech in the Legislature. This measure seems to excite greater indignation abroad, especially in England, than in the Fatherland. There is just now a report, also, that the great Chancellor intends to introduce a law authorizing the government officials to open suspected letters coming from other countries, in order to prevent the dissemination of objectionable political doctrines through means of the mail. Matters out in Afghanistan are nearly at a standstill, owing to the severity of the weather. Yakoob Khan is said to have followed his father in his flight.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

MOP-HANDLE PAPERS.—No. 12.

MAY MAPLE.

A Sewing-Circle's Household Wisdom.

"WELL I declare, if Mrs. Hester Douglas isn't more nice than wise, then my name isn't Rachel Ray;" and the *petite* lady drew up to the table that was covered with work and surrounded by ladies of various ages, both married and single; for this was society day.

"You see," continued Rachel Ray, as she adjusted her thimble and took up an apron to finish, "I called to see if Hester would not come to the sewing circle with me. But, dear me! didn't I know it was Saturday and that it was every housewife's cleaning day? anyway, if it wasn't, it ought to be. For her part, she had work enough to do at home; and if the ladies who attended the society every week would look around their houses, they'd find enough to keep them busy. She always cleaned her house every Saturday from garret to cellar. She must finish scouring the cellar stair and the wood-house steps. She s'posed most of folks would think they would do with washing occasionally, or sweeping once or twice a week; but she always scoured hers with plenty of soap, sand and elbow grease. And then the swill barrel, pail and dipper always came in for their share of the weekly scouring, too. And she'd warrant there wasn't a society woman who ever even washed those articles. But she had her opinion of such neat people. And she'd no doubt but the heathen that they were so anxious to provide for, might give them many a lesson in the art of housekeeping. "And the way she scoured and washed each step was certainly an example of hard work," continued Rachel, dropping her sarcastic tone.

"Yes, and very useless work, too, I should say;" said Mrs. Wright, the merchant's wife. "I quite agree with you in thinking Mrs. Douglas more nice than wise."

"Well, I never thought of the cellar stairs or the swill barrel being a test of neatness. To be sure, one might judge of one's economy by taking a peep into the swill barrel. But to me the idea of scouring it is quite new," said Mrs. Plainwell.

"My way of testing a housewife is by the doors; if they are kept clean about the latches, I'm not afraid but the rest of the house will be found comfortably tidy, in most cases;" said motherly Mrs. Burton, who never fretted or criticised if things did not look precise and altogether in style.

"I never have any doubts as to a housekeeper's capabilities if I can take a peep at the floor of her sleeping room. Now there is Louise Upton who always keeps her floor so clean that one can rub it with a cambric handkerchief and not soil it, and every thing about her house is off the same stamp;" said Mrs. Tilden. "For my own part, I never sought for fame in that direction, and do not expect my neatness will ever bring laurels to my brow." We all knew that the speaker was in no wise slack in her household.

"Aunt Ruth, what do you think of all this striving after excessive neatness?" said Rachel Ray.

"Why," said the serene-faced, quiet lady addressed, "the Good Book tells us that cleanliness is next to godliness. One can be clean without going into such extremes as have been spoken of this afternoon. Our Saviour rebuked Martha for being so troubled about matters pertaining to the household that she could not find time to entertain her guests without fretting about her work. He also commended Mary for having chosen the better part. She had no doubt cultivated her mind, and made herself more agreeable to the friends who gathered in to pay their respects to the family. To Mary life meant something better than scrubbing and cleaning. While Martha could see no use in pouring over parchments and high-sounding literature. It is the same now. We have our cultured Marys and our house-cleaning Marthas, and the work of feeding the soul and caring for the body still goes on, one extreme balancing another. But I believe those who can reach a happy medium and make themselves equally sharers of mental and physical labor, carrying neither to excess, are really the most useful and therefore the most contented."

HOW TO CARE FOR CHILDREN.

I WOULD like to bring a smile upon some poor, tired woman's countenance by telling where my boy spent most of his time when small. Our house was cold, and I did my work alone, so we took a dry-goods box two feet square—a smaller one would do nicely—put some carpet and an old quilt in the bottom, borrowed some casters from a bedstead, so it could be easily moved, and, lastly, put in some playthings and baby. For washing days alone, it would pay for itself, and besides one can feel safe if up-stairs or down-cellar. The top was just high enough for him to see out, and was also rasped off smooth, so he learned to walk by going from side to side, never getting bumps like children who walk by chairs. Never mind if he does cry, at first; as our good old doctor said, it hurts the mother worse to hear him, than it does the child to cry. But many children would be quite contented for a reasonable length of time. Our box would not go through the door, but I'll warrant the little ones would enjoy having it out of doors on a warm summer day.

Keep the high chair tied to the table leg at top and bottom, and when washing your dishes, put the baby in that, tying him in, of course, and give him some new plaything. I do not mean that one should always keep buying, but don't give a child everything at once. Old tin-ware and rag dolls, a chair for a horse, or a pail of rags to wash (without any water), with a string across the chairs to hang them on, is as good as all Broadway can afford. Don't begin by putting out of a child's reach articles that he cannot have, unless it be the shears and butcher's knife; but say, no, to him firmly, and perhaps at first it is well to take the child away from the object. If he persists, slap his hands, and, finally, if that is not enough, put him in the box, or tie him up. As he grows older, do not give him a lifelong horror of neatness, by *always* refusing him anything because it makes a litter or soils the clothes. If Mrs. Grundy should chance to call, she will only find out that you think more of your child's happiness than you do of her opinion.

Make children's clothes plain and of dark material, so they can be washed easily, and let them play in the sand, if it be dry. It might not answer in the city, but if you live in the country where people are accustomed to it, begin taking your children to church when young. Let them know, at first, that they cannot, under any consideration, get down from your lap, and I don't believe it will take very long for them to learn how to behave in church.

Having had some experience in croup, I will say that one of the best remedies I have yet found is a piece of flannel saturated with ice-cold water, bound tightly around the throat and changed often.

AUNT MARY.

HYGIENIC PIES.

I HAVE just finished reading a communication from "Sarah Gamp," and permit me to give my ideas of hygienic pies.

True, if pies "are well made and eaten in moderation they do no harm," but the great point to be gained is to have them "well made," and we all know how few housekeepers have reached perfection in the art. In the first place, it is not at all hygienic to use fine white flour to make your pie-dough, no hygienist uses it for any purpose. In the second place, it is not hygienic to use lard or butter. Let me give you a recipe for a strictly hygienic pie, copied from the cook-book of the well-known hygienist, Dr. R. T. Trall.

Graham Pie-crust.

"Pour boiling water into Graham flour and stir to a soft dough; roll out as thin as possible; sprinkle a little of the flour over the pie-plate, and spread this as the bottom crust. Make the top crust by mixing Graham flour with ice-cold water; add grated cocoanut if desired, knead as quickly as possibly to a stiff, hard dough; roll very thin; cover and bake immediately."

That is pie-crust, and for the contents, I will quote his recipe for apple pie.

"Spread the bottom crust on the plate; on this spread a few dates, stoned and cut into small pieces; sift a little Graham flour over this, and lay on the apples in slices or stewed; if the fruit is very juicy sift on more flour; cover with the top crust; have the fruit extend close to the edge of the crusts, which should be wet so that the top and bottom crust will adhere at their edges; with a knife roll the edges under so that they will be smooth; bake immediately, being careful not to have the top crust much browned. As soon as done, cover tight with a dish about two inches deep, and let it steam till cold, when the crust will be very tender."

Now that is *strictly* hygienic, and if the RURAL readers object to it, let them continue to make their pies in the old way, but I entreat them to substitute Graham flour in place of the fine white flour, and use as little "grease" as possible.

MRS. W. V. ASPINWALL.

KEEPING ACCOUNTS.

I WONDER how many of the RURAL families keep an account of household expenditures? It is a very satisfactory practice as it enables us to show whether we are living within our means or not. Parents need not keep the family expense account, if there are children who are old enough to do so. The habit will give them ideas of business early, and teach them the value of money. Provide a suitable book and see that every expenditure is promptly and correctly entered. If the work is well done, give the child a word of commendation now and then by way of encouragement. I knew a family who would not keep accounts believing that it made people penurious, (they lived on the generosity of a wealthy relative) but it seems to me there can be no excuse for such a result. On the contrary, among the most benevolent persons I ever knew, were those who kept cash-books in which the smallest expense was noted, with date of the same. It is fair to say that the pages of their account books were never marred with the record of money expended for tobacco, cigars or spiritous drinks. Is not so admirable an example to young men worth thinking about?

M. G. R.

Lyons Iowa.

QUESTIONS ANSWERED.

Turnip Tops.

E. L., Linn, N. Y., asks: Can the shoots which grow out of old turnips, at this season of the year, be used in any way for the table?

ANS.—Yes; they are considered by many to be an excellent spring vegetable. Pick off those shoots which are fresh and young; throw into cold water for an hour or more before cooking; have ready a kettle of boiling water; throw in a handful of salt and add the sprouts; they will cook in from twenty to thirty minutes. Eat with vinegar or prepare drawn butter and pour over.

Hot-Cross Buns.

Subscriber says: "Please give directions for hot-cross buns."

ANS.—Two pounds of flour; half a pound of sugar; a small quantity of grated nutmeg and allspice; stir together; make a hole in the center of the flour and pour in one-half pint of warm milk and one-half tea-cupful of good yeast; stir in enough of the surrounding flour to make a thin batter; cover and let stand before the fire until light; then add half a pound of melted butter; enough milk to make all of the flour into a soft dough and a little salt; dust over with flour and let rise for half an hour. Then make the dough into the shape of buns, notch out on each the form of the cross and lay them separately in rows on buttered tins to rise again for half an hour; put in a quick oven, watching them carefully, lest the color should be spoilt by overbaking.

Curry of Tongue.

A. L. M., says: "Please give recipe for a curry of tongue."

ANS.—Fry a dessert spoonful each of curry powder and flour in two tablespoonfuls of butter until brown; then add a pint of good beef stock; two onions chopped and fried brown in butter; two pounds of tongue cut into thin slices and the grated rind of a lemon; simmer for half an hour; add lemon juice and salt to taste.

To Stew Celery.

Mrs. T D. D., says: "I should like your recipe for stewing celery?"

ANS.—Remove the outer stalks and break off the green tops; cut into small pieces and boil in milk and water until very tender; thicken with a good lump of butter and flour; season with pepper and salt; then add the yelks of two well beaten eggs mixed with a teacupful of sweet cream; shake the sauce-pan over the fire until the gravy thickens, but do not let it boil.

OUR FREE SEED DISTRIBUTION.

SEEDS of the following varieties of plants are offered to our subscribers without any charge whatever (except for postage, a part of which we bear) until further notice:

DEFIANCE WHEAT. A hybrid spring wheat. The most promising variety ever before offered.

"PEARL," OR "EGYPTIAN" MILLET. One of the most promising fodder plants known.

BEAUTY OF HEBRON POTATO. According to many careful tests, this is ten days earlier than Early Rose, as good in quality, and more prolific.

THE VOORHIS WATERMELON. A specialty of the Rural Farm.

GOLDEN RURAL TOMATO. A specialty of the Rural Grounds.

ACME TOMATO. This is offered as the best of the newer varieties of Tomatoes to those who may prefer it to a trial of the Golden Rural.

NEW BRONZE RICINUS. Specialty of the Rural Grounds. The most beautiful Ricinus in cultivation. A cross between Ricinus Gibsonii and R. sanguineus.

HIBISCUS MOSCHEUTOS—the showy and beautiful Rose Mallow, never before offered so far as we know. Hardy.

CALLICARPA AMERICANA (Purpurea). The brilliant French Mulberry. Hardy.

HIBISCUS SYRIACUS. One of the most charming of hardy shrubs. Sometimes called "Rose of Sharon." Our seeds are saved from double-flowering varieties—many of them from seedling plants. They grow readily from seeds, and bloom as soon as plants would if transplanted from nurseries. The seedlings "sport" without end.

WEIGELA. Seeds saved mostly from seedlings. This is probably the finest hardy shrub in cultivation.

DEUTZIA CRENATA fl. pl. Seeds saved from seedlings at the Rural Grounds. Seventy-five per cent. of seedlings will bear double flowers. It is perfectly hardy and there is no finer shrub known for ornamental grounds.

HIBISCUS MILITARIS. Hardy and beautiful.

ERYNGIUM LEAVENWORTHII. The most striking annual of recent introduction. (See RURAL of November 9th for engraving of this and other plants, seeds of which we offer.)

GERANIUM SANGUINEUM. A true geranium of great beauty. Perfectly hardy.

YUCCA FILAMENTOSA. Every farmer and lover of plants should have specimens of this perfectly hardy evergreen liliaceous plant in his grounds. It is superb.

VITIS HETEROPHYLLA. See RURAL, Nov. 9, for description of this hardy vine.

RURAL HYBRID AQUILEGIAS. Beautiful, hardy perennials of great beauty.

GRINDELIA SQUARROSA. See RURAL of Nov. 9 for remarks.

OBSERVE.

Any ten of the above require a one-cent postage stamp:—that is, ONE *cent* for the ten, not for each except the Beauty of Hebron Potato, Pearl Millet and Defiance Wheat. The Beauty of Hebron requires a two-cent extra stamp and the other two a two-cent extra stamp also.

Other varieties *may be* added. We intend this free seed distribution to be the most valuable of its kind that has ever been gratuitously offered by any journal, and to introduce the above valuable plants to the homes of farmers and horticulturists in every part of our country.

WE offered, some time ago, to sell the cuts used in this Journal for twelve cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

For Coughs, Colds and Throat Disorders, use "*Brown's Bronchial Troches,*" having *proved* their efficacy by a test of many years. 25c. a b

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 18, 1879.

BEANS AND PEAS.—Prices for medium and marrow beans ruled low, but dealers think the decline checked, and choice grades are held with more confidence. Exporters are operating more freely in marrows, while a stronger potato market helps mediums for local use. White kidney quiet; Pea also, but with rather more stock looked at. Red kidney active and firmer, with each new wholesale transaction. Black beans unchanged. Green peas are in moderate supply, but the demand is limited at $1.30@1.32. Canadian field peas in bulk and bond 1c. higher, 73@75c.: Southern B. E. steady at $2.70@2.70. Medium beans, prime, $1.37@1.40; fair to good, $1.20@1.30; marrows, prime, free on ship, $1.40@1.45; fair to good, $1.25@1.35; pea, $1.40@1.55; white kidney, $1.70@1.90; red do., choice, $2.60@2.70; fair to good, $2.35@2.50; black beans, $2.05@2.25.

Receipts of beans for week, 3,020 bushels; exports, 600 bbls.

BEESWAX.—Small sales to the local trade at 26@27c. for Western and Southern.

BROOM CORN.—There are fair receipts and easy prices. Jobbing rates are 3¼@4@4¼ @5¼c. for inferior to choice. Car lots do not exceed 4½c. for very best, and off grades sold as low as 3c. One car very poor sold at 2c.

BUTTER.—There is rather more activity, but it does not run along the whole line of sellers. With butter, as with many other items of produce, there are too many sellers for the current volume of trade. As before, choice half tubs lead the call for State, and perhaps with the firmness in Western more sales of useful second quality State can be reported. Shippers have added some life to trade taking fair quantities of State, 13@15c. All in all, the month is favorably ahead of last in the distribution of under grades. An exchange correctly remarks that:—

"One of the most severe drags upon the market this winter is the collections of early made parts of dairies. Many of them are likely to go out disastrously for owners. Prominent dealers hope that the result will hasten what has been so frequently advocated, prompt shipments of fresh, carefully made stock. Holding in firkins for six months is a feature of the past, since creameries West and nearer steadily enlarge the supply of strictly fresh flavored butter."

Western butter is in good demand, showing good grain quality. Prices have been strained up rather high, and at the close are quoted full. Rolls higher with improved quality.

State, full dairies, special, 20c.; other, 16@19c.; firkin dairies, fair to prime, 15@18c.; Welsh dairies, fine full, 16@17c.; choice half tubs, 23@25c.; fair to prime do., 16@21c.; choice Welsh, 19@20c.; fair to prime, 12@17c. Choice creamery 24@25c.; best western creamery, 31@32c.; other, 24@30c.; early packed creamery, 17@20c.; poor State, 5@12c.; Western dairy, fine fresh, 18@20c.; fair to good, 10@15c.; factory, ladle packed, 17@18½c.; good, 14@15c.; other, 6@8c.; rolls, 10@16c.; grease, 4@5c.

Receipts for week, 27,711 pkgs.; exports, 8,860 do.

CIDER JELLY.—Eastern enterprise has found a way to utilize surplus apple crops. Vermont is sending in quantities a delicious addition to table supplies called apple jelly. If its present pure quality is kept up the item will find a steady place here; quoted 8c. lb. with free sales.

COTTON—Has been variable and active, closing firm at for January, 9.44@9.46c.; February, 9.54@9.55c.; March, 9.74@9.75c.; April, 9.91c.; May, 10.01@10.05c.; June, 10.14@10.16c.; July, 10.24@10.26c.; August, 10.32@10.35c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

Good ordinary	7 11-16	Low Middling	8 11-16
Strict good ordinary	8 3-16	Middling	9 1-16

CHEESE.—The exports for the week have been 22,300 boxes; all grades have had more inquiry the past week, and the situation of the market is rather steadier, with choice factories especially firmly held. Quoted at 9@9½c. for strictly fancy; 8¼@8½c. for fine lots; 7¼@8c. for good; 4@5c. for skimmed; State, farm dairy at 8@8¼c. for fine; 7@7½c. for good to prime, Wisconsin factory, fine, 8¼@8½c.; some fancy lots to 9c.; do. good to prime, 7½@8¼c. Western factory, fine and fancy 7½@8¼c.; good and prime, 6@7c.; do. full skimmed, 2@5c.

Receipts for week, 12,076 boxes.

Liverpool cable 45s.

Steam to Liverpool, 35@37s.6d.

DRIED FRUITS.—There has been a slow trade in all articles the past week, and prices are unsettled. Southern plums at 13¼@14c.; State plums, 14½@15c.; Blackberries are quoted at 5@5¼c. Peaches—Peeled Georgia, at 6@7c. for poor; 8@9c. for fair to good; 10@10½c. for prime; choice North Carolina, 11½@12¼c.; good do., 8@10c.; unpeeled halves, 3@3¼c.; quarters, 3@3¼c. Pitted cherries, 20@22c. Apples—New, 2@2¼c. for southern quarters in bags.; 3¼@3½c. for good and prime sliced; do., fair at 2¾@3c. State at 3@3½c. for new sliced; and 3@3½c. for quarters; western at 2¾@3¼c. for new quarters. Raspberries, 27@29c.

Exports, past week, 1,219 bbls. apples.

FRESH FRUITS.—Apple dealers begin to withhold choicest marks of red and greenings in view of a better future. Good useful stock is selling at $1.50@1.87. No serious damage reported from stored lots during the severe frost. Spitzenburgs, choice, $2@2.37, bbl.; other $1.25@1.75; Baldwins, $1.50@2; Greenings and Spy and good sweet, $1.25@1.75; very common, 75c.@$1. Exports, 4,502 bbls. Cranberries are rather neglected at the prices, but holders will not yield for the present. Fancy Cape Cod, bbl., $9; good, $8 50; other, $5@8. Specimen marks of grapes, Catawba, 6@7½c. Few prime Fla. oranges of late receipts show considerable rust, and for such packages, either bbls. or boxes, prices are irregular. Extra high colored stem-cut, $5 half bbl. box; other, $2@4; bbls., $4 50@8. Peanuts scarcer; many lots detained by ice in Virginia rivers. Stock here large enough to supply all parts; hand-picked Va. best, $1.05@1.10; other 80@95c.; shelled, 4@5c. Hickory nuts dull at $2@2.50 for shellbarks; Pecans, 8@10c.

EGGS.—About last week's prices have ruled fairly firm. Local wants are light at the prices, and the main support of rates has come from outside orders. Limed eggs have advanced. Near points, 28 29c.; State and Penn., 27@28c.; Western and Southern fresh, 27@27½c.; Canadian, 24@25c.; poor Western, 2 @26c.; choice limed, 20@21c.; good to prime; 18@20c.; interior, 16@17c

Receipts for the week, 3,575 bbls.; do. last week, 2,856 do.

FLOUR.—There has not been much activity this week, but as receipts have been hindered by the storms prices have been well sustained.

Latest prices are at $3.15@3.60 for inferior to strictly choice superfine State; $3.60@3.90 for very poor to good extra do., odd lots and lines; $3.90@4.25 for good to very choice do., and fancy lots above this; $3.10@3.60 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.60@3.90 for inferior to good shipping extra do. and $3.90@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.70@5.00; choice to fancy do. at $5.00@5.75; red and amber winter wheat, very inferior to very choice trade and family $3.20@5.60; round hoop Ohios at $3.85@4.25, and trade and family brands of do. at $4.25@5.60, the latter rate for very choice; St. Louis, $4.00@4.75 for very poor to good extra, and $4.75@5.50 for good to choice; Minnesota clear, very inferior to fancy, at $3.00@5.00; few brands going above $4.50; Minnesota "straight," inferior to fancy at $4.40@5.00; and patent fair to strictly fancy at $5.25@8.25, few brands going above $7.50; unsound stock at from $2.00@4.75; city mill extra at $4.65@5.00 for West Indies (the latter rate for fancy in new packages); do. for England $3.65@3.90; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.50 for fair to very choice; No. 2 at $2.40@3.00 for poor to very fancy.

FURS AND SKINS.—A good feature of the trade is the firmness of common skins. Skunk and winter muskrat are doing better.

	Nor. & East.	West & N. W.

Southern furs usually sell 15 to 20 per cent. below western.

GRAIN.—Wheat has been held up partly by small receipts, as the export demand has been moderate. Latest sales are of Nebraska spring at $1; No. 3 Chicago spring at 93@98c.; rejected spring at 75@78c.; ungraded amber at $1.07@1.11; No. 2 amber at $1.06@1.07¼; rejected red at 99c.; ungraded red at $1.07@1.11; No. 1 red at $1.10¾@1.10¾; No. 2 red at $1.09¾@1.10; No. 3 red at $1.03¾@1.04; white State at $1.11¾@1.13¾; No. 1 white, at $1.10¾@1.11; No. 2 white at $1.08¾@1.08¾; ungraded white at $1.09@1.11¾; No. 2 amber, January option, at $1.07; do., February option, at 1.07¾; No. 2 red, January option, at $1.10; do. February option, at $1.10; do., March option, at $1.11. Rye at 55@56c. for State. Corn is fairly active and steady; sales of steamer mixed, in lots, at 45¾@45¾c.; New York No. 2 at 46¾@47¾c.; New York No. 3 at 45½c.; ungraded mixed at 47@48c.; New York No. 2 new at 46½c.; Jersey yellow at 45@47¼c.; round yellow at 47c. for a car lot; No. 2 white at 48c.; New York steamer white at 45c.; No. 2, January option, at 47¾c.; do., February option, at 45¾@45¾c.; do. March, at 46c.; new No. 2 January option, at 46c.; steamer mixed, January option, at 45¾c.; do., February option, at 44¾@44¾c. Oats are in light receipt and strong in price; sales of New York No. 1 at 31½c.; New York No. 2 at 31½c.; New York No 2 white at 34¾c.; New York No. 3 at 30@30¾c.; New York No. 3 white at 33@33½c.; white Western at 33@35½c.; mixed do. at 30¾@31¾c.; white State at 34@36c.; mixed do. at 32½c.; New York extra white quoted at 38½c.; New York No. 1 white at 35¾c., delivered; No. 2 Chicago, afloat, at 31¾@31¾c. Barley, State 6-rowed, 93c.@$1; do, 2 do., 78@83c.; Canadian, $1.10@1.25; malt, 95c.@$1.25.

HAY AND STRAW.—The local demand is fair, and as receipts run moderate prices are sustained.

Sales at 40@45c. for shipping, and 70@80c. for retail qualities. Straw quoted at 50@55c. for long rye, and 35@45c. for short rye, and oat at 40@45c.

Exports, for week, 1,300 bales.

HONEY.—It looks as though much would have to be carried over if present low rates do not move it. Clover, single comb, 10@12c.; two do., 8@10c.; buckwheat, 7@9c.; strained, 6@10c.

HOPS.—Shipments this week have been only 742 bales. Holders display confidence at current prices, notwithstanding present demands are moderate.

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 10@13; New Yorks, new crop, low to fair, 7@9; Eastern, 8@13; Western, 8@13; Yearlings, 4@6; Olds, all growths, 2@3; Pacific coast, 12@15.

SEEDS.—Clover is in full receipt and easier; quoted 6¾@6¾c. for western, and 7¼@7¾c. for State; timothy at $1.25@1.30. Flaxseed at $1.42½.

OIL CAKE.—Has sold at $27 for Western.

PROVISIONS.—Have advanced on partly a sharp speculative demand.

Mess pork at the close quoted at $7.65 bid and $7 65 asked for old for January; $9 bid and $9.25 asked for new for January; $7.55 bid and $7.90 asked for old for February; $9.10 bid and $9.60 asked for new for February; $7.60 bid and $7.75 asked for old for March; and $9.15 bid and $9.30 asked for new for March; and $9 20 bid and $9.30 asked for new for April; and May at $9.30 bid and $9.40 asked. Bacon at 4¾c. for long clear and 4¾@4¾c. for short clear. Lard, western steam, at $6.20 for spot lots; $6.15@6.17½ for January; $6.17½ for February; $6.25 for March, and $6.30 for April. Stearine at 6¾@6¾ for Western and 6¼ for city. Beef hams at $14.50@14.75. Beef, extra India mess, $21 for city brands; do. Philadelphia, $18.50@19; packet at $11@11.50; plain mess at $10@10.50; extra mess at $10.50@11.50. Tallow at 6¾ for prime.

POULTRY AND GAME.—Owing to scant supply only prices are stronger. Western chickens, 6@7c.; State and N. J., 7@8c.; roosters, 4@5c.; fowls, 8@9c.; turkeys, hen, 9@10c.; toms, 7@8c.; ducks, choice, 60@67c.; Western and Southern, 45@55c.; geese, N. J., $1.50@1.62; Western, 75c.@$1.12; pigeons, 25@30c.

There is a wide range of prices for dressed. Much of the supply is frozen, but the demand is good as prices are cheap and there has been no variable temperature to damage quality. Western dry-picked turkeys are unusually plenty and easy; prices check firmness for near-by. Ducks and geese dull. The main demand is for good chickens and small turkeys.

Phila., dry-picked turkeys, 12@13½c.; fresh New Jersey, 11½@13c.; selected Western, 11@12c.; other, 8@10c.; Phila. fowls, 10@12c.; do. chicks, 13@15c.; near-by fresh, 11@12½c.; other, including frozen, 5@10c.; Capons, 13@20c.; slips, 16@18c.; Ducks, 9@13c.; Geese, 5@8c.

Heavy supplies of quail still make the feature of the game market, and prices are so low that other items are weakened thereby. Wild ducks are not of attractive quality. Grouse abundant.

Quail, ₰ doz., 50@70c.; Grouse, trapped, ₰ pair, 60@85c; drawn, 50@55c.; Partridges, ₰ pair, 60@80c.; Canvas-back Ducks, $1.25@1.50; Red-head, 75c.; Mallard, 50@60c.; Black and Teal, 35@40c.; common, including Broad-bills, 20@25c.; Hares, 15@20c.; Rabbits, 10@15c.; Wild Turkeys scarce.

TOBACCO.—Trade has been quiet the past week, but prices have been well sustained. Quotations are for

Iowa, Vermont and Illinois—X and XX, 28@31c.; No. 1, 32@34c.; No. 2, 27@29c.; combing, 33@36c.

Missouri, Kentucky and Tennessee—Washed fleece, 26@31c.; unwashed fleece, 21@26c.; unwashed combing, 25@27c.

LIVE STOCK MARKETS

Saturday, Jan. 18, 1879.

BEEVES.—Receipts small. There has been a strong attempt to advance prices under plea of prospective scarcity, blocked roads and other winter excuses. It has not been met, however, as wholesalers know their average wants pretty well, and many have taken advantage of the line holding weather and have kept a supply of dressed ahead in the slaughter-houses. The range at the close is 8¼@10c. dress 55@56 lbs.; numerous sales at 9@9¼c.; bulls, $2.70@3.20 per 100.

COWS AND CALVES.—Our former range of $35@75 per head is the nominal one. No demand.

VEAL CALVES.—Choice live obtain a larger share of trade than they would if dressed were not arriving so generally frozen. Choice N. J. and Buck's Co., live, 7@7¼c.; do., State, 7c. other, including 200@300 lb. calves, 5¾@6¾c.; fed, 4@5c.; grassers, 2½@3c. Hog dressed, in a small way, 9¼c.; general range, 6@9c.

SHEEP AND LAMBS.—Receipts for the week, 17,255 head; do. last week, 15,921 do. Sheep have sold very steadily at very fair prices compared with other stock. Western, fair to prime, 4¾@5¾c.; extra, 5¾@6c.; near-by, 4¼@5c.; ewes, 4c. Lambs, 5@6¾c.

SWINE.—Receipts for the week, 36,197 head; do., last week, 23,920 do. Few live arriving; nominal rate, 3¾@3¾c.

Country dressed pork continues easy, especially for heavy weights. Extra light pigs, 5½c.; ordinary light, 5c.; medium, 4¾@4¾c.; heavy, 4c.; city, 4@4¾c.; Western dressed, 4@4¼c.

ADVERTISING RATES:

THOROUGHBRED ESSEX PIGS.—For sale: Sows of 75 to 150 lbs. each, in pig by my best Boar (Harris' No. 523), at $5 each, adding 5 cents per lb., according to weight wanted. Also, some Sow—or Boar—Pigs, fit to breed, averaging 50 lbs., at same rates. Address OTTO ERNST, Clay Mines, South Amboy, N. J.

My Annual Catalogue of Vegetable and Flower Seed for **1879,** rich in engravings, from original photographs, will be sent FREE, to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. *Printed directions for cultivation on each package.* All seed *warranted to be both fresh and true to name;* so far, that should it prove otherwise, *I will refill the order gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables, I invite the patronage of *all who are anxious to have their seed direct from the grower: fresh, true, and of the very best strain.*

NEW VEGETABLES A SPECIALTY.
JAMES J. H. GREGORY, Marblehead, Mass.

HORSFORD'S
Bread
Preparation

UNSURPASSED FOR MAKING

LIGHT BREAD

Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof. E. N. Horsford, by the Rumford Chemical Works Providence R. I.

A GREAT OFFER FOR

SPLENDID ORGANS 2 3-5 sets of reeds $65, 3 sets with Sub Bass and Coupler $80, 2 sets $50, 1 set $40, 1 set $35. 7 Octave *all* ROSEWOOD PIANOS $130, 7 1-3 do $140, warranted for SIX years. AGENTS WANTED. Illustrated Catalogues Mailed. Music at half price, HORACE WATERS & SONS, Manfrs. *and* Dealers, 40 E. 14th., St., N.Y.

Reading for the Young.

THE FOREIGNER AGAIN.

DEAR RURAL COUSINS:—In the first place, I wish you all a happy and joyful New Year, and hope that you will now make your appearance in the columns of the dear old RURAL with renewed zeal and strength! The Editors of this unsurpassed household and farming paper have done their best to raise the RURAL to the highest summit of usefulness; now, dear cousins, let us sustain them in their endeavor by contributing what little wisdom and experience we may have. Let us all march up to the front armed with knowledge, wit and humor, and commence the battle at once, not a battle for life or death—we let the older folks do that kind of fighting—but one for space in the RURAL for our letters.

I suppose you will be astonished to see this letter dated from Clinton County, N. Y., instead of from Switzerland, Europe. I did intend to go abroad, but have changed my mind and concluded to prolong my stay in America indefinitely. I have now become accustomed to the climate and customs of this country, and I like the people that live in it so well, that I really would prefer to make it my future home. To be sure, Switzerland is also a very nice country. Having a republican form of government much resembling that of the United States, people enjoy almost as much liberty there as we do here. All the fault I can find with my living there, is that the country is too small for me. The farming population have to live too crowded, which sometimes produces very disagreeable consequences. During the time I have lived on this hemisphere, I have learned to appreciate the habits and manners of your people so much, that it makes me shiver every time I think back on the rural life in Switzerland. There people do all their work without machinery, and live on such a coarse diet—boiled pork and potatoes the whole year round, and sometimes they don't even get that. They have to work about one-fifth of the whole year in the grape-vine fields, just to get wine enough to satisfy their always dry throats. Wine is thought so much of that without it, it would be impossible for the farmer to get any hired help, not even if he would offer them double wages.

In Switzerland, a farmer would think it extravagant and foolish to keep a horse and wagon for the purpose of riding out; he always walks. If he has any produce as butter, eggs, etc., to spare, he tells his wife or daughter to put the same in a basket and go to the city to sell it, sometimes a walk of over ten miles. Of course, the poor women acknowledge the superiority of the men, and without grumbling they place the basket (containing, perhaps, thirty or more pounds of farm produce) on the head, and sometimes another on the arm, and march to the city laden down like camels. It seems very cruel and hard indeed, to have the women of my country do such hard work, but it is the custom and they don't complain. On the contrary, they seem to enjoy that kind of life and remain very healthy, in spite of their hard work.

I am pretty sure, that if Heliotrope had lived there only one month with an old, stylish farmer's family, she would not think that the "boys are really nice animals," as she calls them in her letter. I rather think that if she would try to live there in American style, the boys would quickly turn her out; she would then most likely call them *horrid* animals.

To spend this winter in a useful and agreeable manner, I took up the studies of anatomy, physiology and chemistry, and I find them to be very interesting and benefitting studies, even for the farmer. They give so much useful information about the constitution and organization of living beings, and the phenomena which are presented by life. The chemistry furnishes us with the most direct and certain means of ascertaining what a barren soil wants to make it fruitful, and also what ingredients are required to adapt it to any kind of produce. I am also trying to make a collection of Indian relics, arrow-heads, stone-axes, etc., but they seem to be very scarce in this locality.

But I fear I have exhausted UNCLE TRUE'S, as well as your patience. I will therefore close this long letter, wishing you once more a happy New Year, full of joy, usefulness and pleasure, and hoping that we all may appreciate the value of our young years, in which we must lay the foundation for our future. My motto shall be: "Never be idle, and when you work, do it with a design of usefulness." *Au revoir donc, mon cher Oncle et mes chers cousins!* JOHN SCHWYN.

Clinton Co., N. Y.

NUMBER TWELVE.

MARY B. LEE.

NUMBER twelve plays an important part in the Bible, in history, and in arithmetic, as well as in every-day life and business.

What so common as a dozen handkerchiefs or napkins, or whatever the article may be? It comes natural to think of various articles in dozens. Of course, dozen is another way of saying twelve; twelve units make one dozen, twelve dozen one gross, twelve gross one great gross.

Then, although the moon travels round the earth thirteen times in one year, making thirteen lunar months, the year is divided into twelve calender months and the sun appears to pass through one constellation each month. So we have the twelve constellations of the ecliptic or zodiac, or twelve signs in a circle.

Then we have twelve pence in a shilling, English money, which has only gone out of use in this country of late years. We used to hear of shillings and pennies, and buy goods at a shilling or two shillings a yard as if we lived under the British flag.

We have also twelve inches in a foot; twelve ounces in a pound Troy and apothecaries' weight. Twelve is the least common denominator of several numbers, halves, thirds, fourths, sixths and twelfths—so that it is very much used in working fractions.

From Jacob's twelve sons came the twelve tribes of Israel, about which so much has been written.

Our Lord chose twelve disciples to establish his church, and the number must have been considered important, because Matthias was chosen to take the place of Judas. In the Revelation of St. John we read of the number of them which were sealed—twelve thousand from each tribe, making 144,000 from all the tribes of Israel.

In the description of the heavenly Jerusalem, we read that the wall had twelve gates, and at the gates twelve angels, and names written thereon, which are the names of the twelve tribes of the children of Israel. And the wall of the city had twelve foundations, and in them the names of the twelve apostles. The measure of the city was twelve thousand furlongs. The tree of life is represented as bearing twelve manner of fruits, and yielding her fruit every month. In the Bible, then, twelve is an important number.

Long ago, in England, a woman had several husbands in succession till suspicion was excited, and a man married her on purpose to unravel the mystery. He watched closely till one night, while he pretended to be asleep, she melted some lead and came over to pour it into his ear, when he sprang up and prevented her from adding him to her list of departed husbands.

An investigation was commenced. Twelve men were chosen to look into the matter. The bodies of the buried husbands were taken up and examined. She had poured lead into their ears, and the metal was found in their heads. Of course the twelve men decided that she had killed them all. That was the first trial by jury. Ever since when a crime has been committed and some one is suspected and arrested, he is tried before *twelve* of his fellow countrymen, and they decide upon his guilt or innocence. So twelve figures in every trial, and no one is condemned to prison or death except by a verdict from twelve of his countrymen.

So we find twelve an interesting number in many ways.—*Demorest's Monthly*

SOCIAL LIONS.

A NATIVE of Ukaranga asserted that in the village next to that in which he lived the people were on most friendly terms with the lions, which used to walk in and about the village without attempting to injure any one. On great occasions they were treated to honey, goats, sheep, and ugali, and sometimes at these afternoon drums as many as two hundred lions assembled. Each lion was known to the people by name, and to these they responded when called. And when one died the inhabitants of the village mourned for him as for one of themselves. This village was reported to be situated on the shores of Lake Tanganyika, not very distant from Jumah Merikani's house; and he also told me that the friendship between the natives and the lions was commonly spoken of, but he had never been present at one of the gatherings. The Mananga, however, asserted that he had often witnessed this friendly intercourse between man and beast, and brought several of his tribesmen to testify to the truth of his statement. Certainly, if this be true, our most famous lion-tamers have yet something to learn from the natives of Africa.—*Across Africa.*

WHY HE WAS THERE.

AN illustration of the conservatism which formerly pervaded the Russian army is given in the following anecdote told by Bismarck:

One day I was walking with the Emperor of Russia in the Summer Garden of St. Petersburg, when, coming upon a sentinel in the center of a lawn, I took the liberty of inquiring why the man was placed there. The Emperor did not know; the adjutant did not know; the sentinel did not know, except that he had been ordered there.

The adjutant was then dispatched to ask the officer of the watch, whose reply tallied with the sentinel's—"Ordered." Curiosity awakened, military records were searched without yielding any satisfactory solution.

At last an old serving-man was routed out, who remembered hearing his father relate that the Empress Catherine II., one hundred years ago, had found a snowdrop on that particular spot, and given orders to protect it from being plucked. No other device could be thought of than guarding it by a sentinel. The order once issued was left in force for a century.—*Youth's Companion.*

THE TEN QUESTIONS.

THOUGH it is pleasing to see that the Cousins have been so interested in my questions, and answered them very fully, as a general thing, I am sorry that so many have not been more prompt with their answers. I am receiving answers now by the half hundred, which ought to have been here a week ago, and, of course, are entirely too late. Many, no doubt, are excusable, as the mails have been delayed in several parts of the country on account of the heavy snow-storms; but others have spent too much time in making up their minds, and consequently have lost their chance for competition. I am sure, however, they will be more prompt another time. UNCLE TRUE.

LETTERS FROM BOYS AND GIRLS.

Some New Cousins.

DEAR UNCLE TRUE:—I suppose you will call us the new cousins, for pa has just commenced taking your paper, and I hope you will be our uncle too. I heard grandma read Lilly Lee's letter, and she said she wished the girl cousins would tell her in Uncle True's paper what they received for Christmas presents, and how they made those they bestowed on others. I will tell you first who we are. My name is Katie Mills, and I was five years old last Thanksgiving. My little sister's name is Fannie. She was a holiday present, and was three years old after Christmas. We got a good many Christmas presents. Grandma gave us each a new slate, so we can write and make pictures. She gave us also a book and a box of handkerchiefs each. Papa gave us some picture books and silver spoons, and I got a writing-desk besides. Mamma remembered us by giving us something to keep us warm, and she also gave me a testament. Besides this we got some dolls from the Sabbath school Christmas-tree. I am afraid there are some little girls who didn't get any Christmas presents. We ought to be *real good* little girls, when God is so good to us. Now, Uncle True, I don't know as you will think my letter good for anything, but I am going to send it. KATIE AND FANNIE MILLS.

Livingston Co., N. Y., Jan. 11, 1879.

DEAR UNCLE TRUE AND COUSINS:—I am another relative and hope I may come into your circle; my father has taken the RURAL for a number of years, and I like it very much. I am eleven years old and live about eight miles above Binghampton. I do not go to school this winter, for I have to stay at home and help mother do the work. I guess I will not write more at present, but if this is published I will try to do better another time. Yours truly,

Binghampton, Jan. 11, 1879. CLARA MEAHER.

[You are all welcome. Next time I hope Clara will not forget to tell us in what state she lives; there are several Binghamptons in the United States.—EDS.]

The Puzzler.

DECAPITATIONS.

1. DECAPITATE a city of Germany, and leave a city of Arabia.
2. A city of Spain, and leave a field.
3. Mountains of Cape Colony, and leave the present time.
4. An island near Niphon, and leave turmoil.
5. A city of Arabia, and leave a cave.
6. Part of Arabia, and leave God's best work.
7. A Persian plateau, and leave a verb which means scampered.
8. A city of Siberia, and leave a jewel.
9. A city of India, and leave a city of Italy.
10. An isthmus of the Bay of Bengal, and leave uncooked.
11. A cape of Australia, and leave in debt.
12. A bay of Australia, and leave to listen.
13. One of the Sunda Isles, and leave a city of India.
14. One of the Hebrides, and leave a lady's name.
15. An island of Oceanica, and leave tools.
16. A town on the Isle of Man, and leave a fish.
17. A town of Ireland, and leave a pronoun.
18. A town of Ireland, and leave the edge.
19. A lake of Ireland, and leave to question.
20. One of the Channel Isles, and leave a vessel of old.
21. An isle of Scotland, and leave to kill.
22. A lake of Scotland, and leave a pronoun.
23. One of the Shetland Isles, and leave a measure.
24. A city of England, and leave a lady's name.

☞ Answer in two weeks. BALTO.

HIDDEN NOVELS BY BULWER.

1. Oui, la reln, zillah.
2. He forbade Amy novel-reading.
3. I saw Feuge near a mine.
4. Will he disown Edward?
5. According to the gospel Ham was branded.
6. The east rang Estory's doom.
7. These are the last days of pomp, Eligura.
8. 'Tis the hour when night and morning meet.
9. Ravers are brewers. On Lucerne St. malt ravers dwell.
10. Do not brag, Nestora!
11. Pat said, "Misther Thec! ax Tonsy."
12. Do search, Paul; cliff or down upon the strand.
13. It is Thepil Grims of ——, the Rhine wine inspector.
14. Adelaide Veroux is here.

☞ Answer in two weeks. DR.

CROSS-WORD ENIGMA.

My first is in April but not in May,
My second is in night but not in day;
My third is in dumb but not in mute,
My fourth is in harp but not in lute;
My fifth is in wooed but not in won,
My sixth is in moon but not in sun;
My seventh is in wood but not in fuel,
My eighth is in light but not in duel;
My ninth is in name but not in Morgan,
My whole is in splendid organ.

☞ Answer in two weeks. LIDA.

THE NEW COMMANDMENT.

"A NEW commandment I give unto you, that ye love one another; as I have loved you, that ye also love one another." In His last interview with His disciples, before He suffered, Christ spake very tenderly on this point, and He accompanied His words with the prayer that they might all be one; and it was a prominent theme in the Epistles of the Apostles, and especially so in those of John, the disciple whom Jesus loved.

There are important reasons why the disciples of Jesus should love one another. They are all disciples of the same loving Saviour. They are all members of the same family, of which Christ is the Head. They are all born of the same Spirit. They have the same great object for which to live—the promotion of the kingdom of the Redeemer. They have similar joys and sorrows. They are all traveling on together to the same blessed home in Heaven, where they will forever dwell, and unite in the same rapturous songs, and participate in the same delightful pleasures.

They owe it to their Savior, who bought them with His own precious blood, that they love one another. Nothing will please Him better; nothing will honor His religion more, and tend so much to its advancement in the world. "By this," He said, "shall all men know that ye are my disciples, if ye have love one to another." Thus should His religion be advanced, and men be led to think and to speak well of it.

But, on the other hand, nothing so much brings dishonor upon religion, and hinders its progress, as the want of brotherly love, and a spirit of animosity on the part of the professed friends of Christ. Whenever such is the case, the enemies of religion take notice of it, and make the worst of it. They eat the sins of the disciples of Christ as they eat bread. They make them an excuse for the neglect of religion, and soul-destroying is the effect upon them. Next to more love to Christ, more love to His people should be striven for.

"Love is the golden chain that binds
The happy souls above,—
And he's an heir of heaven who finds
His bosom glow with love." H. S.

["*Observer.*"

CHEERFULNESS.

As therefore Jesus said to his disciples in the storm, "Be of good cheer," so say I to you. Be of good cheer always and everywhere, in your darkest nights and deepest griefs, and in the wildest winter weather. When the United States fleet stood off the coast of North Carolina, the water was troubled and exceedingly tossed, by reason of a great wind that blew, and it was night; but as the waves rose in their rage, they became phosphorescent, and changed the stormy sea into a sea of glory; so your brightest joys should leap up out of the very sorrows of your souls.

The bird that soars the highest builds her nest upon the ground; and the bird that sings the sweetest sings in the night; and when we are sinking down in the dark depths, by the grace of God, we may rise above them and soar away, higher than the skylark, up into the brightest shining of the sun of righteousness, singing, as we soar, sweeter than the nightingale. Although the fig-tree shall not blossom, neither shall fruit be in the vines; the labor of the olive shall fail, and the fields shall yield no meat; the flock shall be cut off from the fold, and there shall be no herd in the stalls; yet I will rejoice in the Lord, I will joy in the God of my salvation. The Lord God is my strength, and he will make my feet like hinds' feet, and he will make me to walk upon mine high places (Hab. iii. 17-19).—*Alexander Dickson in "Beauty for Ashes."*

COMPROMISING WITH CONSCIENCE.

A GOOD many people are inclined to settle the question of public amusements by a cowardly compromise with conscience. They wish to be considered opponents of theatrical exhibitions, and so they draw the line in favor of minstrel shows, where most likely, a company of vulgar comedians retail all the questionable jests of the season. Or, again, they consider their pledges as church-members violated by a visit to a circus, but deem opera-going an innocent and commendable practice. Now, whatever position be taken concerning play-houses, it is plainly the Christian's duty to look sharply at the moral quality of the average opera. One of the most famous of modern operas is devoted to the exploits of a fallen woman of the worst class. Last week three thousand Philadelphians crowded the Academy of Music to listen to the first recital of the story of another woman of the same sort. Is a tale of vice not the less dangerous when surrounded by all the allurements of the musical art? Plainly, there is a gross inconsistency in that choice which rejects the theater merely because it is a play-house, and accepts a lewd opera because it is a musical performance. It is useless to banish the corrupt old English dramatist from our libraries, so long as the music of equally corrupt modern Italian composers lies on the piano. It is not yet time to forget the good example of that American singer who refused, a few years ago, to enact the part of an abandoned character, and lost her professional engagement in consequence.—*Sunday-school Times.*

WE wish it to be distinctly understood that we do not endorse all the religious ideas published in this column. Our object is to give matter which will stimulate our readers to study questions of conscience and conduct for themselves.—EDS.

As all lights cannot make up the want of the light of the sun, so all temporal comforts can not make up the want of one spiritual comfort.

PERSONAL ITEMS.

The marriage of the Duke of Connaught will be solemnized at Windsor Castle about the 13th of March, the ceremony, originally fixed for February, having been postponed a month in consequence of the death of the Grand Duchess of Hesse. There is ample time therefore for any of our readers who may have been invited to the wedding, to pack up their carpet-bags and pick their steamers.

Lida Smith chewed gum in Louisville until her jaws kept moving in spite of her efforts to stop them. She took the gum out of her mouth, but her jaws continued to open and shut, with a violence that contorted the whole of her face. A physician applied bandages, but it was only by making her insensible with chloroform that she was quieted. It was a case of spasmodic action of the facial muscles from over exertion.

Rugby School, England, which in these latter days has come to be regarded as a model, was quite the reverse in the last century The boys were hardly treated and half imprisoned, and their only playground was the churchyard. A grim tower is still pointed out as the torture chamber of a former master, Dr. Wool, whose diminutive stature but severe stripes probably suggested the saying: "Much cry and little Wool."

Mr. Westwood, of Mount Auburn, Ohio, was worth $65,000 when his first wife died. Her industry and management had been to a great extent the cause of his prosperity, and he gratefully spent $1,400 in putting a monument over her grave. He soon married again, and his second wife rapidly wasted his fortune until he had no property left except the monument. According to the new Mrs. Westwood's advice, he had it removed to a marble yard, effaced the inscription, and offered it for sale at half its original cost.

Dr. McBride, who called himself King of Pain, died in Chicago a few days ago of consumption. He was an educated physician, it is said, but preferred a roving life and the methods of a quack. He traveled in a gaudily painted wagon, and was known from Maine to Mexico. He was tall and thin, his hair was never cut, and a dress like that of a Western scout gave him a picturesque aspect. Thousands believed his pretentions of almost miraculous curative powers and he did a profitable business; but he spent money freely, and died poor.

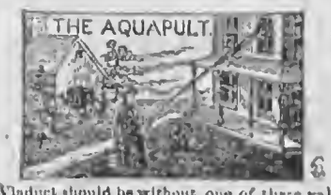
William Blair, of Boston, received a bequest of $25,000. He had been poor, and the sudden acquisition of wealth rather turned his head. He began to spend the money in reckless dissipation, in spite of the efforts of his father to restrain him, and kept on until only $11,000 were left. The father begged that this remainder might be given to him for safe-keeping, and the son, being then ill from long drunkenness, and very penitent, readily complied. The father put $10,950 into a pocket in his shirt, and started out to spend the other $50 in a frolic. That night he slept on a bench in a barroom, and in the morning every cent of the money was gone.

Ex-Judge Seney is one of the foremost men in Tiffin, Ohio. His wife and Anna Walker were for a long time intimate friends, going together to social gatherings and church meetings, and being very much alike in their love for Mr. Seney, as the wife eventually found out. A divorce suit was the consequence, Mrs. Seney, obtaining a decree in her favor and an award of $20,000. Subsequently Mr. Seney married Miss Walker, which so exasperated the divorced wife that she struck the new wife in the street. The latest move in the controversy is a suit by Mrs. Seney No. 1 against Mrs. Seney No 2 for damages in winning the love of the ex-Judge.

Johnny Chamberlin committed suicide in Magalia, Cal., because the civilization of the place had left him discouragingly far behind. Chamberlin went there in the early mining days, when Magalia was called Dogtown. He was a scholarly man, and had qualities of recklessness and good-fellowship that made him very popular. Coot's saloon was the popular resort. Chamberlin bet with Coot $5,000 on Lincoln against the saloon on Douglass. Thus winning the establishment, as truthfully related in one of Bret Harte's stories, he stuck to it until his death, two weeks ago. In the meantime Dogtown became Magalia, churches and schools were established, and public sentiment changed so completely that gambling and drunkenness—Chamberlin's strong points—came to be regarded as disreputable. So he shot himself.

George Meeks was sick abed at Boone's Landing, Ky., when the recent very cold weather began. There was hardly any food in the house, and it became necessary for Mrs. Meeks to go to a store several miles distant for provisions. She started out on foot. The snow was deep and the cold intense. The husband became alarmed when she did not return within a reasonable time, and went to search for her, notwithstanding his illness. He found her frozen to death not far from home, with a bag full of flour beside her. Another sad death by the cold was that of a negro woman near Evansville, Ind. She was very old—over a hundred, according to her own belief. She lived alone in a miserable cabin. In an effort to keep warm she piled a large quantity of light, dry wood in the fireplace, and the flames spread to the hut. She was slightly burned in escaping, and then she froze to death.

Implements and Machinery.



"THE AQUAPULT," a new and greatly improved Fire-Extinguisher, Garden Engine, Window and Carriage Washer, Tree, Vine, and Shrub Protector from Insects, etc., for starting Aqueducts, and various uses which readily suggest themselves. Price, $9.00 each, sent by express, C.O.D. Manufactured by W. & B. DOUGLAS, Middletown, Ct., the oldest and most extensive manufacturers of Pumps in the world. Branch Warehouses, 85 and 87 John St., New York; 197 Lake St., Chicago, Ill.

New Publications.

AN ORIGINAL NOVEL.

"AS IT MAY HAPPEN"

A STORY OF

American Life and Character.

12mo. Extra Cloth. $1.50.

The following are brief extracts from letters of Critics who have read advance copies of "As It May Happen."

Dr. R. Shelton Mackenzie says:

"It is a story truly original in design and successful in execution. The dialogue is natural all through. There is infinite variety of action, some humor, and a great deal of mystery. The author displays great power and skill in constructing and telling a story, the interest of which never flags."

A Prominent Man writes:

"Nothing has interested me so much for many a long day as this story. It is admirably written, and is entirely original in its plot and development. Its humor, especially in its portrayal of Irish character, is simply inimitable, and its pathos is most natural and effective."

Opinion of a Distinguished Clergyman:

"It will excite unusual interest, and find a rare degree of favor with all lovers of pure fiction. It is decidedly a 'wholesome' story. Its wonderful interest depends on nothing questionable in matter or method."

From a Brilliant Litterateur:

"I pronounce it the best American novel that has appeared for years. Most of its characters are strikingly original."

Wit and Humor.

HIS PRIVATE BAND.

A FRIEND of ours, having determined to give a musical party, looked about amongst his acquaintances for suitable guests, and after considerable cogitation and inquiry made up his mind to invite the following:

Jones, because he was so clever in blowing his own trumpet.

Brown, because he possessed the ability of harping on one str ng.

Smith, because, even if you stopped him in the street for a moment, he began to fiddle with his collar.

Tompkins, because the sight of a thirteenth card of a suit filled him with an irresistible wish to "trump it."

Robinson, because, if rumor was true, he was undoubtedly a "base-vile" man.

Johnson, because, according to all accounts, he played second-fiddle to his wife.

Simpson, because, as a newspaper proprietor, he had an organ of his own.

Richardson, because he is so good at the long-bow, and

Samuelson, because he and his wife are celebrated for their kettle-drums.

A LASS

"Say, what is a lass?" his small brother inquired,
And the youth, with a smile that was sad,
Made answer, as if by the question inspired,
"A lass is alas to a lad."

AN ex-Professor of ancient languages at the University of Virginia, peddles apples in Galveston. Having failed on Greek and Latin roots he has very sensibly taken to the productions of his native soil.—*N. Y. Com. Advertiser.*

AN English nobleman, who is in the habit of speaking to soldiers in an affable manner, was much amused lately when a guardsman said to him, in a hearty and genial way, "I like you, my lord. There's nothing of the gentleman about you."

A PREACHER in Kentucky the other Sunday, becoming exasperated, paused in his discourse to say: "Ladies, if you will give me your close attention I will keep a lookout on that door, and if anything worse than a man enters I will warn you in time to make your escape."

A LITTLE girl visiting a neighbor with her mother was gazing curiously at her hostess' new bonnet, when the owner queried: "Do you like it, Laura?" The innocent replied: "Why, mother said it was a perfect fright, but it don't scare me." Laura's mother didn't stay long after that.

A Dangerous Torpor.

Torpor or inactivity of the kidneys is seriously dangerous to those organs, since it is the precedent of diseases which destroy their substance and endanger life. This sluggishness may be overcome by stimulating them, not excessively, but moderately, an effect produced by Hostetter's Stomach Bitters, a general invigorant and alterative, possessing diuretic properties of no common order. The impetus which this admirable medicine gives to their evacuative function counteracts any tendency to congestion which may exist in their tissues. Both they and their associate organ, the bladder, are invigorated as well as gently stimulated by the Bitters, which exerts a kindred influence upon the stomach, liver and bowels, and by strengthening the system, enables it to withstand malarial epidemics, to which when exposed it might otherwise succumb.

EVOLUTION.

Effects of High Cultivation.

LIGHTNING HAY KNIVES.

WEYMOUTH'S PATENT.

This Knife is the best in use for cutting down hay and straw in mow and stack, cutting fine feed from bale, cutting corn stalks for feed, cutting peat and ditching marshes.

The blade is best cast steel, spring temper, easily sharpened and is giving *universal* satisfaction. A few moments' trial will show its merits, and parties once using it are unwilling to do without it. Its sales are fast increasing for export as well as home trade, and it *seems destined* to take the place of all other Hay Knives.

They are nicely packed in boxes, one dozen each, of 50 lbs. weight, suitable for shipping by land or water to any part of the world.

Paralysis,
Sexual Exhaustion,
Spinal Diseases,
Indigestion,

And other chronic ailments.

VOLUNTARY TESTIMONY.

[*Extract from the Baltimore "American,"*
December 21, 1878.]

"The Pulvermacher Electric Belt is recommended to general use for the following reasons: First, for its wonderful properties for the cure of diseases of the kidneys, stomach, liver and blood; secondly, for its extreme simplicity, and the fact of its being applied outside, precludes all possibility of any injury being done to the patient, as an external remedy is universally acknowledged to be safe. Another advantage is the facility with which the progress of the disease and cure can be watched, and if the Belt be not quite in the right place, it can be very easily readjusted so as to cover the parts affected. The Pulvermacher Electric Belt, and its perfection, has been hailed with delight, not only by the sufferers who have regained health, enjoyment, and a new lease of life through its beneficent qualities, but by the medical profession, who very frequently prescribe its use to their patients."

PULVERMACHER'S ELECTRIC BELTS AND BANDS

are indorsed and approved by the most eminent medical and scientific authorities in the world, by the Faculties of France, England, Austria, Prussia, Belgium, and America, and by well-known writers, who refer to the extraordinary cures effected by Pulvermacher's Electric Belts and Bands, in upwards of one hundred medical and philosophical works.

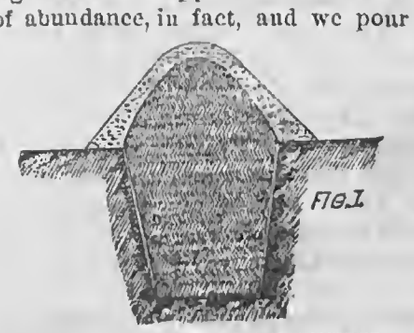
Farm Topics.

A NEW METHOD OF PRESERVING CORN AND OTHER GREEN FODDER.

BY A WESTERN FARMER.

Necessity of more thrift in feeding stock in the West; cheapness and great value of green-corn fodder; method of growing and preserving it for a long time; a temporary "silo," its construction and management; a permanent silo; ration of preserved fodder for cattle.

THE resources of the great western States are not economically husbanded. The same may be true of the East, but in the West the wastes are larger and more apparent. There is an excess of abundance, in fact, and we pour our

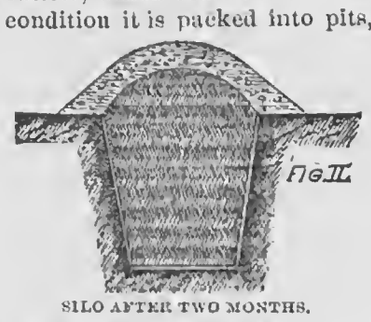


A SILO FRESHLY FILLED AND COVERED.

superabundance out with a lavish hand in the use of it. To some extent this waste pays, or rather it would not pay to spend labor, which is costly, in saving and using fodder, which is cheap. But things are changing very rapidly in this respect, and to husband and spend all our produce in the most economical manner will soon be indispensable to thrift, if not to the solvency of the farmers. Many Western farmers now cook their corn in feeding it to hogs and stock, who formerly threw it out lavishly upon the bare ground.

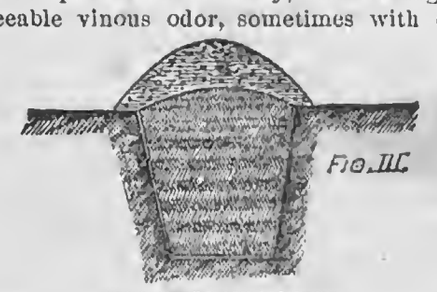
But corn is rarely grown for fodder alone either in the West or in the East, yet it may be made one of the most valuable feeding crops. Forty tons of roots per acre are considered a very large crop, but forty tons of green-corn fodder, worth more than the roots, may be as easily and more cheaply grown than the same quantity of the latter. And by a new process of preserving it, it may be kept fresh and succulent for a whole year, if need be. This method is a French and German practice, not new in those countries, but it is of recent introduction here, and will undoubtedly become common as soon as its usefulness and value are known. The method is as follows:

The corn is planted in rows as closely as may be to procure the heaviest growth. When the growth is the most vigorous and succulent—which is when the ears are still soft and full of milk—the crop is cut down. It is hauled directly to the barn and run through powerful fodder cutters, which reduce it to a fine chaff. In this condition it is packed into pits, called



SILO AFTER TWO MONTHS.

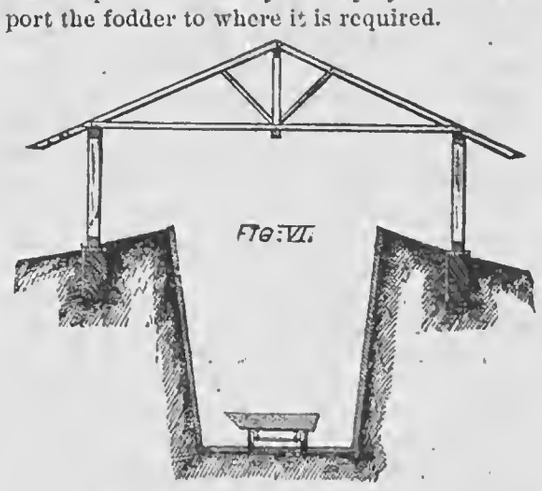
"silos," which are trenches dug in the earth, with sloping sides, about six feet deep and wide, and as long as may be required. The cut fodder is tightly packed in this trench, and is heaped up as high as possible in the manner shown at Fig. 1. It is covered with a layer of straw, and then with two feet of earth, well packed down, to exclude air. The success of the operation depends upon the complete exclusion of the atmosphere, when a fermentation occurs in which the starch of the fodder is converted partly into sugar, and the sugar partly into alcohol and some acid. The indigestible portions of the fodder are changed into soluble matter to a considerable extent, and the whole mass undergoes a transformation into a brownish substance retaining its perfect shape and consistence, but much more solid and compact than formerly, and having an agreeable vinous odor, sometimes with con-



SILO AFTER SIX MONTHS.

siderable mild acidity. After two months, the mass shrinks and settles into the shape shown at Fig. 2; and after six months, into that shown at Fig. 3.

During this settlement great care is to be taken to watch the covering and close every crack that may appear through which air might penetrate to the mass of fodder, and convey germs of moldiness or decomposition. When the pits are opened for use, this is done at one end and the cured fodder is cut down with a large knife, fig. 4, (an improved form of which will be seen in our advertising columns), as it is wanted for consumption; the cut surface being left compact and smooth. A frame of tight boards, to exclude air, is placed against the cut surface (fig. 5), and it is supported by a prop, as shown. This frame is moved along as the fodder is consumed, the earthen covering being thrown upon one side out of the way as the fodder is uncovered. The "silo" should open into the building, preferably a cellar, in which its contents are to be used, and a truck upon wheels may be employed to transport the fodder to where it is required.



PERMANENT SILO WITH ROOF, TRAMWAY AND TRUCK.

Permanent silos are made of brick-work, or cement concrete upon the floor and sides, and are covered with a roof for protection (fig. 6). They may also have a tram-way laid in the bottom for the passage of a light truck. A convenient place for the silo would be adjoining a cellar under a barn and opening into it by a door. Very similar constructions are used by Eastern dairymen for preserving brewery grains during the summer, and the method of preserving these is precisely the same in every respect as that above described for corn fodder. A permanent silo may also be built wholly above ground, of brick, with cement lining, and covered by a roof. Such constructions as these are becoming common among French farmers, who practice the system of ensilage. Many of these put away 500 to 1,000 tons of fodder every season, feeding 100 or more head of cattle.

A usual daily ration is 50 pounds of the preserved fodder for a large fattening beast, with more or less of grain; and 40 pounds for a milking cow, with rations of bran or other additional feed. The nutritive quality of the fodder is increased in proportion to the reduction of the water contained in it, so that 40 pounds of it would be equivalent to about 80 pounds of the fresh fodder. The preserved fodder is consumed with keen relish and is remarkably healthful.

I should have said that salt, at the rate of one pound to the thousand of the weight, is sprinkled upon the cut fodder, as it is packed away; and this tends greatly to the preservation of it.

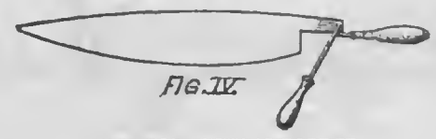
Dairy Husbandry.

NEW STYLES OF PUTTING UP BUTTER.

T. H. HOSKINS, M. D.

A growing change in public taste for butter; its advantages to the dairyman; consequent change in the style of butter packages; the Tinkham package; the Kenerson package.

THERE has never been a greater revolution in the butter trade that the sudden demand that has sprung up for new butter, fresh-made butter, to the exclusion of even the best tubs of "entire lots" of a season's make from first-class dairies. Accompanying this is a change of taste, to some extent, as regards the saltness of butter, so that, instead of the old standard of one ounce to the pound, we are told by dealers to reduce the amount to three-quarters, half, and even in some cases to only a third of an ounce of salt to each pound of butter.



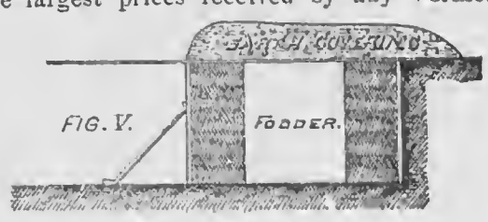
KNIFE FOR CUTTING FODDER.

Whence this sudden change in the tastes of our city customers has come, it would, perhaps, be difficult to tell. It is probably, however, a European importation. Our cultured and traveled fellow-citizens who have returned from the Paris Exposition, having brought over from France the Parisian taste for freshly made and lightly salted butter, have set a fashion that has rapidly spread among the "would-bes"—those not able to go abroad themselves, who console themselves by adopting, as quickly as possible, the foreign notions which their more fortunate neighbors bring home along with the "true Parisian aecent."

However this may amuse us, we, as dairymen, have no reason to complain of the new fashions in butter. In this time of small profits, it is lucky that thus we may at least have quick returns, and as butter is never any better than when first made, we are also saved the risks of great deterioration, a mishap from which we are never exempt, even with well-made butter, and which is both the sure and rapid fate of all other kinds.

With this change in taste comes a demand for a change in the style of putting up our butter. Hardly anybody now wants to buy a fifty, or even a thirty-pound tub. The call is for five and ten-pound packages, and already the Vermont dairymen, at least, are responding to this call in various ways. I will give the readers of the RURAL an account of the two plans now coming rapidly into use among those who make a "gilt-edged" article for the Boston market.

The first is what are known as "Tinkham Packages," first introduced—and not patented—by O. M. Tinkham, the agricultural editor of the Green Mountain Freeman, and one of the first to introduce Jerseys into Vermont. Mr. Tinkham lives in the town of Pomfret, where the manufacture of fancy butter has been for many years a specialty, and where, probably, the largest prices received by any Vermont

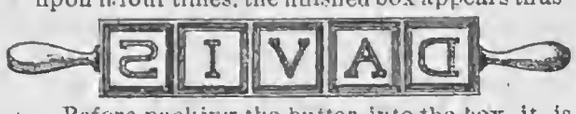


REMOVAL OF THE FODDER.

dairyman have been realized for small prints—two and four-ounce—sold to first-class hotels and restaurants in Boston. Besides those engaged in producing this specialty, there is a considerable number of the Pomfret farmers who supply families in the large cities with choice butter. Heretofore this has been sent to market in 25-pound tubs. But the call for fresh and frequent supplies, both by families and the fancy-grocery trade, has stimulated the ingenuity of our Pomfret friends, and has resulted in the plan devised by Mr. Tinkham. This consists of rectangular boxes, joined firmly at the corners by the sort of square dove-tailing which the Crandall blocks and other toys have made familiar. These boxes are made of spruce, to hold five and ten pounds of butter, and have either a sliding cover or a simple lid. A sort of tasteless wood paper is used to line the boxes, and the butter, when weighed, is firmly pressed into them, the top neatly smoothed, and the maker's stamp or monogram impressed upon its surface. These boxes are placed in a refrigerator until the butter has become very firm; they are then packed in cases, which are lined—top, bottom and sides—with hair felting, and, thus protected, they arrive at market in perfect order, even in the hottest weather. In cool weather the lined cases are of course not needed. This style of butter package is very acceptable for families and the best retailing trade, and has been adopted, with slight variations, on many dairy farms throughout the State.

It will be seen that Mr. Tinkham's method, while it is adapted to the family and grocery demand for small packages, does not meet the requirements of the small-print trade, which is considerable and increasing. This has been effected recently by an invention—patented—of Mr. James B. Kenerson of Peacham, Vt. His boxes are made and joined like Mr. Tinkham's, but are flatter, being intended for only one layer of prints. They are, I think, about an inch and three-quarters deep, very neatly made, with sliding covers. They are made of different sizes, adapted to the prints they are to hold. Those I have seen were for 20 and 40-quarter-pound prints, thus holding respectively five and ten pounds of butter. I suppose there can be no patent on the boxes themselves; this I think is limited to the stamps, which I shall describe, with a rough sketch. For the five-pound boxes the stamp is divided into five sections, thus:

The edges of each division are very much raised, and made thin, with a tapering edge, so that when the stamp is pressed upon the butter in the box, it is divided through half its thickness, and a stamp having been pressed upon it four times, the finished box appears thus



Before packing the butter into the box, it is lined with a fine muslin cloth, wrung out of clear brine, and a similar cloth is laid over the top before the cover is put on. The consumer, or the retailer in selling less than a box, cuts the prints apart with a knife along the deep divisions made by the stamp. This method of putting up fancy prints has been extensively adopted in Caledonia County, and meets with great favor in the Boston market. It is claimed that the expense is but a trifle more than that of tubs, the prices being for five ten-pound or ten five-pound boxes and crates, at the factory, only fifty and sixty cents respectively The crates are plain and cheap. In warm weather it might be better to use Mr. Tinkham's more costly felt-lined return cases, mentioned above.

The dairymen who have made use of either

of these methods of packing, speak favorably of them, and say that well made butter of good color so put up, brings from five to twenty cents a pound more than when packed in tubs; the latter price only, of course, for established brands. It will be seen that Mr. Kenerson's method greatly simplifies the making of small prints, or indeed prints of any kind. As many stamps are used on each box as there are varied inscriptions, or figures, on each row of prints. If the same figure, letter, or monogram is impressed on every print, only one row of stamps is required.

Farm Economy.

THE HISTORY OF A POOR FARM.

No. 3.

HIRED HELP.

I SUCCEEDED in letting a contract for ditching the swamp at 25 cents a rod, the ditches to be two feet wide at the top, three feet deep and one foot wide at the bottom. At this rate a good man with good tools will make 75 cents a day, at least, digging three to four rods. Six feet in length of the ditch will make one cubic yard, and I had offers to dig the ditches at ten cents a cubic yard. There never was, or will be, any better time to make improvements of this kind than the present, and every farmer who has such work to be done, and has the money to spare for doing it, should seize the opportunity now. There are hundreds of industrious men seeking employment, and to set such men at work is a kindness, as well as a just action. "The world owes every man a living." This is a hackneyed and oftentimes an illused adage; but it is true in one sense; every man ought to be at work, and there is something wrong when honest, industrious men cannot find work to do. The squire of the village, Mr. Martin, stood by as I said this to Doctor Jones, who had just called on me, and who is a noted farmer; "You are something of a communist," said he.

"That is not what I understand the so-called communism to be," I replied. "This is a division of the results of labor, and the degradation of all men to one common level, so that one man should not in any case have one dollar more than another, however well he may have earned it by means of superior skill, industry, or management. It is to a farmer's interest to employ as much labor as he can turn to advantage. Rather than have a field lie idle for want of labor, I would have the owner set a man to work on it, if he can make the labor return its cost and something besides for the use of the land; and I have never known a time when he could not do that by good management."

"What is wanted," remarked Dr. Jones, "is a supply of steady labor. A hundred acres of land ought to give work to three men, at least. To feed and care for 15 cows require the constant labor of one man, and 100 acres ought to feed at least 40 cows or yield an equivalent supply of food products. With a settled class of farm laborers we should have frequent small hamlets or villages; every 10 farms or 1,000 acres would need 10 farm homesteads and 30 laborers' cottages; and for 10,000 acres, or an area of four miles square, there might be a village of 200 or 300 houses for farm laborers, besides stores, shops, mechanics' houses, schools, churches and all the other accessories of a civilized society."

"Not forgetting the Doctor's office," said Mr. Martin.

"Nor a lawyer or two to encourage litigation," rejoined Doctor Jones jestingly.

"It is true," said I, "that at present, farm labor is carried on too much by a migratory and unsettled class, and that this works much mischief. It would be to the farmer's interest to build neat, comfortable cottages for his hired men, and encourage the presence of married men and families by giving a preference to them; and to each cottage a garden should be attached. There would then be a home market created for much farm produce, such as milk, butter, vegetables, flour and meat; and this would help very much to support an extra number of laborers, who would in fact subsist themselves out of the extra product of the farms, leaving as much as ever to be sold or shipped to distant markets.

"The product of one acre ought to be sufficient to provide for the wants of one person, so that ten farms of 100 acres each, ought to support a home population of 500 persons and yet to ship away half the products to make business elsewhere. The nucleus of a population will always be the laborers on the land, and it is to the farmer's interest to encourage the settlement of laborers, not only because of the home market thus provided, but because the value of land is in direct ratio to the number of the adjacent population. A settled class of laborers would soon wish to own their houses, and a demand for small building and garden plots would spring up. When laborers own their own dwellings and gardens, then the employers will have a better and more satisfactory supply of labor; then, too, there would not be such a rush to the Far West of our best men who are anxious, and properly so, to find permanent homes for themselves and their families."

"But how," inquired Mr. Martin, "are farmers to pay for such help? For a hired man to be able to support a family, much less to buy and own a house, would require higher wages than farmers can afford in these times, when everything a farmer has to sell is lower than it has been for thirty years."

"Labor is to be valued according to its quality," said I. "A good man is worth two or three poor men; and the more efficient a laborer is, the more money he can earn and the more profit his employer can realize from his work. As with all other things so with labor, the best is the cheapest. Here is an instance; one man at work in this swamp can dig five rods of ditch in a day and make a neater and better job than another who only digs three rods or less. The one earns $1.25 a day and the other 75 cents. I can hire both at $25 a month each, but should lose money at that price by one, and could well afford to pay the other $30 a month. It is so with all other work, and the better trained and steadier farmers' hired men become, the more profitable will be their work to their employers. Besides, we can always hire a man for a year for about as much as would be paid for nine months' irregular work. If a man works but half the time, he must earn enough to keep him all the time, and farmers ought to learn this lesson, and try to keep their men busy the year round."

"How can they do that?" asked Mr. Martin, "there are stormy days, and in the winter how can employment be found for hired men?"

"Make work for them," replied Doctor Jones.

"Precisely," I remarked; "In the stormy days there are tools to be sharpened, implements and harness to be repaired, and a farmer will find one of the best investments he can make will be for a workshop and tools; and one of the best things he can do, is to learn to use them himself and teach his men to use them. In the winter time there is much to be done to prepare for the spring and summer work, and it will be more profitable to keep the men at work if it is only to card the cows, clean the barn, or scrape the trees in the orchard, than to pay a whole year's wages for nine months' work. Farmers ought to make more of a study of this part of their business, for in time the farmer who does not employ laborers steadily will be but a laborer himself and earn only a laborer's wages."

WORK FOR FEBRUARY.

HEAD WORK,—On the farm at all times, this kind of work pays the best returns for the time given to it. Head work is too much neglected, considering the sure and large profits which are certain to follow its employment. February is the month of all others for study. The accounts and inventory of the previous year are fixed up. The grange or farmers' club is in full blast, and very likely doing its best. This is the time of year for meetings of pomological societies, for farmers institutes, for meetings of men especially interested in bees, swine, sheep, cattle, horses or any particular breed of domestic animals. These conventions are of more value to those who attend them than to those who remain at home. Some farmers act as if they were ignorant of this self-evident truth. The advantages are numerous and important. Men engaged in a common interest or specialty learn from each other. They get acquainted; they pick up new ideas; they gather enthusiasm; they go to work again with a better understanding of their business. No matter whether you are an officer or not, you are always a welcome listener, at any rate, in any of the above gatherings.

BOOKS AND PAPERS.—The farmer has selected his list of agricultural papers, and they are now coming regularly with all of their improvements. He has added to his library a few of the best and most recent books on his specialties. We hear less of book-farming than formerly. Books on agriculture are better than they were. People never expect to use all the advice given on any topic even by the most practical and successful man, but this is no reason why they should not consult the best men who are engaged in the same business with themselves. The same rule may be applied to books. We should be able to pick out from books some valuable hints applicable to our own wants. One book has a picture of a wheat stack about two-thirds done. The stack is cylindrical and flat or dishing at the top. That is no way to build a stack, and every farmer knows it; but after all every farmer might read the book with profit.

VISIT FRIENDS AND TAKE NOTES.—Every enterprising farmer who intends to progress is keeping accounts with various departments of his business. Each of his fields is charged with the work, seed and part of the manure put on it, and credited with what comes off. He keeps a diary, not writing for the sake of writing, but to make note of any new idea which he wishes to use during the next year. He sees a new gate latch, a sheep rack, a manger, something desirable about some farm implement, and he makes a note of everything of the kind by word or drawing. These notes are looked over every little while during the year. There are many advantages in visiting good farmers. Look about you for men who raise superior wheat, corn, potatoes and other crops, and live stock. If they are ahead of you, buy some of the extra seed or stock and enter into a healthy competition with the best of them.

GET UP WOOD; REPAIR IMPLEMENTS.—During the sleighing time the farmer is getting up wood, drawing logs to mill, marketing produce, visiting friends, etc. The drag teeth are sharpened, the plows repaired, the mower put in order, the wagon and buggy taken to town to be painted and put in first-rate order. He will not neglect to store ice for the summer.

EXERCISE FOR STOCK.—All kinds of stock will be the better for moderate exercise. This advice applies especially to animals which are kept in stables. Cows and horses should be let out for a part of each day, unless the weather is exceedingly severe or stormy.

MANURE.—If you are near town, it may be best to buy and draw manure during the winter. Take care of what is made on the farm. Look out for fire-fang in horse manure. Turn it, or mix it with manure of hogs and cattle.

ECONOMY.—Save as much as possible of everything useful if it does not cost too much labor. Time is money. Labor is money. It is poor economy to buy old stock at any price, to feed for profit. Young, thrifty stock pay much the best returns for feed consumed. Weigh them often, and when they cease to give returns for feed and trouble, dispose of them. Contrive in every way to do the chores with as little labor as possible, without neglecting anything. Try to save steps. We know of instances where two men take better care of the stock on a large farm than three or four do on a smaller farm. It is not economy to feed straw alone to any animal. It is not composed of the right materials for profitable feed. Oil cake, corn meal, or shorts will supply what the straw lacks. In this way, straw may be fed with profit to many animals. As profits are small at best, all these details of labor, age of animal, food etc, must be attended to.

FARM EXPERIMENTS SUGGESTED.

PRACTICAL knowledge is only to be acquired by actual experiment, and is the only kind of any real value. If all soils were exactly alike, having the same exposure and protection, subject to the same climate, and the same amount of rainfall at exactly the same dates, farming would at once rise to the dignity of an exact science. One set of experiments anywhere would be the foundation for all farm operations of the same kind everywhere. The vast body of farmers, so far as concerned their own avocation, would become mere machines, or even less in the social scale. Brains would be of no value, and the fool of the family would do as well as the genius on the farm.

Fortunately, however, the soil is various and must be treated with brains or it fails to produce. Business men never trust any one until inquiries have been made into his standing and his ability to fulfill his promises. Farmers, however, never think of inquiring into the character of the land they are going to trust their seed to. They say to themselves, "That's land, and this is seed, let's try them together."

It has been asserted that fertilizers are all washed down into the subsoil by rains, and are lost—if so, why is the subsoil always poor? An experiment, easily made, would settle this question for ever. It is the practice with many to put on too much lime, hoping to create plenty of plant food. But they create too much, and the crop goes to stems and leaves at the expense of the grain. Experiment would teach a valuable lesson here. The question of deep or shallow plowing and cultivation is yet a debatable one; why not experiment, prove that which is good and hold fast to it? Light and heavy seeding; early and late sowing; home-grown or foreign-grown seed; seed grown north or south of us: seed gathered when half-ripe or when wholly mature; subsoiling, and even whether it pays to feed starving fields as well as to keep stock always growing, are all open questions.

Why is this so? Why have six thousand years of ceaseless tillage taught us nothing? And are we to go on six thousand years more in the same style As every farm is, in a measure, *sui generis*, so must every farmer be its *genius loci*. Don't trust a man till you know *him*. Don't trust your land till you know *it*. Experiment, dig, pry and inquire at every possible opportunity; don't quarrel with a family you are not acquainted with, and, above all things, don't bury money in a hole without a bottom. S. RUFUS MASON.

Field Crops.

EXPERIMENTS WITH POTATO SEED.

HAVING heard much said about the difference in the crops produced by the seed taken from the different parts of the potato and from seed of different sizes, I determined last spring to make a series of experiments for my individual satisfaction, and I now relate them for the benefit or satisfaction of others.

I selected for my experiments seven leading varieties of potatoes, as follows: Early Rose, Peerless, Compton's Surprise, Victor, and Snowflake from seed grown on my farm, and Late Rose and Eureka from seed grown in Illinois, taking of each variety one and a half bushels of large and small potatoes as they had come from the field the previous Autumn. I first sorted out the small potatoes—those the size of a walnut and less—and cut them for planting to single eyes, as far as practicable. I then cut the large-sized ones to single eyes, keeping the seed from the eye, or seed end, separate from that nearer the stem, dividing the seed into two equal portions, as near as might be.

They were all planted on new land, in the same field, being the second crop on the land since it had been cleared of timber, a portion of the field having been planted to corn and a portion to potatoes the previous year. They were planted May 15th to 20th in rows three feet apart and the hills about two feet apart in the rows, three pieces, or eyes put in a hill. No manure whatever was ever applied to the ground. After they were well up, I harrowed them with a light one-horse harrow, following soon after with the hoe and hoeing up the sorrel, which is always very plentiful on new ground in this section; and about the time they were in blossom, immediately after a soaking rain, I cultivated with a shovel-plow, and hilled them up with the hoe. Upon inspecting the growing vines, I found in every variety the poorest stands in those rows planted with seed from the stem end of the large potatoes, and the best stands of the Peerless, Early Rose, Victor and Eureka were in the rows planted with seed from the seed end, while the best stands of late Rose, Snowflake and Compton's Surprise were in the rows planted with the small potatoes. In every variety the vines from the small potatoes were more puny and spindling than the others, and the most stocky and vigorous vines were found in every instance in those rows planted with seeds from the eye or seed end. In some cases the difference was so slight as to be discernible only upon most careful observation and comparison, yet the rule held good with every variety.

I am of opinion that the harrowing augmented the difference in the stand in favor of the more stocky vines from the seed end of the large potatoes, by tearing out a greater proportion of the more puny ones. The rows planted with seed from the stem end were a little later than the others, otherwise there was no perceptible difference in the season of ripening. From every variety I harvested the largest amount and the largest potatoes from those rows planted with the seed end of the potato. The next in amount was harvested from those planted with small potatoes; yet the rows planted with seed from the stem end produced tubers of a more even size, but smaller in amount, there being in these rows no potatoes of the largest size and very few small ones. My conclusions, therefore, from these experiments are, that it is best with these varieties at least to select seed from the eye, or seed, end of the largest potatoes.

As to the comparative productiveness of the several varieties, I find the Peerless largely exceeds any of the others, Victor and Late Rose ranking next, then Early Rose, Eureka, Snowflake and Compton's Surprise, in the order named. I also found that the yield was nearly double on the ground where potatoes had been raised the previous year.

It was my intention to weigh the product of each variety and those from the several divisions of the seed separately and by rows; but the potato crop in this section was nearly an entire failure and families in the village were unable to obtain any at any price. So, as my field was the only one where any were growing, the pressure to dig and sell the different varieties as they ripened was too great for me to withstand. I intend to repeat the experiments next season with these and several other varieties upon a small scale on two experimental plots, one of clayey loam, and the other a sandy ridge with but little loam. If other readers of the RURAL have experimented in this direction, I should be pleased to hear from them. GEORGE PINNEY.

Door County, Wis.

EXPERIENCE WITH PRICKLY COMFREY.

AS this new forage plant is attracting some attention, and as various opinions have been expressed about it, I will give to the readers of the RURAL my experience, as tending to throw light on the subject.

This plant is said to have come from the Caucasian Mountains, and has been lately introduced as a forage plant into this country. It appears to have been tried in England and France prior to its appearance here, and the reports of its yield in those countries, where the art and science of agriculture are much advanced, are very favorable. It is said that there it will yield from 75 to 100 tons per acre; that all stock, cows, horses, sheep and swine are fond of it, and do well on it. Now, if all this be true, it is a plant worthy of attention.

In the spring of 1877, I got 1,000 root cuttings and set them out in a bed to sprout. The situation of the bed was not well chosen, the ground being too wet; and as the spring was cold and backward, I only got about 500 sprouts, or plants, and these not until the first week in May. These were planted in hills three feet apart each way, one plant to the hill, with a shovelful of manure put into the hill before setting the plant. I cut my first cutting about the last of July, then cutting eight pounds to the hill, and getting two subsequent cuttings before the setting in of winter. This year I got my first cutting about the last of May, and have cut three times since. I top-dressed the ground well last fall, after the last cutting, and have done the same thing this year. I have cut during the year about 30 lbs. from each hill. I find it wonderfully vigorous and rapid in its growth, and perfectly hardy.

Now, in regard to its value as a forage plant. When I commenced to cut it last year, I began feeding it to my milch cows, in the sheds. A few of them took to it at once, and very soon ate it with avidity. The greater part of them, however, would not touch it, and had to be taught to like it. All finally became very fond of it, and we found both the quantity and quality of the milk greatly improved by its use. I regard it as of great value as forage for milch cows, and am sure that with proper cultivation it can be made to produce at least as much forage to the acre as any plant known. I am prepared to set an acre of it. It is propagated entirely from root cuttings, the roots being very hardy, and every little cutting of an inch in length will, under favorable circumstances, give a plant. I have not tried it as forage for anything but cattle; but it is said that horses, sheep and hogs are all fond of it, and do well on it. [But the taste for it must first be cultivated.—EDS.] T. M. H.

Ritchie Co., W. Va.

LOST NATION WHEAT.

THIS is the name given to a new kind of grain that was introduced, in this vicinity, two years since. Last season its reputation became established, as there was a good deal of it sown, and it yielded remarkably well. Many farmers raised thirty bushels to the acre. This, for Vermont, was an enormous yield, eighteen or twenty bushels to an acre having been heretofore considered a fair crop. The kernel is very large and plump, and the flour is as fine and white as the best brands of Western flour. It is a bald wheat and makes a quick growth; the stem is large and stout, so that it does not lodge easily. It is certainly the best kind of wheat that has been introduced in this section. There is a tradition about its discovery; but it is of little account as long as the grain speaks for itself. All other kinds will be discarded in this region another year. It is a spring wheat. Neither rust nor weevils injured it. S. H. R.

Randolph Vt.

Horticultural.

WORK FOR HORTICULTURAL SOCIETIES.

I AM heartily rejoiced to learn that the New York Horticultural Society announces a discussion of various questions connected with the growing and marketing of choice fruits, etc., all of which are of vast importance, and the general interest now felt throughout the country in relation to the subjects named in the issue of Jan. 11, page 24, leads us to hope the most searching analysis will be given, embodying the most rigid observation, and replete with stubborn facts. In the selection of fruit trees, raspberry, blackberry and gooseberry plants, we have in all the past years been guided by the *ipse dixit* of some wholly interested nurseryman to purchase some new and fabulously valuable sort just now for the first time in the world's history being offered for sale. And the only proof we can get in support of the idea of the true merits and value of such trees and plants is seen in the fabulous prices asked for them. Thus the amateur grower of fruits finds out, after much watchfulness, care and cultivation, that the said nurseryman or tree dealer was only riding his own hobby onward to a fortune.

But I, for one, trust that those who are about to discuss these and kindred subjects, will bring the light of facts, not guess-work, to bear upon them, so that those who wish to plant Raspberries need not be misled into paying fifty cents for a plant not worth three cents.

As a grower of fruits, I will here say that from an experience of twenty-five years, a peck of dry slacked lime heaped about the peach tree, does not prevent the ingress of the borer. I tried not less than 25 remedies, lime among the rest, and yet the worm was found at work about the crown of the roots in Autumn. The true remedy is found in the use of clay paint put on so thick the insect cannot sting through it. The paint is made of clay and water.

Hartford Co., Ct. E. P. GOODSELL.

FINE PLUMS, CORN MEAL AND CHICKENS.—"Throw your corn meal siftings around the trunks of your trees in spring, and the chickens will attend to the curculio pest. Before I adopted this plan, nice plums were scarce in my garden, since then they have been real beauties." So writes a correspondent of ours down in Texas.

Pomological.

APPLE TREE CULTURE FROM SEED.

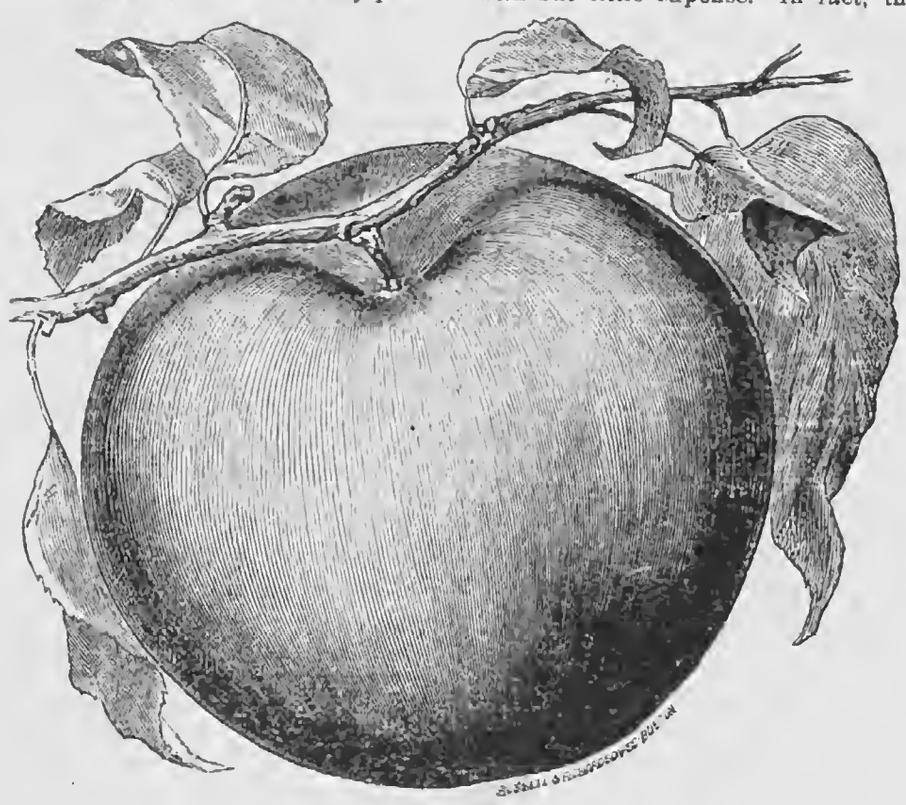
As the RURAL NEW-YORKER is a very important medium for interchange of thoughts and experiences of practical farmers, I wish to relate through its columns my experience in propagating apple trees from the seed:

Some twelve years ago becoming somewhat discouraged in attempting to secure fruit from purchased trees, owing to their early death, I concluded to try the experiment of raising my own trees. The result has been exceedingly gratifying. A moderately rich piece of land, about two rods square, was prepared for sowing the seed, by plowing it deep and fine, and laid out in rows about three and one-half feet apart. In these rows I sowed pomace from the cider-mill, covering it about two inches deep. The following spring, the young trees appeared in profusion. These I thinned out to six or eight inches, leaving only strong, healthy shoots. The ground was kept well cultivated and free from weeds by the use of the cultivator and the hoe. The first season the trees made a growth of from twelve to fifteen inches. The second season the same method of cultivation was employed, and the trees made a thrifty growth, being in the fall as large as clay-pipe stems at the base of stock.

The following spring I secured the services of an experienced grafter, and with my assistance, the entire lot of trees was grafted in one day by the method known as splice or lap grafting. The cions used were mostly from bearing trees of Northern Spy and Rhode Island Greening, as I consider these varieties the standard ones for this latitude, both for table and market. A large percentage of the grafts grew, and after remaining two years in the nursery rows, receiving good cultivation in the meantime, they were transplanted to the orchard, without the loss of a single tree in transplanting. I now have just coming into bearing as fine and thrifty a young orchard as can be found in the county, besides supplying my neighbors with many trees, all of which are doing much better than trees brought from the Western nurseries and set out at the same time.

Some of the advantages in raising one's own trees, are the following: When trees are brought from distant nurseries, they are, in the majority of instances, set out in soil of a nature entirely different from that in which they were raised—a circumstance which, combined with the difference in temperature and the delay which often occurs in resetting them, is, in my opinion, a prolific cause of the great amount of complaint we hear about purchased trees not doing well. On the other hand, trees raised in a soil and temperature like those of the place where they will be transplanted, the roots not being allowed to dry and wither from long exposure to the air, are acclimated, and consequently hardier and more certain to thrive. Again, it is far cheaper to raise one's own trees than to buy them. With a little care at the outset, and a few days' work each season while they remain in the nurseries, five hundred or a thousand nice trees can be raised with but little expense. In fact, the outlay will not approximate to what would have to be paid for the same number of trees, if bought, and the result will be far more pleasing—to the orchardist. It may be superfluous to add, in this article, what every successful tree grower already knows, that to make fruit-raising a success, the trees must receive constant care and frequent cultivation, after the orchard is once established. I have no hesitation in saying that trees raised at home, and properly cared for, will abundantly pay for all the labor and expense of raising them.

Washington Co., N. Y. JAMES E. MCCLELLAN.



THE STARKEY APPLE.

THE STARKEY APPLE.

THE original tree of this apple (figured above), grew from seed upon a farm in Vassalborough, Kennebec County, Maine, now owned by Mr. J. W. Starkey. It was broken down in a gale in 1872, being at that time 16 inches in diameter. The variety is hardy in that vicinity, a vigorous grower in the nursery, but less so after coming to bearing age. It is a very bountiful bearer, fruiting every year, but most abundantly in even years. Fruit medium in size, round or oblate, smooth and fair; color yellow, striped and splashed with bright red and covered with light gray dots; stalks slender, ¾ inch long; cavity small and even; flesh white, firm, crisp, juicy, of a pleasant lively sub-acid flavor. In its prime in November, but with care will keep well into the winter. Quality, as defined by the Maine Pomological Society, very good; excellent for dessert, and popular in market, being of good color as well as high quality. It is less tart than Gravenstein, but more so than Jewett's Fine Red.

NOTES IN A NORTHERN ORCHARD—3.

T. H. HOSKINS, M. D.

THERE is quite a large number of varieties of Apples to which, in our climate, the tantalizing description "almost hardy" will apply. These are the "hardy Apples" of the climatic belt just below us. Most of them are well known, and have long had a place in the standard works on pomology. Consequently I need only mention them with reference, not to description and quality, but to hardiness alone. Among summer Apples of this class I may name William's Favorite, Red Astrachan, Cole's Quince, Sops of Wine and Maiden's Blush. All of these have been grown, under favorable circumstances, in the cold belt, but an orchard of them would never be a source of profit. As root-grafted or budded trees the stem is always unsound, and when they reach the bearing size, the first full crop of fruit or severe gale will break them down and destroy them. They do better top-grafted into the smaller limbs of hardy kinds, and a few trees for home use thus produced are desirable.

Among fall Apples of the same class are Colvert, Northern Sweet, St. Lawrence, Fall Wine-sap, Moses Wood, Saxton Stripe, and a number of others. Of these St. Lawrence is the hardiest, and sometimes does quite well even when not top-worked.

There is a large number of almost-hardy winter kinds. The most successful with me are Famense, (which, like St. Lawrence, sometimes succeeds root-grafted or budded) Clyde Beauty, McClellan (early winter sorts), Westfield Seek-no-Further, Blue Pearmain, Talman's Sweet, Golden Russet of Western New York, Jewett's Fine Red (Nodhead), Yellow Bellflower, Canada Reinette, Ben Davis, Bethel (of Vt.), Ramsdell's Sweet, Bailey's Sweet. This list might be enlarged indefinitely, but orcharding limited to selections therefrom would prove, in the "cold belt," little better than a provoking failure. Yet, when top-worked on hardy stocks, fruit can be had from all these varieties. Usually, however, even when thus managed, the fruit is not so large—though often quite as good—as when grown under more favorable conditions of climate. The three varieties of all-winter fruit, which I have myself selected for top-working, to secure apples for home use, are Blue Pearmain, Westfield Seek-no-Further and Talman's Sweet.

I feel perfectly sure that we now have a list of entirely hardy Apples—as given in my second article—that justify orchard setting on a large scale in the "cold belt" with a view to profit. With all disadvantages, there are some very great advantages to the orchardist living in this section. Chief among these is that it will be many years before he will have to suffer from home competition. In the section where I live, apples brought from below by rail, are of quick sale, even in such great fruit years as 1878, at $1 50 per barrel. This is the lowest rate at which a medium grade of winter apples is now selling, direct from the cars, at the depot in sight from my window and within half a mile of my orchard. All my own fruit was marketed long ago, none of it at less than $1 per bushel, and home-grown apples will always have the preference with buyers here at certainly 50 cents a barrel over those from below. My Fameuse all went quickly at $3 25. This is a variety not grown further south in shipping quantities. I think the Wealthy will bring the same, and so will Clyde Beauty; while Magog Red Streak, Scott's Winter and Ben Davis go freely at $2 to $2 50—this, in the face of a fierce southern competition with apples bought in the orchard for fifty cents a barrel.

In ordinary years, when southern New England has but a moderate surplus, we have no competition except with Michigan fruit. Then we have no difficulty in getting $4 for Fameuse, or any kind of equal quality, while the next grade sells readily at $3. Now, as out of this there is no freight or commission to pay, and no risk to run, it is plain that, if we are secure in not losing our trees in hard winters, we have really a great advantage over southern and western competitors. My own orchard of over 1400 trees is now rapidly coming into bearing. It has, in the last 12 years, passed through some of the hardest winters ever known in this section, yet it is apparently as healthy and thrifty as any orchard in central New York. Meantime but few of my neighbors have been persuaded to plant trees. There are, in fact but four or five orchards in the county, that sell any apples, or will be able to do so for many years. The farmers have been so discouraged by their failure with southern and western-grown trees brought around by peddlers, that they will not even try, now, to raise an orchard. This state of things will be found to exist almost everywhere in the "cold belt," and therefore I say that he who *does* go into orcharding there with energy, perseverance, and an understanding of the necessary conditions and the right varieties, cannot fail to find the business a profitable one.

A SEEDLING CRAB.—A correspondent from the neighboring city of Brooklyn, referring to our cut and description of the Lady Elgin Crab, in RURAL for November 16, and to the remarks thereon quoted from J. J. Thomas, sends us a specimen of a nameless seedling crab, which he says is of very good quality; it keeps until February or March while the tree is a vigorous grower and very productive. The specimen sent has been kept in a basket since picked on the first of October, and cannot therefore be as handsome now as when first plucked, yet we do not know of a handsomer apple. Otherwise, however, it is not superior to many of its class. The shape is roundish-oblong, the fruit large for its kind.

Arboricultural.

EVERY-DAY NOTES.

SAMUEL PARSONS.

THE CLIMBING HYDRANGEA.—SCHIZOPHRAGMA HYDRANGEOIDES.

CONSIDERABLE expectations have arisen concerning this new climber. Possibly also these expectations have been exaggerated by incorrect reference to the charms of Hydrangea paniculata grandiflora, charms that have dimmed by comparison the beauties of other Hydrangeas. The conception of a Climbing Hydrangea, with great white or pink flower trusses 18 inches long enveloping the front of a building, rather startles the imagination. But the correct statement that the plant in question

has a poorer truss, with sterile flowers less showy than those of H. paniculata grandiflora, should moderate any excessive expectations. After all, we know of no one who has flowered the Climbing Hydrangea in America, and certainly, in other respects, our knowledge of its behavior is small. Seed has been imported within a few years, for the first time, from Japan, and a few plants exist. We have some small plants ourselves, and Messrs. W. S. Clark, C. S. Sargent and P. Henderson have others. It seems to us premature, therefore, to decide as yet on its merits. The foliage is attractive, and, judging from descriptions of eye-witnesses of its beauty in Japan when in bloom, its value must be considerable. With us it grows slowly at first, like the Wistaria, until it attains well-established, strong roots, when its development is rapid. Its propagation from seeds or cuttings is easy, and it seems, after the trial of several years, to be perfectly hardy. Mr. Peter Henderson has a variety that differs somewhat from ours in habit and growth of leaf, but it is doubtless the same thing, showing merely the ordinary tendency to vary. Although it is too soon to give an opinion concerning the value of this climber, I feel confident that it will yet prove a fine ornamental flowering vine for America. Our need, moreover, for more good hardy flowering climbers has been frequently felt and expressed.

CERCIDOPHYLLUM JAPONICUM.

This very rare and choice tree was, as far as I can learn, first introduced to America by Mr. Thomas Hogg, who sent it from Japan to his brother, Mr. J. Hogg, of New York, at least as early as 1863. This very tree stands in Mr. Hogg's garden at Harlem to-day; and its ornamental value, as there indicated, is very great. The outline is pyramidal and the foliage rich, glossy and beautiful, resembling the heart-shaped leaves of the Japan Judas tree, only smaller. Indeed, we may reasonably expect that the attractions of the Cercidophyllum will, in time, gain for it among deciduous trees a reputation similar to that possessed by the Japan Judas tree among shrubs. At present, however, it is almost, if not entirely, unattainable in this country. Practically it cannot be grown from cuttings, and little or no seed seems to have been sent from Japan. An anomalous tree, its relations with other plants are peculiar; for, though said to be of the Magnoliaceæ, it cannot apparently be grafted on any stock known in America.

THE UMBRELLA PINE.—SCIADOPITYS VERTICILLATA.

This evergreen is, in many ways, the most curious plant ever brought from Japan, and it will probably long remain as choice as it is curious. Even in Japan it is highly prized and planted in conspicuous positions. Indeed, it must present a truly elegant and remarkable appearance when a hundred feet high. R. Fortune and other travelers speak decidedly as to its reaching this hight, although so great an authority as Siebold says it "grows 12 or 15 feet high." Doubtless, the last authority refers to ordinary garden specimens. (See illustration in RURAL of Nov. 24, '77.) The Umbrella Pine seems to be truly *sui generis*, allied closely to no other conifer, although it has been variously termed Taxus, Podocarpus, etc. Indeed nothing, perhaps, could be found among plants more strikingly peculiar than the formal parasols of 30 or 40 stiff leaves, or broad glossy, green, flattened needles, that push forward every year. Curiously, also, these leaves drop only once in three or four years. Can anything be more anomalous? And then, to increase its attraction, it is rare, difficult to propagate, and hardy.

As to its rarity, I can only say that I doubt whether there are in America a dozen Sciadopitys verticillata over four feet high; and I believe this estimate of a dozen to be large. Seedlings a few inches high there may be in considerable numbers. It should be said at once that the rarity of the Sciadopitys arises chiefly from the fact that it is very difficult to propagate. In fact, no stock has been discovered on which it will graft successfully, and to grow it from cuttings is a slow and very unsatisfactory process—a peculiarity that applies to most hard-wooded, slow-growing trees. Seed, therefore, is the only practical means for its propagation. But unfortunately seed can seldom be imported from Japan without becoming rancid, or that are not, for some reason sterile. As a matter of course, we gather no seed in America from plants two or three feet high. We have two or three times imported Sciadopitys seed to Flushing in considerable quantity; first through Dr. Hall, in March, 1862, and then through Mr. Thomas Hogg in 1875. From the first lot we obtained very few plants, but from the second, of about the same size, we were fortunate enough to secure something over a thousand. These are perfectly healthy, yet they have scarcely grown three or four inches in as many years. When they do begin growing, however, we expect them to come on with some rapidity. But, in the meantime, during many years we must obtain all Sciadopitys of any size from Europe or Japan, and importation from Japan is at least hazardous. Nevertheless, an increased demand might develop a more careful and skillful culture, and thus enable us to have Sciadopitys several feet high, sooner than we now conceive possible.

Miscellaneous.

NOT AS REPRESENTED.

EDITOR RURAL NEW YORKER:—Since writing you a few days ago concerning the dilatory movements of C. H. Spaulding, I have just received the Mendelssohn piano, and I must say I had just as soon he had cheated me by not sending it, as to have insulted me by keeping the money and sending such a poor substitute. He advertised that the keys were covered with ivory, instead of which I find glazed pasteboard; also that he would send $1,50 worth of music, and he has sent none. Altogether, it is the greatest swindle, or misrepresentation I have ever seen. The instrument itself is perfectly worthless. A toy piano for children sold in town this winter at $1 50, was infinitely superior. I really would not have given 50 cents for it. Besides paying $2 freight, I sent $5, which makes $7 I have paid to own something I thought would be of value to the children to learn music on. It is as near nothing as anything in the musical order I ever saw. Indeed, I would rather have a 10-cent harmonica. I really hope if you keep the advertisement in your paper, that you will offer no other inducement to our country friends to purchase one, for I know they would be even more put out than I am after getting it. I don't mind paying double the value of anything (so far as I am able), if it suits me, but it becomes an abomination if I pay three times the value and it falls so far short. This is a truthful statement, and I am sorry to make it known, but as my husband says, "I may acknowledge myself stuck" in making such a bad bargain.

But enough of that. I would like to make some inquiries concerning some things in which I believe I shall be dealt honestly by—tell me where to procure some of the Chufas I see spoken of in the RURAL of Dec. 28th, and at what price; also where to procure some of the Hubbard, or Butman Squashes, and again, please inform me where I could get a pair of Angora goats, at what price, and whether it would be advantageous to raise them in this part of the country; also, please send me a few of the Beauty of Hebron potatoes the first favorable weather? MRS. T. L. LAMB.

Williamston, N. C.

[We thank our correspondent for writing us the facts. We exercise unusual care in editing our advertisements, but, despite this, it will sometimes occur that misrepresentations are made, and in the case of out-of-town firms, we must rely for our information on our friends, if we have any, in the advertiser's place of residence. The advertisement here referred to, will never be permitted to appear in our columns again. Information concerning Hubbard squash is to be had by looking over our seed advertisements. We will be happy to send Beauty of Hebron. (See our seed announcement.) The inquiry relative to goats will be answered later.—EDS.]

CATALOGUES, &c., RECEIVED.

STOCK-BREEDING: A Practical Treatise on the Application of the Laws of Development and Heredity to the Improvement and Breeding of Domestic Animals. By Manly Miles, M. D. New York, Appleton & Co.

This is a timely publication and more than realizes the modest claims put forward in its behalf by the author. Now when a general interest has been aroused throughout the country in the improvement of stock of all kinds; when a fresh market has been opened across the Atlantic not only for prime beef, mutton and pork, but also for good horses, cattle, sheep, and even swine; when at home professional breeders find their largest profits in the production of first-class stock, and intelligent dairymen realize that their best hopes of success depend on the possession of pure-bred herds or their grades: when every gentleman with a country residence is proud of the possession of a few choice animals and entertains high hopes of their progeny, a hand-book of authentic information on systematic and scientific breeding is sure to receive a general welcome so soon as its merits become known. Until the publication of the present work, despite the importance of live-stock to the agricultural interests of the country and the marvelous improvements made in it within the last century, no work has been accessible to the farmer in which the known facts and principles of the art of breeding our domestic animals with a view to their improvement were presented in a systematic and convenient form. In the manual before us, no pretentious are made to original discovery in the art of breeding, but under eighteen general headings all the leading facts bearing on the subject are systematically grouped together, plain inferences are drawn therefrom, and all the evidences extant in support of these conclusions are classified and arranged in a lucid and forcible manner. As a result of this method of treatment, the reader, having before him all the data on each branch of the subject, is in a position to do his own thinking and to form an intelligent opinion for himself.

The scope of the work includes every department of knowledge bearing upon the art of breeding, as can be seen by the following list of topics treated of in the different chapters: Breeding as an Art; Heredity of Normal Character; Heredity of Disease; Heredity of Acquired and Abnormal Characters; Atavism; Law of Correlation; Variations; Fecundity; In-and-in Breeding—an excellent chapter—; Cross-Breeding; Relative influence of Parents; Influence of a Previous Impregnation; Intra-Uterine Influences; Sex; Pedigree; Form of Animals as an Index of Quality; Selection; Period of Gestation. These subjects are all handled very fully and so clearly as to be easily comprehended by anyone possessed of ordinary capacity and education. This lucidity of style adds so largely to the interest of the book that, by force of contrast, the reader is pretty sure to regret its absence in many other works of a like semi-scientific nature.

Probably the most notable feature of the book is its copious wealth of citations from eminent authorities who have written on different phases of the questions therein discussed. Among so many quotations it is not unlikely that the intelligent reader will find some whose force is somewhat weakened to his mind either through doubts of the entire truth of the uncorroborated statements they contain, or on account of their occasional indirectness of relevancy to the point they are put forward to support; yet, taken all together, they excite a very lively interest as illustrations of the various facts related, the inferences drawn from them and the researches and discoveries made in a very attractive and useful department of knowledge.

A source of possible error, however, in this connection should be referred to. Too much importance may be assigned to the facts recorded in many of these citations. For instance, in the chapter devoted to heredity of diseases, we are told that Lucas says: "A blind beggar was the father of four sons and a daughter, all blind." Now such an occurrence must have been extremely exceptional among blind people, possibly as rare as among the progeny of parents blessed with excellent sight. It was the singularity of the fact that caused its record. Moreover, its value as an instance of the influence of heredity is greatly lessened by a lack of information concerning the cause of the parent's blindness. This might have been the result of disease, transmissible by infection to children, in which case the children might have been born blind the disease that caused the father's calamity having had a similar effect on his progeny. This case is here mentioned merely as a very prominent specimen of the faulty character of no a few of the quotations.

Such a work as this was greatly needed and consequently it supplies a want which thousands of farmers must have often felt. Indeed, it is probable that it will be of more use to farmers generally than to professional breeders; for most of these must be already acquainted with the principles it teaches, though not with the evidences with which it supports them. To farmers, however, it will afford valuable instruction which will guide them to a correct estimate of the amount of truth in the various articles they may read on the subject of breeding stock with a view to its improvement, besides putting them in possession of the best condensed information on that important topic. The book is an excellent specimen of the typographical art, its price places it within the reach of every farmer in the land, and we have lately seen no work we can more heartily recommend to our readers.

PETER HENDERSON & Co., 35 Cortlandt St., N. Y. Catalogue of Everything for the Garden. This is one of the largest catalogues we have ever seen and, in simple justice, we may add one of the most comprehensive. It comprises 182 pages, nearly 200 illustrations, and two colored plates. One of these represents a red-and-white-striped Tea Rose called American Banner, a name which is appropriate, not to say patriotic. We trust it may prove less disappointing than did the much-talked-of Beauty of Glazenwood sent out by some of our florists several years ago. The other colored plate presents several portraits of Lettuce, Radishes and Golden Dwarf and London Red Celery. Of the latter we shall have occasion to speak before another planting season arrives. Not to be behind in anything, Mr. Henderson offers for the first time a new seedling potato—also appropriately and Patrickotically named, St. Patrick. Mr. H. thinks that St. Patrick is perfect and charges for it accordingly, 75 cents per pound, or $6 per peck. Have you tested the Beauty of Hebron, Mr. Henderson? If not, how can you be confident that he (St. Patrick we mean) is superior to her (Beauty of Hebron)? The catalogue gives also a fine engraving of Pearl Millet, which, however, does not so truly represent the manner of its growth in this climate as does our own engraving to which we have often referred. The results of his experiments, also, are so entirely different from ours that either our best plants were much inferior to his *average* growth, or else Mr. Henderson is mistaken in his notes as to dates, rapidity of growth, hight of stem, etc. For instance, he states: "After cutting, a second growth started, and was cut August 15th—45 days from time of first cutting. *Its hight was nine feet.*" Now the highest stalk of our *best* plant which had not been cut down at all, measured, after frost, but ten feet one inch. But as to the catalogue, we have only to add it offers a long list of novelties, and as long a list of all other plants as anybody need desire to select from. We advise our friends to send for it.

THE LAWSON COMPANY'S CATALOGUE. Edinburgh and London. Among the novelties offered by this old and trustworthy English house we note the following for the benefit of our seedsmen and those amateurs who are in haste to purchase new things without regard to cost:

Primula sinensis fimbriata. This beautiful new variety was selected from a superb strain. Its foliage is of a dark green shade, the stalks of the leaves and flowers almost black, and contrasting beautifully with the fine, large, well-developed white flowers; sometimes blotched with crimson; very distinct.

Petunia hybrida nana compacta multiflora. An improved and highly recommended dwarf Petunia of the *inimitable* type; very dwarf, bushy habit, and densely covered with brilliant cherry-red flowers, each bearing a white star. Will be of great value as a market and bedding plant.

Xeranthemum annuum superbissimum. A very double improved variety, with perfectly globular-shaped flowers, and entirely free from projecting marginal ray florets; it is said to be the most perfect Xeranthemum yet obtained, and is indispensable for dried-flower works.

Solanum hybridum Empress This fine variety, of recent introduction, is very valuable for decorative purposes; the compact, bushy plant, richly covered with coral-red berries, is a great improvement on all former varieties.

Lychnis Haageana atrosanguinea. Introduced as a most brilliantly colored variety of robust growth, yielding flowers of an intensely rich blood-red color, forming a fine contrast with the dark glossy foliage.

Primula sinensis fimbriata. Another splendid new variety, of compact habit, and forming a perfect cone; it blooms very freely, the flowers being of a brilliant scarlet color.

BULLETIN OF THE NATIONAL ASSOCIATION OF WOOL MANUFACTURERS. This neat pamphlet of 254 pages contains an instructive address, covering 182 pages, by John L. Hayes, L. L. D. the well known secretary of the Association, delivered before the National Agricultural Congress at New Haven Conn, on the 29th of August 1878, on the resources of the United States for sheep husbandry and wool manufacture also an interesting, eleven-page report by E. Ollendorff, late Commissioner of Agriculture in the Argentine Republic, on sheep husbandry and wool production in that State; likewise the proceedings of the Association at its fourteenth annual meeting held in this city in October 1878, together with several other items of minor importance. The work is well edited by Mr. Hayes, and in a future issue we shall take occasion to refer to the fund of information on the wool growing interest of the world, which it contains.

VICK'S FLORAL GUIDE FOR 1879: It is, as usual, filled with fine and faithful illustrations. First, we have a colored plate of a group of Pæonies; then Instructions as to selection and sowing of seeds, lawn making, bedding plants and carpet beds; then garden adornments, balcony gardening, window boxes, etc. We have next a careful Alphabetical Index—a feature the value of which is not sufficiently estimated in the average seedsman's catalogue—and, finally, the usual lists of all sorts of seeds for the florist, gardener and farmer. Mr. Vick's address, which we should suppose would be well known to all of our readers, is Rochester, N. Y.

WM. H. CARSON. List of novelties and abridged catalogue of farm and garden seeds for 1879. In this we find a reduced cut of our Pearl Millet, of which Mr. Carson can claim to be the re-introducer to Northern farmers. Many testimonials from different parts of the country concur in praising its value as a fodder plant. He also offers Teosinte of which we gave an illustration in RURAL of Nov. 2; Prickly Comfrey, Chufas; many new varieties of farm seeds and vegetables. This catalogue will be sent to applicants.

R. H. ALLEN & Co., 189 and 191 Water St., New York. Seed Catalogue. Among root specialties Webb's New Kinver Yellow Globe is again advertised by this house. It is a new

English variety that is said to have produced enormous crops. It has been grown, Mr. Alleu says, by leading stock growers who inform him that its excellent qualities are fully maintained here.

P. K. DEDERICK & Co., of Albany, makers of the Perpetual Hay-press, send us a very interesting pamphlet containing the complete history of their patents, with fac-similes of the patents and specifications themselves. The book is free to anyone caring to send for it, and it will be found well worth perusal.

G. L. ANTHONY, Greensboro N. C. Descriptive catalogue of fruit and ornamental trees, grape-vines, small fruits &c.

L. W. GOODELL, Amherst, Mass. An illustrated catalogue of flower and vegetable seeds. Free to applicants.

GARDENING Guide. Wm. H. Spooner, Boston, Mass.

WHAT OTHRS SAY.

A REMEDY FOR THE PHYLLOXERA.—*La Gazette des Campagnes* says that an efficient means of destroying the Phylloxera has been discovered and has obtained a marvelous success. Apply lime-milk to the branches and heads of the vine during the winter, and by means of this process the egg, which is the real germ of this insect, will be destroyed.

AT THE STATE FARM (Monson, Mass.), the cows are milked precisely at 5 A. M. and 5 P. M., and each cow's milk is weighed and the weight recorded. The record shows that 55 cows gave, in one week in June, 2¾ tons of milk, and in one week in December 2¼ tons of milk. The whole amount of milk produced during last year was a little over 120 tons. Seven cows have given an average of about 20 quarts of milk each per day.

The winter feed for the milch cows is dry hay before milking at 5 A. M., and about 8 A. M. a bushel basket of cut hay and corn stalks wet with warm water in winter, and mixed with 2½ quarts of wheat bran for each cow. At noon they are fed with a peck of turnips or mangolds for each cow, and at night the same feed as the morning, thus making five meals per day from 5 A. M. to 7 P. M., at regular intervals.

A DOMESTICATED QUAIL.—We are not accustomed to associate the quail with domestic pets, and yet, according to the London Gazette, there is one of these timorous and by no means common birds running about the kitchen attached to Mr. Wildsmith's cottage at Heckfield, as unconcerned as though it were a tame starling or jackdaw. It was reared by a bantam hen, and is now four months old, and is almost full-grown. It perches upon the back of the dog, and creeps into the shelter of his body when lying down. It is also on good terms with the cat, and fears no stranger, but makes itself quite at home with every one. This unusual associate of the domestic fireside evidences what may be done by care and kindness, whilst the pleasure taken in its society by the dog and cat shows that even these game-loving animals are not always so black as they are sometimes painted.

THE ENORMOUS CROPS OF 1878.—The December Report of the Department of Agriculture just published at Washington, gives the latest estimates of the past year's crops throughout the country corrected down to the first of the month. The following summary of it will show how closely it approximates to the figures on the subject we placed before our readers during the fall. According to the Report, the corn crop for 1878 is some 30,000,000 bushels larger than that of 1877. The oat crop is somewhat in excess of that of 1877, making it the largest ever raised in this country. The average yield per acre is, however, less than in 1877, and the quality in most of the States is inferior. There is no material change in the barley crop from 1877, except that California increased her acreage from 450,000 to 650,000 acres, and almost doubled her yield per acre. The total product for the year will be in round numbers 42,000,000 bushels against 34,500,000 bushels in 1877. The rye crop is about one-sixth larger than in 1877, but the quality of the crop is inferior in the New England (except Connecticut) and Southern States, while in the States of the West, Northwest and Pacific slope it is superior, except in Illinois and Nebraska. The potato crop shows a large decline as compared with 1877, though the average area was about the same, the difference being less than one per cent. The average yield of the whole country will be 60 bushels per acre against 94 bushels in 1877, making a total product in round numbers of 124,000,000 bushels for 1878, against 170,000,000 in 1877. The hay crop is 20 per cent. greater than last year. Sorghum is receiving increased attention, especially in the trans-Mississippi States and Territories. In Stearns County, Minn., the variety called Amber Cane is reported as yielding as high as 300 gallons of syrup per acre. Delaware County, Iowa, manufactured 100,000 gallons of syrup during the year, and found a home demand for the whole. The tobacco crop is larger and exceptionally good.

THE WHEAT SUPPLY OF THE WORLD.—The following calculation has been made by a trustworthy French journal, the *Bulletin des Halles*, as to the wheat crops of the principal countries in and out of Europe:

Country.	Average crop.	Estimated crops in 1878.
Europe.	Bushels.	Bushels.
France	281,325,000	226,875,000
Russia	220,000,000	214,500,000
Germany	121,000,000	123,750,000
Spain	115,500,000	110,000,000
Italy	107,250,000	104,500,000
Austria-Hungary	101,750,000	110,000,000
Great Britain	101,750,000	101,750,000
Turkey in Europe	41,250,000	38,500,000
Roumania	33,000,000	37,950,000
Belgium	23,375,000	23,375,000
Portugal	8,250,000	8,250,000
Greece	4,950,000	4,812,500
Servia	4,125,000	3,850,000
Denmark	2,750,000	2,750,000
Sweden	2,337,500	2,337,000
Switzerland	2,337,500	1,870,000
Norway	270,000	270,000
Miscellaneous	540,000	540,000
	1,171,780,000	1,115,880,000
Out of Europe.		
The United States	302,500,000	330,000,000
Algeria	24,700,000	21,625,000
Canada	16,500,000	16,500,000
Australia	16,500,000	16,500,000
Egypt	16,500,000	11,000,000
Miscellaneous	8,250,000	8,250,000
	384,950,000	403,875,000
General totals	1,556,710,000	1,519,755,000

The first column in the following table, taken from the same source, shows the countries which do not grow enough wheat for domestic consumption and the amount required to make up the deficiency; while the second column tells the sources from which this is drawn and the quantity which can be supplied by each:

Country.	Estimated imports.	Estimated exports.
Europe.	Bushels.	Bushels.
France	55,000,000	....
Russia	....	44,000,000
Germany	....	....
Spain	....	....
Italy	8,250,000	....
Austria-Hungary	....	17,875,000
Great Britain	96,250,000	....
Turkey in Europe	....	....
Roumania	....	5,500,000
Belgium	2,750,000	....
Portugal	1,375,000	....
Greece	....	....
Servia	....	....
Denmark	....	1,375,000
Sweden	550,000	....
Switzerland	8,250,000	....
Norway	1,110,000	....
Miscellaneous	....	....
	173,535,000	68,750,000
Out of Europe.		
The United States	....	110,000,000
Algeria	1,375,000	....
Canada	....	2,450,000
Australia	....	2,750,000
Egypt	....	....
Miscellaneous	....	....
	1,375,000	115,500,000
General totals	174,910,000	184,250,000

According to these returns, England and France, the only countries which import wheat upon a large scale, grew last year about 150,000,000 bushels less than they will require for their consumption; and it will be seen that Russia and the United States are in a position to export about 154,000,000 bushels, or about the quantity which the two former countries want. According to our most reliable estimates, however, the wheat crop of this country is here considerably underestimated.

The Herdsman.

CARE OF DOMESTIC ANIMALS.

The present cold weather calls upon the owners of domestic animals to give them extra attention. To begin with, there should be no "cracks in the barn." A man of order and ingenuity will find a remedy for such defects. In extremely cold weather the animals should be cared for earlier in the morning than usual. Curry and brush the horses a little longer, and don't fail to card the cows. Cattle ought to have access to the sunshine, which they naturally seek if they have the chance. Horses do better if they are exercised daily, but they need good care after it. It is common to see a man tie his horse to a post, toss an old robe over his back, and then leave him for an hour or longer. In a few minutes the animal becomes restless, and in moving about the robe is thrown under foot. Every owner of a horse ought to own a good blanket that can be fastened around the breast of the animal, where protection is needed most. Act upon this precaution, and tie the horse so that he will *not* face the wind, and he will be saved much discomfort and perhaps more serious trouble.

Pigs are often allowed to suffer in winter, as well as in summer. I do not know why, unless it is because they are pigs. Give them a comfortable pen with plenty of bedding, and a yard to run in, and see how clean a pig can keep itself. Prejudice ought not to make this somewhat repulsive animal an object of neglect. Chickens need especial care in very cold weather. Give them food and water early in the morning. As soon as the water in the drinking vessel is frozen over, empty and fill again. Feed grain—a variety of it—and raw meat. A large bone with the meat left on will answer. Put an ear or two of corn with the shelled, to afford exercise for the chickens. Chickens like to pick for themselves, but in winter must be furnished with the material for doing so.

All who own animals should pay them a visit just before retiring at night, to see that they are comfortable. Do not enter a barn while smoking a pipe or cigar. If necessary to carry a lantern, hang it in a safe place while re-arranging bedding, etc. Every member of a family—ladies as well as gentlemen—ought to know how to feed and care for the animals kept. They often suffer through inattention on the part of persons hired to take care of them. Look well to the live stock; it will pay in dollars and cents, besides cultivating feelings of kindness and humanity. M. G. R.

Lyons, Iowa.

Industrial Societies.

MEETING OF NEW JERSEY STATE HORTICULTURAL SOCIETY.

THE Fourth Annual Meeting of the New Jersey State Horticultural Society was held in the city of New Brunswick, N. J., on the 15th and 16th insts., with a fair attendance. The tables contained a fine collection of forty varieties of apples, several pots of choice plants, and vases of cut-flowers, including Camellias, Orchids, etc., and a very interesting exhibit of Florida products, consisting of the famous Indian River oranges, lemons, limes, citrons, fresh as well as dried and preserved, guava jelly, guava canned, and guava and orange marmalade. These were grown, manufactured and exhibited by the Secretary, Rev. H. S. Williams, of Rock Ledge, Fla., and presented as a New Year's *souvenir* to the fellow horticulturists of his native State. These guava and citron products, being the first successful experiments as far as we know in this country, excited a good deal of interest from all present, and the committee of examination compared them critically with the imported articles, and found them decidedly superior in every respect, retaining more of the natural flavor of the fruit, thus adding another to the long list of home industries. The oranges, also, were pronounced much sweeter and finer than the Florida oranges usually found in our markets.

The Fruit Committee reported much less pear blight than usual. The May frosts did much damage, especially to the huckleberry and nut crops, the former being almost entirely destroyed. The new Strawberries, Great American, Beauty, and Pioneer, were placed on the New York market in sufficient quantities for dealers to test their merits as market fruits. They were all transported by wagon 12 miles, and stood the journey well. Their large size and attractive appearance created a demand for them at 40 to 75 cents per quart, but liberal culture is absolutely necessary to secure such results. The Beauty, for quality, was considered a better table fruit than the Great American, while some amateurs regard the Pioneer, as a family berry, hard to be beat.

The Brandywine Raspberry, owing to its high color and good carrying qualities—its chief merits—was in good demand and sold well. A new Raspberry, the Montclair, had been carefully examined, and was pronounced as large as the Antwerp, rather darker, slightly acid, with a peculiar aroma. Mr. Frost, one of the oldest dealers, thought "it one of the best he ever tasted." Mr. Archdeacon liked it for its solidity and fine flavor, and if it proved to be a good keeper, it would, in his opinion, be a valuable addition to the list.

On vegetables the committee reported the potato to be the most important; and the Early Rose the standard for quality and profit, though some had found the Peerless quite as profitable at lower prices, owing to its great yield. It is known that Vermont and Late Rose are often sold as Early Rose on the reputation of that variety. Large quantities of potatoes had found their way to our markets from Missouri, Michigan, Minnesota and Canada, and if these brought a profit to the grower, Jerseymen ought to take courage.

An instance of training tomatoes on trellises was reported where the yield of good, salable fruit was more than double that from an equal number of plants allowed to trail on the ground. Another case was mentioned of a market gardener who trained several hundred plants to stakes; the fruit ripening 10 days earlier than on plants allowed to lie on the ground, and were free from dirt and wire worms.

Discussions on the varieties of apples for profit in New Jersey; the best evergreens for orchard windbreaks; the revision of the Society's catalogue, and experience with new fruits, brought out a good deal of information. These, with a paper on roots, and a lecture on fertilizers, kept the interest unabated till the close of the sessions, notwithstanding the severe snow storm on the last day.

A proposal to hold a strawberry exhibit in Newark in June, was regarded with favor and referred to the Executive Committee. A Newark gentleman invited the Society to hold its next annual meeting in that city, and offered a Hall for the purpose, which was finally accepted with thanks. Now that the Society has made a new departure, it is thought by many that its membership and usefulness will be largely increased,—*nous verrons*. The old officers, with few exceptions, were reelected. George Such, So. Amboy, President; E. Williams, Montclair, Rec. Secretary; B. B. Hance, Red Bank, Cor. Secretary: W. H. Goldsmith, Newark, Treasurer.

THE ONONDAGA COUNTY, N. Y., AGRICULCULTURAL SOCIETY.

THE annual meeting and winter exhibition of the above Society was held in Syracuse, January 8th, 1878.

The officers elected were the following:

President—Edward A. Powell. Vice-President—Edward B. Judson. Secretary—Patrick H. Agan. Treasurer—Warren C. Brayton. Trustees—George Butts, Wm. H. Gifford, Alva W. Palmer, James R. Brown, Thomas Andrews, John Wells.

The display of fruits, flowers, grain, roots, etc., was exceptionally fine.

Of thirty prizes offered for the best displays of different varieties of apples, we notice friend Nelson Ritter bore away seven.

THE PENNSYLVANIA DAIRYMEN'S ASSOCIATION will hold its annual Convention at the Court House, in Meadville, on Wednesday and Thursday Feb. 5 and 6. On the first day, in the forenoon, President A. M. Fuller will make an address on the "Commercial Aspect of the Dairy;" and Prof. G. E. Morrow, Dean of the Illinois College of Agriculture and one of our contributors, will speak of "Western Dairying and its influence upon Eastern Markets." In the evening Hon. Harris Lewis will tell about the proper "Care and Management of Dairy Stock." On Thursday forenoon S. A. Faringdon will report on the International Dairy Fair, and our friend, Prof. E. W. Stewart, will discuss "Dairy Buildings and Management." Reports of the Secretary and Treasurer; reports on several dairy subjects; election of officers, addresses by visiting friends and social gatherings will profitably and pleasantly occupy the rest of the time.

Industrial Implements.

CLARK'S ROOT-CUTTER.

A VERY simple, cheap and strong root-cutter is shown in our engraving, which we have had drawn from the original, made by the Higganum Manufacturing Corp. at Higganum, Conn., under Clark's patent. A piece of the frame is broken away to show the mechanism, which consists of twenty-five gouge-shaped steel knives arranged on a wrought-iron shaft that

holds them securely. The roots are well and expeditiously cut at a small expenditure of power, and the oak-frame, firmly bolted together, affords substantial resistance to wear and tear. Its low price puts it within the reach of all who can appreciate the importance of root-feeding. Circulars may be had by addressing the company mentioned.

A NEW HAY KNIFE has recently been doing good service at our Experiment Farm, and we take pleasure in referring our readers to the advertisement of the knife on the thirteenth page of this issue. It will be seen to differ from the ordinary knife in shape and cutting-edge; the notch only is sharp, and goes through the hay with very little expenditure of muscle, and in pulling out, as the cutting-edge does not draw against the hay, the knife remains sharp much longer. If the notches were a little deeper it might be an improvement, it seems to us. The knife is said to be also admirable in bogs, cutting corn-stalks, ditching marshes, etc.; we think it likely, though this we have not had a good opportunity of testing. Altogether, however, it is a handy thing to have around the barn.

Industrial Topics.

A COUNTRY SCHOOL HOUSE.—No. 1.

PROFESSOR W. J. BEAL.

In many cases the location is a desirable one, situated on a slight elevation near a good road in a central portion of the district. In too many instances the house is built on a piece of low land, back from the main road, perhaps in the edge of the woods or more likely away from any trees. There is a little corner of half an acre, or less, cut off from a field. The lot is generally destitute of a fence, and open to the frequent visits of cattle, sheep, and perhaps swine. These animals keep the turf closely pastured, but otherwise damage the appearance of the yard. The land is rough and ungraded, just as Nature left it, except the removal of all or a part of the trees. The stones are scattered about, if stones are common in that locality. Stumps and logs are plentiful, unless the country is old.

Toward the rear of the lot are a couple of out-buildings much dilapidated, on account of frequent beatings by sundry stones and sticks thrown by mischievous boys. Several portions of the main building, especially at the front, are badly damaged by hard usage. In several places, scattered over the lot, are piles of stove-wood and numerous sticks are strewn about in great confusion. Good order may be displayed in a wood-pile as well as in anything else. A mud puddle is situated near the front door. An old board or two serve to keep the feet partially out of the mud. If we enter the room, we shall not be disappointed in finding that the inside corresponds with the outside of the house.

If the above description will not answer for most of our country school houses, it answers for too many of them. In a few cases there is an attempt to ornament the grounds by shade trees and other means, though even here usually no good design has been followed.

The effect on teacher, scholars, visitors, and passers-by is anything but inspiring. Suppose the ground were graded even a little, and trees set here and there about. In grading, the surface should be made smooth, but not necessarily level or formally graded down. If cattle run on the road, a neat fence should cut off their approach to the house. Let the teacher with the aid of the scholars, who will cheerfully lend a hand, pick up everything tidily. In summer there should be a few neat flower-beds kept in good order. Shrubbery and perennial herbs should find suitable places. It is no use to say the scholars would not help, or that they would destroy the plants after they were set out. Any one who has tried it knows better.

A word about the house. It is usually planned and built by those ignorant of the business, at least the plans are usually poor. The house is plain and almost always painted white, or sometimes red. I know of one case in which the house is red and the battens are white, or a part of each is white. White, for a country house, is too glaring and conspicuous, presenting too strong a contrast with all the surroundings. I know of many instances where the houses cost enough to be models of excellence. I think of one the walls of which were made of pressed brick. Every seat in the house is so high that hardly any one, except a "six-footer," can sit down squarely and rest his heels on the floor. On my visiting the school, the teacher said there was not a seat in the house low enough for the largest scholar. The seats were narrow and flat, not sloping backwards, and the backs straight up and down. In such places the children are required to sit with feet dangling midway between the seat and the floor, just because some one did not put brains enough into his plan for a house. In most cases the ceiling is tight, a stove supplies the heat, and there is no arrangement for ventilation except by the windows and doors. Sometimes there is no black-board, though generally there is a small one of poor quality in an inconvenient place. In some cases there is no wall under the sills. The cracks in the floor allow cold drafts of air to come up freely through it.

In such forlorn quarters, with no sign of ornament inside or out, children are banished for six hours a day, for several months of the year. Is it a wonder that some of them do not like the school? I hope the above picture is overdrawn, but in the majority of cases with which I am acquainted, I am sorry to say it is not.

Would it not be a good plan to put on a little more style? Why should not the inside of the school-room look as well as the church? This is the case with many of our city schools. Or, again, why should not the school-room be made as attractive as some of the village saloons? Through a poor streak of economy people are employing the cheapest teachers they can get.

When a boy, the writer hated school, but did not know why. It was not pleasant. To the best of his knowledge, the correct reason can be picked out of the foregoing account of our country school houses. There was nothing cheerful in the surroundings; the seats were uncomfortable; the hours were long and too many in each day; the air was impure, the teacher overworked and unskilled in awakening an interest in the studies. The writer liked nature, but disliked books—at least such books as were accessible. The greatest needs of our country are educated voters and educated mothers. With plenty of these there is no danger that the Republic will fail. In future papers I shall try to suggest means for making our country schools more effective.

Agricultural College, Lansing, Mich.

Various.

BEE HINTS.

The apiarian has still but little to do about the bees, further than to see that the proper temperature is maintained (between 35° and 50°), and to ascertain that they do not suffer from dysentery or the ravages of mice. But now is the time to make hives, frames and implements that will be needed during the busy season. Now is also the time to study good works on bee-culture, to familiarize one's-self with the experience of others, to look into the causes of their success or failure. One will thus store up much useful knowledge that will be handy to draw upon when occasion demands.

Oleomargarine.—Of sixteen manufactories of this concoction scattered here and there through the country, thirteen, we learn, have already been closed by the pressure of hard times, though backed with an aggregate capital of $1,800,000, to begin with, and few if any are running at a profit. Among the causes that have contributed to the stagnation in this greasy business not the least influential has been the lack, of late, of the liberal amount of free advertising foolishly accorded it by all our dairy conventions until the Rural entered a vigorous protest against the practice. At the late dairy show in this city the stuff failed to receive a single puff from any speaker, and the underhand trickery by which its manufacturers hoped to profit, like trickery generally, finally proved injurious to the tricksters. They cunningly contrived to introduce a few tubs of the stuff among the butter from distant points, and then loudly boasted that the judges could not detect the imitation from the reality; but in every case the odor of the conglomeration alone betrayed it. Some farmers, too, and even some creameries were, not long since, accustomed to use a good deal of it for the purpose of adulterating their butter; but the public odium and low prices that awaited upon detection, have greatly curtailed this opening for its sale. The curiosity of the general public also with regard to the concoction, has been nearly sated, while the low price of genuine butter of late and the necessary improvement in most of it, are also contributing to the unpopularity of oleomargarine

Chufas, Pearl Millet and Prickley Comfrey.—A correspondent writes us from Hanover Co., Va., that he has tried these three plants during the past year. The two first he considers really valuable farm crops, and is especially impressed in favor of Pearl Millet. If it is not deficient in nutritive elements—and such analyses of it as we have seen assign it a fair amount of nutriment—he will regard it as the grandest forage plant he has ever seen. His patch was from nine to ten feet high and formed a mass of forage 2x9 feet all along the row. He did not cut it for forage, however, but let it seed, lest it should fail to do so certainly and freely if it were cut once and he should depend on the second growth. The Chufas, on moderately good land and with only indifferent culture, yielded at the rate of 154 bushels to the acre, as ascertained by measuring the tubers from a small area of average productiveness. After two years' trial of them, he is quite satisfied that they are a paying crop.

Although the Prickley Comfrey was grown on very rich land, it proved of little use to him and he is about to abandon its culture, thus setting a much lower value on it than another of our correspondents who speaks in praise of it in this issue.

Beauty of Hebron.—The following is what James Veitch & Sons, the well-known London Seedsmen, say of this variety: It is an American introduction, a seedling from the Chilian Red. One of its special features is its luxuriant and rapid growth, the foliage partaking much of the character of that of Early Rose, only somewhat more vigorous. It is a very heavy cropper and early, coming into use three or four days before that variety. The tubers are of handsome Kidney shape, slightly tinged with red around the eyes, of smooth texture and grouped closely round the stalk when growing.

Everywhere.

RURAL SPECIAL REPORTS.

Virginia, Matthews C. H., Matthews Co., Jan. 15th, 1879.—We have the oldest and most thickly settled county in the State. Our population is something like 65 persons to the square mile, and most of our lands have been in cultivation for over a century without manure of any kind, with the exception of the old Virginia rotation—"a crop of pines"—and, strange to say, they still produce something and respond finely to what manure is spread on them. There have been vast quantities of ship-timber and lumber of all kinds cut from this county, and this has caused the agricultural interests to be neglected; but now we are turning our attention to farming and the oyster trade combined. The manner in which we improve our lands is unique; most of the farms lie on the water, and the owners procure fish from the numerous "pounds" and "purse nets," and drop them in the corn rows about two feet apart, using about 30 bushels to the acre. They are covered by the plow and the corn is drilled on top. This application generally produces about eight to twelve barrels to the acre, and I have known twenty-five bushels of wheat to be raised to the acre after the corn crop. The fish cost, at the pound, 20 cts. per flour barrel, and the improvement would be permanent, provided clover and grass seed were sown on the wheat, which is not generally the case. In the fall the oyster crop comes on, and the bivalves command a ready market, and for those having a suitable shore to plant on, the business is a very profitable one. This is the most healthy portion of Virginia. Billious diseases seldom occur, and the low grades of typhoid fever so common in the Piedmont region and West Virginia, are exceptions in this country. Land here is worth from $10 to $40 per acre, according to location and improvements; corn, 50 to 60c. per bushel; wheat, 90c. to $1; eggs, 20c. per doz.; butter, 30c. per pound; oysters, from 50c. to $1.25 per bushel. S. E. R.

Connecticut, North Coventry, Tolland Co., Jan. 16.—All grain crops yielded fairly in this neighborhood; so did grass, and the farmer can find a ready market for all his products at good prices. The corn crop was a trifle below an average, owing to the weather having been too cold when the plant was setting ears. But what the farmer lost in his corn crop, has been well made up to him by others, especially buckwheat, which has been a fine yield—25 to 30 bushels to the acre is considered a fine crop in good soil hereabouts. Buckwheat is now worth 50 cents per bushel; corn, 65c.; oats, 40c.; rye, 75c. Our hay crop was very large and of good quality, and is worth from $12 to $15 per ton at the barn. The potato crop was damaged considerably by the Colorado beetle, so that the tubers are not as abundant hereabouts as usual. They are quoted at $1 per bushel and upwards for the best Early Rose. Apples last season were plentiful, and many a farmer sold his crop for 15c. to 20c. or 25c. a bushel on the trees. Stock growers and dealers are now paying from $25 to $50 per head for good cows, while a few selections from blooded stock are worth more. Working cattle are worth from $100 to $125 per yoke. Fat cattle, dressed, 6½c. to 8c. per pound; hogs, 6c. per pound; good butter, 25c. per pound; eggs, 28c. to 30c. per dozen. Labor is cheap—good help can be obtained for $1 per day, and some few for 80c. a day, boarding themselves. Many of the young men are teaching school, an occupation that pays better than farming—winter term, $25 to $30 per month for 20 days a month. We are having fine winter weather. The wood market is dull; good, hard, dry oak and walnut are worth $5 per solid cord; mixed wood, $4, delivered at the wood-yard. Such wood can be bought upon the lot standing for from 80c. to $1 per cord, solid measure. E. B. T.

Kansas, Everett, Woodson Co., Jan. 11th, 1879.—I have been living in southeastern Kansas something over two years, this being my third winter here. Two of them have been quite cold; the first winter we had about six inches of snow on a level, which lasted about two weeks. This winter has been very severe, the thermometer standing as low as 16° below zero, with about 14 inches of snow on a level, some say two feet. The first snow storm commenced on the 12th and 13th of December, and there has been sleighing since that date. There is little or no frost under the snow, and all our storms of late have been snow storms. I don't know how it is where L. J. Templin lives, but in this vicinity we have to feed stock nearly as much and for nearly the same length of time as we did in northern Illinois, where I came from. "Sunny Kansas" is the theme of nearly every paper nowadays, but persons coming here to live must not expect to find everything as smooth as land agents and R. R. Co.'s picture it. I do not wish the Rural or its readers to infer from these remarks that I do not like Kansas. I have traveled over a considerable extent of the western country, and am well suited with my present location, and I think it is a fine country for new beginners to start, but it is always well to look at both sides of a bargain and then one is not so likely to be dissatisfied in this case as if he pictured the country only one degree below perfection. Good land in this section can be bought as low as $3 per acre, and some 80-acre lots at from $300 to $500; and 160-acre lots at the same rate, the improvements in many cases being worth fully the price asked for the farm. J. J. D.

Indiana, Newton's Retreat, Tippecanoe Co., Jan. 15.—We have had fine sleighing here for the last four weeks, but most of the farmers would be glad if the snow disappeared and the weather moderated, for a great deal of the corn is still in stooks and some even yet standing; but at present there is little prospect of finer weather, for during the last week the thermometer has ranged from 10° above zero to 20° below. Wheat was a good crop here last year; oats, however, were light, owing to the weevil's depredations; corn was an average crop. Prices for all kinds of produce are low, and times are hard. Wheat sells for 88c. per bushel; rye, 40c.; oats, 20c.; corn, 25c.; hay, $6 to $7 per ton; live hogs, $2.80 per cwt.; butter, 12½c. per pound; eggs, 17c. per doz.; potatoes, 40c. per bushel; onions, 40 to 50c. Business is improving slightly, and we hope times will be better in the near future. Tramps are plentiful, with some to spare. Hands on the farm get from $15 to $18 per month. There is plenty of work for those who are willing to do it at good prices. D. C. A.

Ohio, Dayton, Montgomery Co., Jan. 20.—We had, nearly up to Christmas, as nice a fall and winter as I ever remember to have seen, but a day or two before Christmas the cold snap set in, and ever since then the weather has been very cold—old men say the coldest they have ever seen. Potatoes and fruit froze in my cellar, a thing I never saw before. My flowers, kept in my sitting-room, had a very narrow escape, and indeed some of the most tender did get somewhat frosted. Most of my neighbors lost all of their flowers. The thermometer is generally about 20° or 25° below zero in the morning, and that is what we folks out here call cold. C. H.

Utah, Nephi City, Juab Co., Jan. 14.—The weather is very severe in this part of the country. It is snowing heavily now and has been doing just the same for the last four days. The crops hereabouts were very good last season; wheat averaged 20 bushels to the acre; barley, 30 bushels; oats, ditto; potatoes, about 70 bushels—which, of course, showed quite a failure—and they were not good at that. The crops of John Vickers, one of the best farmers in this part of the country, averaged: wheat, 40 bushels per acre; barley, 75 bushels; oats, 52 bushels. J. B. D.

Kansas, Offerle, Edwards Co., Jan'y 19.—We are having one of the coldest winters ever known to white men in Kansas. It has been steadily cold since 12 Dec. The ground is covered thickly with snow and the stockmen are losing heavily, as they have no hay to feed with. A good many of the settlers that came here late last fall are also suffering, for as our winters are generally open and warm, they did not expect such severe weather as that we now are plagued with, and accordingly made little or no preparations against such an unlooked-for visitation. S. H. S.

Michigan, South Lyon, Oakland Co., Jan. 20.—We have had 30 days of good sleighing. Wheat went under the snow with light top and surface spotted by the fly. Corn yielded well; oats, however, turned out light, and potatoes were nearly a failure. Wheat was the largest crop ever harvested in this vicinity; but it was not of so good a quality as the year before. It is worth 87c. per bushel; corn, 40c.; oats, 20c.; potatoes, 50c.; buckwheat, 50c.; live hogs 2.55 per 100lbs; steers, 3c. per pound; butter, 10c.; eggs, 18c. A. B.

Missouri, Louisiana, Pike Co., Jan. 16.—Since my last crop reports we have been having continued severe winter weather for this locality. Early yesterday morning we had our nineteenth snow storm, with rain during most of the day, which is the first rain for a long time. Stock water has been scarce with many, so that animals had to be driven some distance to the larger water courses. Stock generally is doing well where properly sheltered and well fed. This morning the weather is cold and the roads frozen hard. S.

California, Penryn, Placer Co.—The cultivation of the Orange is the one absorbing interest with us now. Our climate and soil have been both thoroughly tested as to their adaptability to its growth, and the result has been beyond all doubt satisfactory, and I should not be surprised if before long, some one of the many friends of the Rural in this section, should send it some fine specimens of oranges grown on the foothills of Placer Co. J. W. B.

CONNECTICUT. Poquonock Bridge, Jan. 21.—The present winter is proving more severe here than the last. Ice, I am told, is being stored in large quantities in the different ice-houses around us. Provisions, excepting potatoes, are low, very low. Potatoes, however, seem to be held back by the farmers for high prices. M. W.

PERSONS are warned against subscribing through one Charles Ed. Williams of Utica, N. Y. Mr. Williams is not an agent of the RURAL NEW-YORKER, and is not authorized to receive any money on its account.

The Queries.

ANSWERS TO CORRESPONDENTS.

Lime as a Fertilizer; Lime and Salt; Lime and Plaster; Hilling and Drilling Potatoes.

Inquirer, Pompey, N. Y., asks: 1. What effect would lime have upon winter wheat or barley, and when should it be applied? 2. Would lime and salt sown on the same crop be injurious to it; which should be sown first, and what time should be allowed to elapse between the two applications? 3. How would lime and plaster agree on grass land? 8. Will potatoes make a larger yield if planted in drills than in rows both ways, and if so, how much more will the yield be?

ANS.—1. The effect of lime is more marked on wheat than on barley, probably because of the longer time in which it can take effect on the former crop. Lime is a direct fertilizer, inasmuch as plants contain more or less lime; and an indirect one, as it helps much to render any undecomposed vegetable matter soluble and fit for plant food; it also helps to dissolve potash that may be held in an unavailable condition in the soil. Its effect on wheat is to stiffen the straw; to hasten the riponing; to produce a clear skin, and a hard berry. It has a marked effect on the clover which is generally seeded with the wheat, and in many localities farmers never think of seeding to clover without having previously dressed the field with forty or fifty bushels of lime per acre in the fall. It is generally applied in the fall; but it is equally effective if spread on the snow in the winter, and this is convenient to be done for several reasons. 2. Lime and salt have no effect upon each other when mixed. Salt is not nearly so effective as lime; for while lime is rarely used without apparent benefit, salt is used frequently without any benefit at all. Salt has much the same kind of effect as lime as regards wheat; but with clover it is rarely of service. Five bushels per acre are generally used, and this amount can never do harm, if it does no good; so that it is perhaps worth trying for the chance of any benefit from it. Salt may be sown with the lime or separately. 3. Plaster consists, in part, of lime, and to mix it with lime would be useless. If lime is needed by the soil, the small quantity of plaster generally used would be insignificant and useless. If plaster (sulphate of lime) is needed, lime would not be a substitute for it. But lime is always used at a season when plaster is not; and although lime may have been used in preparing the ground for a crop, yet plaster may very well be used after the crop has progressed in its growth somewhat. For instance, if the wheat ground has been limed in the fall, plaster may be used with benefit on the young clover when the wheat has been harvested, or in the following spring; and if lime has been used in preparing for corn in the spring, as is often the case, plaster may be found serviceable when sprinkled about the plants when they are eight to twelve inches high, in June. 4. Any crop generally planted in hills will yield more when planted in drills, other things being equal, because more plants per acre can be thus grown, less room being taken up by each plant. The usual difference is about twenty-five per cent.

Treatment of a Tender-footed Horse.

J. E. R., Lamartine, Pa., asks what ails his mare and a remedy for the ailment. She is lame in her fore-feet, and sets them out in front with the toe down and heel up. If she cannot be cured, he inquires whether her condition would injuriously affect her offspring. She has had three very fine colts and will be eight years old in the spring.

ANS.—The peculiar way of holding the foot here mentioned, which is known as *pointing*, does not indicate, as is generally believed, any single disease. It simply shows that there is pain in the back part of the foot. The most common causes of this are corns and navicular disease. A careful examination of the foot, by slightly paring out the angle between the bars and hoof wall and producing a certain amount of pressure on this part with pincers, should decide if corns are the cause of the trouble. If both feet are affected, as we understand from the above, and corns are found, it is probable that side-bones also exist. Disease of the navicular bone is more likely to cause the lameness; but it is often a difficult matter for a person without experience to decide if this is the case. In bad cases there is tenderness in the deep part of the hollow above the heels; tenderness is also shown on striking the middle of the sole with a small hammer, and there is usually considerable contraction of the back part of the hoof. This is a very unsatisfactory disease to treat, and without seeing the animal we could not advise a treatment. In case of corns and side-bones, have the animal shod so that the shoe will not bear on the affected heels; do not allow much paring of the sole, bars or frog in shoeing; have the shoes changed often enough to prevent the horn of the sensitive heels from growing in contact with them. If there is much tenderness, poultice and use hoof ointments and afterwards apply a blister above the hoof but not in the hollow behind the pastern.

It is best not to breed from lame animals, but lamenesses are not always transmitted; this depends greatly on the conformation of the animal and the use to which it is put.

Silk Culture.

G. A. L., Corsicana, Texas, asks. 1, whether there are any records of silk culture in this country; 2, where can he get the materials for starting in the business; and, 3, the name of some work on the subject.

ANS.—Yes, there are in large libraries and sometimes in the hands of those specially interested in such matters, several records of seri-culture in this country. Before the commencement of this century, silk culture was carried on to a considerable extent in Ga., S. C., Va., Pa., Conn., and Mass., but the business was ruined in all these places by the revolutionary war. The southern parts of Ohio, the east of Kentucky, Tennessee and north Georgia, both as regards soil and climate, have been found well adapted to this industry. In 1840 the total product of silk raised in the United States was reported at 61,552lbs, worth $250,000. In 1844 it had risen to 396,790lbs, worth $1,400,000; but in 1850, it had fallen to 14,763lbs, and for the last half-a-dozen years no statistics are given of native silk culture. During the period of the highest production here mentioned, there was a regular mania on the subject, which is sadly remembered by some as the *Morus multicaulis* frenzy. Many lost heavily at the time through investments made in expectations of great returns, but since then silk culture here has been generally carried on only as a pastime. A couple of years ago, however, an enterprising foreigner started in the business in Kansas, but nothing has been heard of him or his undertaking of late. It is also reported that raising silk has been tried successfully in Cal. In 1875 there was in San José one cocoonery with 1,000,000 silk-worms, and at the same time an association for the promotion of silk culture was established in Sanoma Co., and a silk factory in San Francisco. 2. We do not know of any one who has silk-worms, etc., for sale. 3. An excellent description of silkworms and silk culture can be found in the American Naturalist, Vol. 1., 1867.

Squash Bugs, etc.

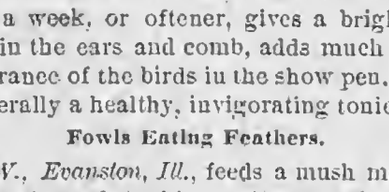
J. S. B., Palmyra, N. Y., wants to know where he can obtain the variety of duck known as Muskoka, described in the RURAL under date of Dec, 28, '78. He also wants to know the variety of corn best suited to the climate and soil of Western New York; and how to raise squashes in a garden infested with the squash-bug.

ANS.—1. Of any of the leading poultrymen, if Muscovy is meant. 2. We shall answer this question in our special corn number, which will be published in a few weeks, better than we can answer it now. 3. The Squash-bugs, Coreus tristis, appear at the same time as the young plants, lay their eggs on the under side of the leaves and live on the juice of the plants. The bugs hide under chips, pieces of boards, etc., that may be found around the vines; hence, by placing such objects about the vines, they will collect under these, and may be gathered and destroyed early every morning during the first part of the summer season. While the plants are still small it is also well to look over the leaves and destroy all eggs that may be found. There is also a Squash Borer, Melittia cucurbitæ, which enters the vine near the root, and often destroys the plant before there are any indications of its presence. To open the vine with a small knife and take out the larva, is the only remedy for this yet discovered, as far as we know.

Making Divisions in a Poultry House.

Ruralist, Walden, N. Y.—In building his third poultry house has utilized the suggestions given on the subject of such structures from time to time in the RURAL. He has placed it in the center of a thrifty orchard. The building faces the south, and is 14x36 feet long. It is supported by posts 8½ feet high. The east side has 8x12 and the south 7x22 feet of glass, and next to the ridge on the south side of the roof, a covering of glass, 4½ feet wide and 36 feet long, stretches along the whole length of the building. There are two doors—one at each extremity of the south side, close to the ends of the building. The house is intended for laying hens during the winter and for raising early chickens. He has several plans for dividing the building, but wishes to get the benefit of suggestions through the RURAL.

ANS.—A method of dividing the house is shown herewith. A central department may be set apart for nests, which may open both



into the large rooms and the central one. The roosts would be at the back of the house, and may be arranged as described in the article on poultry conveniences in a late issue.

Douglas Mixture for Poultry.

D. M. L., Great Valley, N. Y., having seen that the RURAL recommends the use of Douglas Mixture for poultry, asks whether there is danger in using too much of it; what quantity should be given; how often; how is it made, and what are its effects.

ANS.—There is danger of uneasiness, at least, in eating too much of anything, however healthful enough of it might be; about a tablespoonful of the "mixture" in a quart of drinking water, is about the right proportion; it is composed of sulphate of iron, sulphuric acid and water in the proportion of half a pound of the first, half an ounce of the second and two gallons of the third. Besides being a preventive of roup, a strengthener during molting time and beneficial in several other ailments to which fowl flesh is heir, its use two or three times a week, or oftener, gives a bright red color in the ears and comb, adds much to the appearance of the birds in the show pen, and it is generally a healthy, invigorating tonic.

Fowls Eating Feathers.

C. W., Evanston, Ill., feeds a mush made of bran and meal to his poultry together with pork scraps in the feed, yet the hens keep picking the feathers off his rooster's neck, and he asks why they do so, and how to prevent the practice.

ANS.—Confinement and want of occupation are among the chief causes why fowls eat feathers. The former is often inevitable in winter, but the latter can be avoided by burying some of their grain food in sand and allowing them to hunt for it, which will afford them pastime and healthy occupation. Give them some green food, fresh meat two or three times a week, burnt bones, oyster shells, charcoal, clean water and a clean hennery, and if all this doesn't cure them of the habit, follow Lewis's advice and wring their necks, for they are incurable.

Shipping Eggs to a Distance for Hatching

R. McD. S., Oak Grove, Texas, asks whether he could have Light Brahma eggs shipped to that place, and if so, whether they would hatch, and if so, where could he get them.

ANS.—Eggs are shipped every year greater distances than this, and yield satisfactory results. Eggs sent from the New England States to the Pacific coast usually hatch well; much, however, depends upon the packing. If carefully packed and handled, the journey should not hurt them at all. Any of the advertisers in this paper who breed that variety will supply eggs to order.

Pigment from Clover Seed.

In a late issue of the RURAL a question was asked about the process of extracting coloring matter from clover seed, and we replied that after a good deal of research and inquiry, we could obtain no information on the subject. A correspondent has just written to us that large quantities of clover seed—principally such foul seed as would not answer for seeding purposes—are shipped to France and Germany for coloring prints, etc., and he referred us to a firm in this city who could give full information on the subject. Inquiry from the firm mentioned, however, has failed to obtain any information.

Prices of Jersey Heifer and Bull Calves.

Several subscribers ask the prices of Jersey heifer and bull calves.

ANS.—Jersey heifer calves range from $50 to $100; yearlings, $75 to $150; two-year-olds, coming in, $150 to $250. Exceptionally fine animals bring fancier prices—bull calves and yearling bulls, $40 to $100; good ones attainable at, say, $50 to $75. Exceptionally good ones, from best butter stock, full black points, light-colored hide and very yellow skin, are in demand at fair prices, say, $250 to $500. All the above refers to animals capable of registry in the American Jersey Cattle Club Register.

Black-Crested, White Polish Poultry.

D. P. E., South Norwalk, Ct., asks about the "Black-Crested, White Polish" spoken of on page 806, RURAL of Dec. 21st ult.

ANS.—The variety is extinct. No specimens have been seen for fifteen or twenty years. They were always rare, and we do not believe they were ever seen by any of the writers on poultry in the United States. Numerous efforts have been, and are being made, to reproduce the variety, but thus far without success.

Miscellaneous.

F. S. Sleeper, Galesburgh, Kalamazoo Co., Mich., asks where can he get seed of Lost Nation Wheat. He wants the address of our correspondent C. G. H. Watkins, Ohio, who wrote about it, so as to be able to correspond with him on the subject.

ANS.—We give our friend's name so that C. G. H. may correspond with him. We have received a number of good accounts of this wheat. Dr. Hoskins, of Vermont, may give the needed information. A letter addressed to him at this office will be forwarded. We do not feel at liberty to make public the addresses of our contributors.

G. P., N. Y. City, asks the present residence of an actor he mentions. 2. Whether any entomological periodical is at present published in the United States?

ANS.—We do not keep the "run" of actors. An inquiry addressed to the Clipper would probably elicit the address wanted.

2. The Canadian Entomologist, London, Canada, is the only strictly entomological journal we know of. The American Naturalist gives large space to the subject and is published in Philadelphia.

J. A. M., Margaretville, Delaware Co., N. Y., asks where can he get the seed of the Jujube tree.

ANS.—This tree is not hardy, we believe, north of Georgia. Its botanical name is Zizyphus; it belongs to the Rhamnaceæ, or Buckthorn, family and is a native of Asia. Seeds can be procured of Thorburn & Co. of this city and of prominent Southern houses—perhaps of P. J. Berckmans of Augusta, Ga.

O. A. S., Mason City, Mo., pleased with the representation of berries on our "Index" sheet, asks where he can get roots and at what price.

ANS.—Of any of the nurserymen advertising in our columns. The prices so vary according to kinds that we could not make out a list, but they can be learnt from the catalogues which most of the firms furnish *gratis* to intending purchasers.

W. M. M., Ashley, Ill., asks whether the "Learner's Instrument" advertised in RURAL of Dec. 21 is a humbug and whether its advertiser is reliable.

ANS.—We have hitherto heard no complaints of the instrument, and before the advertisement was admitted into our columns we made satisfactory inquiries in regard to the standing of the advertiser.

"An Occasional Reader," Blackstone, Mass., asks why the RURAL is sold at retail in his town for six cents when the price should be a cent less.

ANS.—Probably because the newsdealer fixes the price at that figure. It is retailed at the "news" stands here for five cents. He can easily remedy the matter by subscribing for the paper and becoming a "Constant Reader."

B. G., Askowa, Ont., asks 1, what is the latest and best work on green-house work; 2, is there any good reliable periodical devoted to green-house work.

ANS.—A late work by Peter Henderson of this city. He can furnish it. 2, Not that we know of.

J. H. R., Utica, N. Y., asks whether the factory opened in Maine, some time back, for making sugar from sugar beets, has turned out a success.

ANS.—It will require another year at least before the experiment here mentioned, can be called a success.

L. S. Plattenburgh, N. J., asks where he can get "Carbolic Salve" and "Douglass Mixture" for poultry.

ANS.—Both can be got from Geo. S. Josselyn, Fredonia, N. Y. The "Mixture" can be "put up" by the next druggist; the recipe for compounding it is given elsewhere in this department.

S. McN., Jamestown, Pa., asks for information about budding and grafting fruit trees.

ANS.—A copiously illustrated article treating of this subject exhaustively, appeared in our issue of March 16, '78, page 166, and we refer our friend to it.

Mrs. W. P. J., Baldwin, Butler Co., Pa., asks whether the dealers in Mendelssohn pianos, who advertised lately in the RURAL, are reliable.

ANS.—The Company is reliable, but we have received complaints that the piano disappoints customers.

S. C. So. Vernon, Vt. asks whether the Hulless Oats are of any value as a crop.

ANS.—Of no special value. See Brevities last week.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JANUARY 25th.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, FEB. 1, 1879.

We will be pleased to send one or more copies of the RURAL NEW-YORKER *free to any of our subscribers sufficiently interested in its welfare to be willing to hand them to their neighbors for inspection. An intimation by postal card will suffice.*

OUR readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to* THE RURAL PUBLISHING CO., *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

Applicants for seeds will please observe that the postage on ANY POSSIBLE *selection of* TEN *sorts of seeds,* IS NEVER *more than* FIVE *cents.*

A ONE-CENT *stamp suffices for any selection of ten varieties* EXCLUSIVE *of the Beauty of Hebron potato, Pearl Millet and Defiance wheat. If the first of these three is included in the list, then a two cent* EXTRA *stamp is needed, and if the second and third are included, an extra two cent stamp is also required.*

WE offered, some time ago, to sell the cuts used in this Journal for twelve cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

CO-OPERATION IN THE PURCHASE OF FARM IMPLEMENTS.

IN an article lately upon "Skilled Labor," we showed that the inevitable tendency of the present unorganized condition of agriculturists is to break up our democratic system of small, independent farming, and to aggregate these small farms into large ones, on which machinery may be employed as largely as possible.

In our country where education is open to all, and where intelligence is more generally diffused than in any other land, it would seem that these small holdings might be more generally saved to their owners by a simple plan of co-operation. Superior intelligence ought to result in a superior social system among our farmers—ought to add to mutual confidence and reciprocal help. The concentration of the landed property of a country in the hands of a small minority of its inhabitants is quite congenial to a monarchy, but it would be decidedly opposed to the progress of republican institutions in this country. The breaking up of small proprietors would interfere with our school system; for, owing to the sparse population of large districts, there could be only a small attendance at some of the schools unless the scholars traveled from greater distances than would be desirable. Its political bearing also, would be disastrous to the well-being of the State, as it would constantly create more and more disproportion between the populations of country and city, until all political power would gravitate to the latter, and who can look with indifference upon the time when a great State shall succumb to the easy virtue of its cities? We feel like doing all we can to increase and not diminish the number of these independent tillers of small farms.

And if these small farmers will study co-operation, it will put them in possession of all the facilities for working their land with the best labor-saving machinery. And as can easily be shown, this co-operation will give each of them all these advantages as cheaply, in proportion, as if he owned all the farms of his associates. Let us suppose that one set of machinery will work 300 acres of land, and that these 300 acres are owned by seven farmers—five with 50 acres each, and two with 25 acres—all adjoining. Now what should reasonably hinder these seven farmers from forming a co-operative partnership in the purchase and working of all the machinery required to till these 300 acres to the best possible advantage? As there are in this supposed partnership two, each of whom owns 25 acres, this number of acres must represent a share, and each of the fifty-acre farms will hold two shares.

Let us suppose them to purchase a mower and reaper, and if in a grain region, a self-binder, hay-tedder, grain drill, field roller, two-horse cultivator, an artificial-manure distributor, stock and hay scales, horse-power, straw-cutter, etc. These and perhaps a few other implements would cost from $800 to $1,000, and each share would cost from $66 to $84. The seven farmers would even feel the cost less than a single farmer owning the 300 acres; for the seven small farms would be worth more than the one large farm, and there would be more work for the set of machinery, as the small farms would be worked more carefully and the aggregate production would be larger, and the more the machinery was used, the more profit.

If it is objected that eight farmers could not be accommodated with one set of implements, it may be answered that a proper division of time would afford abundant opportunity for all the work to be done on each farm, since the area of land is no greater than is often worked in one farm with one set of machinery. In haying and harvesting, each could use the mowing and reaping machines in rotation. The horse-power straw-cutter would enable each one to cut his hay and straw or feed in the most economical way. Moreover, owning the machinery together they would be likely to assist each other, and thereby save the cost of considerable labor.

In a social point, these co-operative partnerships would improve the neighborly relations among farmers in a marked degree. We urge this as a feasible means of preventing the necessity for the small farmer's selling out to his neighbor, and either going into new States, or accepting wages from the larger land-owners. This simple co-operation, requiring only a knowledge of business principles, will enable the small farmer to compete most successfully with the large one, and to maintain his footing under the most trying circumstances. The natural result of such co-operation among the small farmers would soon lead to the co-operation of larger bodies of farmers for other great and important purposes. It is want of social education that has prevented closer relations of farmers with each other, and their persistent, independent and individual action has made them the easy prey of the trading classes. We trust the future will show their capacity to act together, so that they may avail themselves of their natural advantages.

TO WHAT PURPOSE?

"MADAME ANDERSON completed, yesterday, the extraordinary feat of walking 2,700 quarter miles in 2,700 consecutive quarter hours at Mozart Garden, Brooklyn."

The above or similar paragraphs appeared in most of the New York and Brooklyn papers for January 14.

That any one, and more especially any woman, could be possessed of persistency and endurance sufficient to enable her to accomplish such a feat as this, is wonderful. Had it been only to walk six hundred and seventy-five miles in four weeks, choosing her own time for walking and resting, it would have been considered an accomplishment worthy of remark, a task few women would care to undertake.

Such are the thoughts that seem to occur first when reading such an announcement, but to all reasoning minds comes the question: "To what purpose has it been done?" And the only reply that can be made is: "For the purpose of transferring money from the pockets of the curious and the idle to her own." If the question be varied, and it be asked what good purpose has it subserved, the only answer is: "None—not the least." No one is better, morally or physically, for it—we wish we could know none is worse. It is reported that the Madame's share in the profits was $8,000. When we consider what she has undoubtedly lost, this sum seems small in comparison. She has gained in money and notoriety, and lost in many ways—especially in vigor and doubtless in length of life. She has sinned against herself, and through herself, against her Creator. Whatever power of mind or muscle one is gifted with should be used for the good of, first, its possessor, and, next, of those about him, and of mankind as a whole. The parable of the talents should not in its application be confined only to money or intellectual possessions. One is as truly accountable for the way in which he expends his strength, as for the way in which he disposes of any other of his possessions. He is not the fit possessor of wealth who will not use it for good ends. Nor is the athlete to be pardoned who wastes his powers in foolish exhibitions from which no good results. Madame Anderson's argument is that she can make more money in a month this way than by any other labor or profession in years, to which our reply is: "Making money is not the chief end of life."

We know not what others may think of a husband who can see his wife endure and suffer with equanimity, not to say pleasure, what Madame Anderson has undergone during the past month. He must know that she is violating physiological laws for which she must pay the penalty, probably by a ruined constitution and shortened life. But he has been content to see her, day after day, walk her rounds, with feet blistered and lacerated, and sometimes in such a state of stupor that it required the assistance of her "coach" to keep her upright and on the track, while often she had to receive from him a sharp blow on the shoulders to rouse her to consciousness and keep her up to her work. We do not know the man, and have no desire to make his acquaintance, but we must believe him devoid of common humanity, and shall not be surprised to learn in after times that he has spent in gambling and debauchery the money she receives for these exhibitions, leaving her at last to starve in a garret or to die in a hospital.

If a child or an animal had been compelled to endure such pain and fatigue during the last month, the strong arm of the law would have been invoked in its behalf. But a woman is supposed to have free will and to act from her own desires. We understand, however, that, without disputing the above ground, some women of Brooklyn have petitioned the Common Council to prevent such exhibitions in future on the ground that they are in violation of laws for the observance of the Sabbath, and tend to induce intemperance and immoralities. Had this been merely a local matter we should not have mentioned it in our columns, but we understand the exhibition is to be repeated in all of our principal cities (if the woman lives long enough) and we have no doubt she will have scores of imitators. We desire therefore to enter our protest against all such in the name of common morality and of right. There are none who commend the proper exercise of the physical powers more strongly than we do, or advise the too much neglected practice of walking. One in good health should be able to walk several miles at fair speed, say, four miles an hour, without undue fatigue. We have more than once urged this upon our readers, and shall doubtless have more to say about it in future.

FREE SEED DISTRIBUTION, ETC.

WE may now state that we shall begin our Free Seed Distribution on the 15th inst. As soon as it is ended, we propose to send to all who apply a few ounces of a new variety of field corn which we believe to be one of the most prolific varieties ever cultivated. Of this specific notice will be given in due time. We ask of our friends that they will carefully plant and care for the seeds which we offer them, and that as they are enabled so to do, they will report to us just what they think of them.

It is very evident that we can have no object in sending out seeds that are not superior of their kinds. It would be short-sighted, indeed, for us to praise these seeds beyond their deserts, sending them, as we do, among those who can in a few months verify the accuracy of our statements. We have said that many of the seeds offered in our list cannot elsewhere be procured. Fearing that we should fall short of several kinds, we have ourselves sent to the leading seedsmen of England and France for additional supplies. But we have failed in this way to procure an ounce.

It is becoming more and more evident to us that agricultural and horticultural journals are the mediums by and through which new seeds and plants should be distributed and tested. It is the editors' duty to keep posted upon all new plants and methods. How can they do this without experiment grounds? They should instruct the seedsman rather than receive their instructions through his catalogue which is generally a mere re-statement of what is said by the seedsmen of other countries. If many of our agricultural papers are as prosperous as their statements would imply, and if they have the welfare of the farmer, fruit-grower and gardener as closely at heart as they profess to have it, they will follow the RURAL's example, viz.: secure experiment grounds, test seeds, plants and fruits for themselves, distribute novelties among their subscribers, and by such means benefit their readers as they never can do by merely sitting in their sanctums and copying, re-hashing, or criticising the statements of others. Many of our seedsmen raise their own seeds, but it is submitted that the introducer is not an impartial judge of his own plants.

BREVITIES.

COL. CURTIS knows of a remedy for the hard times.

SEVERAL of our correspondents speak highly of Lost Nation (Spring) Wheat.

WE do not know that we shall ever again find space for our weekly table of contents.

THE Indiana Farmer, from its own experience, corroborates what we have said of the Acme Tomato.

WE have just eaten some sugar made from the stalks of Pearl Millet by the Agricultural Department at Washington.

PROF. ARNOLD succeeds ex-Governor Seymour as President of the New York Dairymen's Association. If a successor had to be found, it is fortunate that the choice fell upon so excellent a one.

ISN'T it a trifle curious that the President and Vice-President of the Great International Dairy Association of the future should both have been elected to those positions on account of their interest in the sale, not of genuine dairy products, but of salt.

THE farmers of Massachusetts have good reason to regret that their State Agricultural College has lost the services of its efficient president, Col. W. S. Clark. A man of wide experience, fine abilities, and a hard-worker, he was eminently fitted to advance the best interests of the institution over which he presided.

AMONG the most remarkable new plants of last year, Conophallus Titanum may be considered the most remarkable. It is an Arold like our Calla Lily. "Its tubers measure five feet in circumference and its leaf 45 feet in circumscription, on a stalk 10 feet high, while its spathe, of a bright black-purple, measures nearly three feet across."

AT the dinner of the N. Y. Hort. Society, given last Wednesday evening at the Astor House, everything passed off in an agreeable way. Wilson G. Hunt presided, and among the guests—about seventy-five in number—were Mr. Dana of the N. Y. Sun, Thomas Hogg, S. B. Parsons, and many of the seedsmen and florists of the city and suburbs.

THE announcement in our "news" columns of the death, by consumption, of Joseph N. Sturtevant, one of the well known Sturtevant brothers of Wanshakum Farm, will carry regret to many a farm fireside; for the deceased gentleman was not only a frequent contributor to the Scientific Farmer, but also a thoughtful writer to the agricultural press in different parts of the country.

WE find there are many people about the country who are willing to utter falsehoods for the sake of sharing in our seed distribution. They praise the RURAL as the best paper ever published, Send stamps and make their choice of ten. But their names are not upon our lists The greater number of these people will find that they have told "stories" and parted with their stamps to a poor purpose.

DEFALCATIONS and defaulters are now the fashionable words which we use to designate thefts and thieves in high places. Those are the words to polish over the crime—these to designate the criminals. Physicians find it profitable to give new names to old diseases. They are talked of, feared and written about more. Old plants are "introduced" under new and winning names, thus securing a ready sale. There is ever so much in a name.

DURING several months past we have been experimenting to ascertain what degree of looseness or compactness of soil best promoted the germination and early growth of seeds. In one of these experiments the "lifting" power of the growing embryo was well shown. Radish seeds were planted half an inch deep in a number of pots. In some of them the soil had been pressed so compactly that the little plants were unable to penetrate it, yet they grew, nevertheless, raising the entire layers of soil above them, fully half an inch thick, and supporting it for a day until it cracked and broke into pieces.

THERE is one part of the RURAL which many of our farming friends do not study as closely as they might with profit, to judge from the questions frequently sent us with regard to matters full information on which could be found in our market reports. In these days of small margins on agricultural products a close study of the local and general markets is essential to secure all the advantages derivable from judiciously selling and buying. Nowadays only a moiety of the goods used on a farm are produced on it, and it is therefore desirable that the farmer should become a close buyer as well as a shrewd seller. It is to place within his reach the best means of accomplishing this twofold object that we are careful every week to collect the best and latest market reports at this point, where, in reality, the prices are fixed for the rest of the country.

THE editor of the Agricultural Department of the New York Tribune is extremely careful to give credit for every item taken from other journals—even if but a line in length—and he naturally insists that others should do so as well. The following note is taken from the Tribune of Jan. 22:

"We are informed that an article about The Sheep's Foot, lately quoted in the Tribune, with credit to the Cincinnati Times, appeared originally in the Rural New-Yorker. And has it come to this, that we can't curry one of these Western papers without—finding a Tartar?"

How can agricultural editors set themselves up as entitled to the confidence of their readers if their columns show that they are capable of such thefts? We scarcely ever look over our exchanges without finding articles in them published as original, which were written for our columns.

Literary Miscellany.

WEAKER THAN A WOMAN.

CHAPTER XXVII.

(Continued from page 62.)

"I WILL, Felix; I will do my best," he replied.

Eve Lester came and talked to him; Katie cheered him; and between them the sorrow-stricken man took courage, and resolved to go amongst his friends again. Friends or foes, no matter which, he would go amongst them.

Kate will never forget how she helped him to dress, how she quieted the trembling nerves, while Eve cheered him with brave words.

"I shall remain here until you return," she said, "for I am quite certain you will bring good news with you, though I cannot think what the good news will be."

"I am quite at a loss to imagine why both Eve and you, Felix, should think good fortune lies in store for me," observed Darcy Lonsdale. "I have been under a shadow too long."

But Felix would not listen to one desponding word.

They had engaged a fly to carry them to the "Bramber Arms," and both father and son were surprised at the decorations, the flags, the evergreens, the arches of welcome.

"People show great respect to Lord Arlington," said Darcy Lonsdale—"and well they may, for he is a just man."

Then, together, father and son entered the assembly-room, where the grand banquet was laid. They saw the Earl at the top of the room, surrounded by a group of gentlemen.

"I shall go straight to him, Felix," said the lawyer; "there shall be no mistake about it. I will not sit at his table under false pretences."

"You shall do as you will, father; where you lead I will follow," was Felix's reply.

Darcy Lonsdale walked up to the Earl, but, before he had time to speak to him, Lord Arlington held out his hand and shook his with a hearty grasp.

"I am delighted to see you, Mr. Lonsdale," he said warmly.

But Darcy Lonsdale, looking into the Earl's face, said—

"My lord, before I take advantage of your kindness, let me ask you if you have heard that I have been charged with influencing one of my clients to leave me money?"

"Yes, I have heard it," replied the Earl.

"Have you heard that a jury of my own countrymen found me guilty, and that my fellow-townsmen—the old friends and neighbors whom I have spent all my life amongst—in their own minds found me guilty too, and have shown their opinion, most of them, by withdrawing their business from me—the old friends I loved and served, my lord?"

The Earl took his hand again.

"I have heard it, Mr. Lonsdale, and regret it. I am glad to have this chance of saying publicly that I disbelieve all that has been said about your guilt, and am proud to take the hand of an honest injured man."

"I thank you, my lord," returned Darcy Lonsdale.

His wonder increased when the Earl, turning to him, said—

"Your place, Mr. Lonsdale, is at my right hand."

The lawyer looked at him in amazement. Lord Arlington smiled.

"Yes, at my right hand," he said; "and after dinner you will know the reason why."

Wondering at this, Darcy Lonsdale took his seat.

"Your son will sit next to you," said Lord Arlington; "I shall want him as well."

Mr. Lonsdale saw the looks of wonder from all the gentlemen assembled.

"They are not accustomed to see me so honored," he said to himself bitterly.

Then the grand banquet began, and it was one long remembered in Lilford, because of its grandeur and costliness; those who partook of it described it in few words—it was worthy of the Earl who gave it. It came to a close at last, and the Earl ordered some more wine.

"I shall have a toast to propose presently, gentlemen," he said, "for which I shall want brimming glasses. Before giving it, however, I have a few words to say to you."

Silence deep and impressive fell over them; when the Earl spoke in the tone that he did, he meant something. There was not the faintest sound when he began.

"Gentlemen, old friends and neighbors I may say, there has been an injustice done amongst you which I have asked you here to-day to set straight. Understand me plainly, as an Englishman I uphold the legal institutions of my country. I bow my head to the decision of a judge; I listen with respect to the verdict of a jury. But, gentlemen, human laws, just because they are human and not divine, must at times err; and I say they erred when they pronounced a man as honest, industrious and honorable as my friend Darcy Lonsdale capable of influencing a woman to leave him her money. Gentleman, the judge who gave sentence against him was a stranger to him, and the jury who decided in favor of the heir-at-law did not know him. But you know him; he has lived amongst you all his life, he has served you to the best of his knowledge, and not one amongst you, man, woman or child, can say that he has ever spoken a false word or done a mean deed. He has always been industrious, honest and generous—a loyal subject, a spirited townsman, a true friend, a devoted husband, a kind father. He has spent his life amongst you, and not one of you can say that you have ever known him to do wrong. If you can, speak."

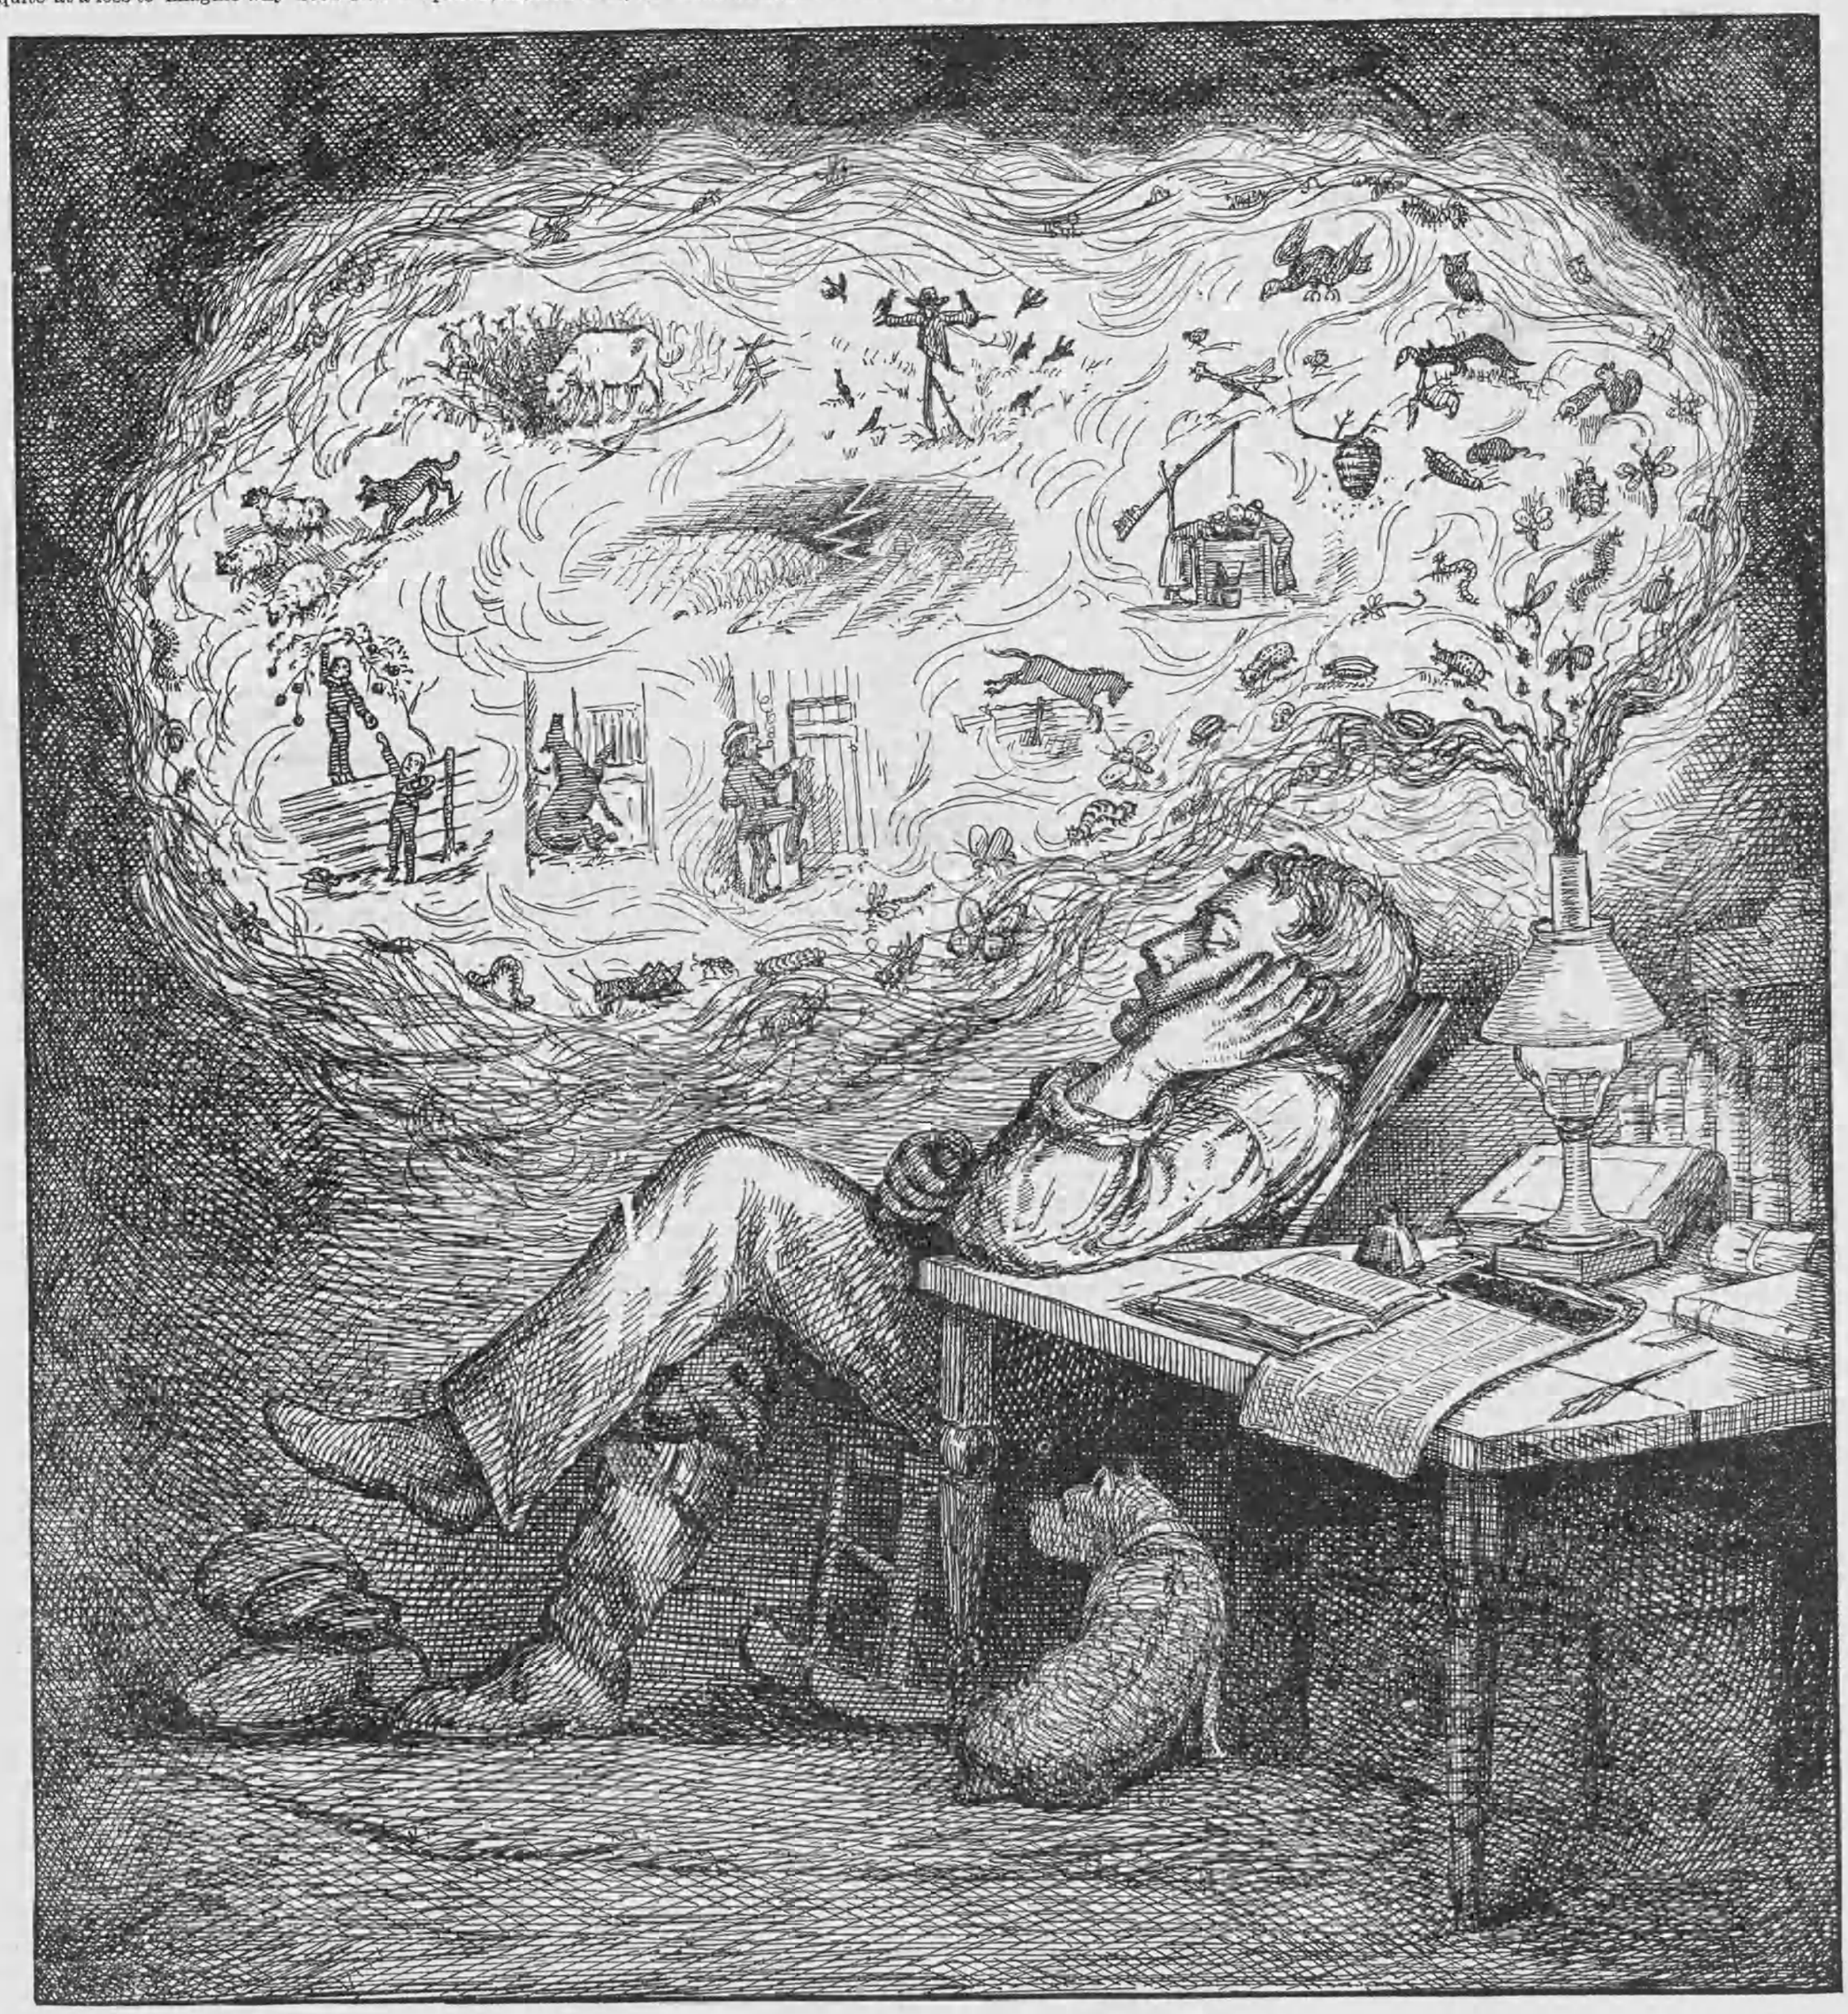
There was a dead silence which lasted for some moments, and then a voice said—

"You are right, my lord. Not one amongst us has ever known him to do wrong."

"I am sure not," declared the Earl. "Now mind what I say. With the jury and the judge who thought James Hardman entitled to Elizabeth Hardman's money, and who really believed that Darcy Lonsdale had wrongfully used his great influence with her, I have nothing to do. They did their duty, honestly, even if mistakenly. To you who constituted yourself judge and jury—to you who, knowing the man and his character, judged him yourselves as guilty—to you I wish to speak. I believe him innocent. I have read carefully since my return every word of the trial; and I say before you all, in the most emphatic words that I can use, that I believe him to be innocent, and, what is more, to be a deeply injured man."

He was obliged to stop, for there rose from the lips of the men who had misjudged Darcy Lonsdale, who had shunned him, who had withdrawn their business from him, who had half broken his honest heart by their conduct, a cheer such as had never been heard in Lilford. Perhaps in their hearts they had never quite believed him guilty. Perhaps the Earl's noble words touched them with compunction and regret. Something appealed to them, and they cheered until the walls of the "Bramber Arms" shook again.

"We are agreed then, gentlemen," said the Earl. "Our old friend and fellow-townsman is an honest, honorable gentleman."



A MIDSUMMER'S DAY DREAM.

They cheered again and again. It was with some difficulty that the Earl could make himself heard. At last silence was restored, and then he continued——

"We can never make up to him for all that he has suffered; we cannot give him back the strength, the hope, the happiness he has lost; we cannot atone for the wretched hours, the sleepless nights and the weary days—all that is beyond us. But I have thought of a plan by which we may aid him, and I want the close attention of every gentleman present while I propose it."

The Earl paused for one moment, and those seated at his hospitable table looked earnestly at him; there was still deeper silence when he began to speak again,

"There is no secrecy in England. Everything done in the country is as open as the sea that surrounds it. Our newspapers ventilate everything, and in one sense that is quite right; but in a case like this it is hard. Throughout the length and breadth of England men have read how Darcy Lonsdale's case went against him, and how he lost the money left to him. I want something else to go through the length and breadth of the land; I want people to read how Darcy Lonsdale's friends and townsmen—myself at their head—met and expressed their sympathy with him, and that they presented him with a handsome testimonial to show their full confidence in him and to make up for his loss. That testimonial I propose to head myself with five hundred pounds; and I venture to say there will not be a nobleman or a gentleman in the county who will not add his name to the list."

Cheers again arose—never had the "Bramber Arms" heard such cheers. Darcy Lonsdale's face had grown deathly pale; but for the strong arm of his son thrown round him, he would have fallen.

"I have one word more to say, gentlemen," continued the Earl. "and it is this. My agent, Mr. John Sleaman, a gentleman whom you all know and respect, is leaving me. I am glad to say that a fortune has fallen to him, and that he is going to enjoy it. I propose now to ask Mr. Darcy Lonsdale to take his post. The emoluments are good—one thousand per annum and a house to live in. If he will accept the office, I shall be proud to place my interests, my welfare, my property, in the hands of a worthy, honest, and honorable gentleman. Yet one word more. Mr. Lonsdale is no longer young; but he has a son—I wish we all had such a son—and I propose that he acts, if necessary, in his father's place, always of course with his authority; if he does, I shall secure two good agents instead of one. Gentlemen, join me in drinking the health of a valued, trusted townsman, of an honest, honorable man, my agent Darcy Lonsdale."

It was drunk with such honors as a man's name seldom receives. Then Darcy Lonsdale rose and turned his white face to them; but he could make no speech—the only words his trembling lips could utter were—

"Heaven bless you, my lord! I cannot thank you, though you have made a man of me again. My dear old friends and neighbors, how could you have misjudged me! But you see now that it was all a mistake. I am glad of it. In future we will deal gently with each other, we will judge each other mercifully. Lord Arlington, you have saved my honor; henceforward command me as you will." Then, unable to say any more, he sat down.

Doctor Hunter was the first to leave his place and shake hands with him.

"I confess I never believed one word of the story, Mr. Lonsdale," he said, "although I confess that I have avoided you. Will you shake hands and let the past be past?"

After that the guests went up to the lawyer one by one and shook his hand. Some frankly avowed that they had misjudged him, some begged his pardon, some said that they had gone with the many; but every man present wished him well and God-speed in his new life.

The speech worth hearing when that scene had passed, when justice had been done to an injured man, when peace had been made, was when Doctor Hunter stood up to prospose Lord Arlington's health. Never was a toast so received; for there is nothing after all which touches an Englishman's heart sooner than defense of the weak, love of justice, and generosity.

It was a pleasant evening, and Lord Arlington had so contrived matters that Darcy Lonsdale was the hero and not himself. He was all that was most kind and considerate; he talked to him, and won his son's heart forever. But in everything he put Darcy first, so that people might understand all this had been done for him. Was it any wonder that when he was gone the men stood in little groups, each one praising him?

Felix followed him to the door of his carriage and said—

"My lord, your life is filled, so people say, with great and generous actions; but none could be so great, so generous, so noble, as that which you have done to-day."

"I have only done justice, my dear boy;" said the Earl, kindly. "Your father was an injured man; I have tried to set him straight, and beside, I wanted a good agent, and I found one."

"You cannot make light of the deed," returned Felix; "it is a good one. My father appears to be a new man to-night; there is a light on his face and fire in his eyes that I have not seen for long months. The miracle has been worked by you—you have removed the false reproach attaching to his name. I can fancy, but I cannot tell you, what our home will be like to-night. My heart beats fast when I think of the mother and children there, my lord. I am not very eloquent, and I am moved too much for words—I can only echo my father's request, command me as you will."

The Earl was more touched than he liked to show by the emotion on the handsome young face.

"I will make you this one promise, Mr. Felix Lonsdale," he said—"if ever I want a service done, or want a friend, I will come to you."

"Thank you, my lord," responded Felix; and when the Earl drove off home he knew that he had left some of the happiest hearts in England behind him.

What a night it was! The Vicar drove away soon after the Earl had left; and then one by one the company dwindled down to about twenty. These would not let Darcy Lonsdale leave them—they had so much to say to him, and were so anxious to make up to him for their coldness; and when the host grew anxious, they would not separate until they had sung "Auld Lang Syne" in chorus. Then they escorted father and son to Vale House, where Eve and Katie anxiously awaited them.

"I am quite sure," said Eve, springing from her seat, "that I hear them; and that is Mr. Lonsdale laughing—do you hear, Katie?—laughing—and he has never laughed since the trial! Now I know there is good news."

There was good news in very truth, and the pity was that Lord Arlington was not there to see Kate clasp her arms round her husband's neck and sob out that she always knew matters would come right—that he was so good Heaven was sure to make his innocence clear. Presently she looked at him with tremulous lips.

"Is it really true, Darcy, that you are to be the Earl's agent and have a thousand a year? I can hardly believe that it is all true."

"It is true, Kate," he replied. "Eve, my dear, what have you to say to me, my true friend—the one true friend who loved me well enough to offer me her fortune if I would take it? Eve, I shall never forget that."

It had been arranged that Eve should spend the night at Vale House, so they sat round the fire until they were quite ashamed of the hour, and Felix repeated every one of the Earl's noble words, while the two ladies listened in raptures; every time he paused they said, "Go on, Felix," until he assured them that he had repeated every word.

"So it will be printed in every paper in England?" said Kate. "Well, my only puzzle is, what could have inspired Lord Arlington to do such a kind and generous action?"

Felix knew that Lady Maude had been the chief instigator of it, but that was a secret he never told—he kept it all his life. It was Darcy Lonsdale who answered his wife's question.

"My dear Kate," he said, "Lord Arlington has a love of seeing justice done. I remember when he raised half the county because some wrong had been done to a toll-gate keeper. It was such men as he who made Old England what she is, and who made the word 'England,' a synonym for honor."

And then these simple people, who had been through the fiery furnace of suffering, who had borne sorrow, shame, and disgrace, who had never ventured to hope for justice in this world, knelt and thanked Heaven for their rescue; and Darcy Lonsdale's eyes grew dim with grateful tears as he opened his Bible and read how the just and merciful Creator saves those who put their trust in Him.

Gradually they awoke to the full reality of the good fortune that had befallen them. The strength of his youth seemed to have returned to Darcy Lonsdale; he took his place once more amongst his townsmen, he went briskly to and fro from his office, he worked hard at his business, the clerks came back one by one to the office, and far more than its ancient glory returned to the house of Lonsdale and Son.

Katie could not rest until she had seen the Earl, in order to thank him; and the little lady went over to Bramber Towers and asked for an interview. She tried to thank him in a dignified matronly fashion and ended by falling upon her knees and kissing his hand, very much to the Earl's confusion and delight. It was a new life for them all, and the warmth of it cheered and brightened them more than anything had ever done before.

The day came when Darcy Lonsdale put his arm lovingly on his son's shoulder and said—

"Do not think, Felix, that in the midst of my troubles and of my prosperity I have given no thought to you. I am doing the best I can for you by giving you so much work that you will have no time to regret your lost love."

"My dear father, I shall regret her until I die," returned Felix.

"The young always think both their love and their sorrow immortal. I will say now what I have never said before, because I thought it would pain you—I thought she was not worthy of such love as yours. She had nothing but a beautiful face to recommend her—her soul was not beautiful, her heart was not true. The time will come when you will say that you had a fortunate escape. I pray Heaven it may be so."

But Felix looked grave; the world must come to an end before he could see a silver lining to that cloud—the cloud of his misplaced, unhappy love.

(To be continued.)

WHAT HAPPENED TO SEVEN GIRLS IN TEN YEARS.

MARY WAGER-FISHER.

ROSWELL'S letter was addressed to Mary Walter, and her letter comes next in order:

PHILADELPHIA, Jan. 2, 1877.

DEAR BIDDLE:—Last night came to me, forwarded from New York, the inclosed autobiographical letter from Roswell, which explains itself. I suggest that after reading it, you send it on to the "Cookies;" that they in turn forward it to Raynor (now Mrs. Z. R. Carlton, Cairns' Point, N. Y.), and she will send it to Lee, who will have the kindness to send it, with its accession of letters, back to me, when I will send the batch to Roswell.

My! hasn't Mary Roswell had a career! I wrote her quite a long letter last night, giving her the whereabouts and whatabouts of "us girls." She outstripped us all in falling in love and getting married. I am heartily glad she is anchored at last, and so very happy, and trust that her Swede will continue to prove to be all she believes him to be.

As for my own experiences, it would take me ten years to relate them in detail. I can only give the skeleton of my whereabouts, which you girls may clothe with the flesh of fashion and folly, of high life and gay life, of serious thought, of earnest work, or with whatever else may suggest itself. You cannot hit far from the mark, for my experiences have been wide and deep, although not at all like Roswell's. So here am I categorically for the past ten years! As Lee Jaynes would say "Walter opens her mouth."

Last of June, 1867, left Richmond for my home in Western New York. April, 1868, being thrown upon my own resources, I began a literary career in New York city. Spent a month, in the summer of that year, with Biddle at the "Cookies'." In the summer of the following year, made a tour through the West. Spent the spring of '70 in Washington, and the following summer in Newport and at Long Branch. Winter of '70 and '71 in New York; the summer at Saratoga, with a fortnight at Cairns' Point with Zethrea. Winter of '71 and '72 in New York and Washington; the summer at Sea Grove and the Lakes of New York. July 27, 1872, sailed for Europe. Winter, spring and summer of '72 and '73 in France, Italy, Austria and Hungary.

In May, 1873, in the Pantheon at Rome, in the moonlight, made the acquaintance, with a party of friends, of "my future," as the French say—a young man of goodly presence, whose card bore the simple Saxon—William Raleigh Darrell. (When Mercy Biddle first saw him she said "William the Conqueror.") It was a case of love at first sight, at second sight, and at all sights, for, after being over head and ears in what Lee would call the "Heaven-born-marriage-love," I made up my mind, that if I was ever married, it would be to that man. And he, poor soul, seemed to be laboring under a similar delusion. The delusion continued during the fall and winter of '73 and '74, spent in Paris. In the summer of '74, after a month in England, I sailed for New York, where I remained for the most part until the following summer-time, when I was "on the wing"—at Round Lake, Saratoga, Philadelphia and Niagara Falls. In the first month of the Centennial year, I was married to the "man of my heart,"—whose profession is Law, and whose law is love,—and who, as a man and a husband, physically, mentally and morally, "is all that could be desired," which you may imagine written in capital letters as high as the moon. We were married with very little ceremony, after the manner of the Quakers, in a room full of friends, neither of us promising to "obey," but each and both subscribing to the same vows. When I said good-by to New York, some one threw a pair of old slippers after us for luck, and we were whizzed away to this city of Brotherly Love, which is our home. We are both happy as well-nested pigeons and busy as bees. *His* troubles have been only mental conflicts and his paths those of prosperity and peace. *Mine* have been somewhat sterner, but upon the whole these ten years have been full of adventure and wholesome discipline, of hard work and travel, of fair literary success and a comfortable financial income. I feel that my girlhood was well "filled in," and trust that my middle life and old age (for I intend to have one—Europe gave me a new lease of life) will partake of similar experiences and perhaps usefulness. I still scribble and study as of yore. Haven't changed much, I think. No gray hairs nor any of their relations! I "behave" better than in the Richmond days—am an excellent wife, which surprises me, for I had an idea, ten years ago, that there was not a man on earth I could live with, without at least one "pitched battle" a week. Ah, how little we know ourselves! Our chateau is slowly taking shape, and when once under our own vine and fig tree, come and test my excellence as a housekeeper.

In conclusion, have the kindness to accept the expression of my highest and most affectionate remembrance, in which my husband also desires to unite. Fraternally, MARY WALTER DARRELL.

NEW YORK CITY, Jan. 20, 1877.

DEAR GIRLS:—The other two letters will speak for themselves. I was not of the New Year's *party*, ten years ago (still I belonged to that clique of girls), for I was North begging, to save the Normal School. Sunday, Jan. 6th, 1867, found me again in Richmond. Just got my school started, and was telegraphed home again—to my mother's deathbed.

During the next two years, I was housekeeper for my father, the only break during that time, a visit to the Cookies with Walter, in the summer of '68. Spring of '69 my father married again, and in March I bethought me to study medicine, and commenced reading. Came to New York in Oct., '69, and spent the next year in the "New York Infirmary for Women and Children," studying and attending college lectures. The following two years spent all my time in college and studying, and in March, '72, graduated, receiving a diploma of Doctor of Medicine. I put out a little shingle, "Dr. M. Biddle," and laid wait for any sick unfortunates who might fall into my hands. I immediately got the opportunity to prescribe (in the Church of "The Holy Trinity") for the poor women of the parish, which I still continue to do. The year following my graduation I commenced teaching in college as an assistant, and am now lecturing on Materia Medica; also am Secretary of the College.

My success as a physician has been, I believe, all that I deserved. I love my work more and more, and am perfectly satisfied to live and die in my chosen profession. I have kept up the acquaintance of the "Cookies" and Walter (and was the only one of the six at the latter's wedding); also, of Mary Roswell, whose beautiful boy is enough to make any mother proud, I am sure. Poor wave-tossed girl! I am glad she is harbored at last.

"Plons-faced" Martha Cooke and I are the only ones out of the matrimonial noose, and so we celebrated our single-heartedness by doing the Centennial together. And perhaps I should say, that annually, we have a visitation at one or the other's place of business, and woe to any who shall dare to interfere with this time-honored usage till death do us part. I live in Fannie Fern's old home, where much of her spicy scribbling was done, and though I sit in her chair and move over her carpets, I cut with the knife rather than the pen. Come one, come all, to see me; come, if you are well, and come, be sure, if you are ill.

Sincerely, MERCY BIDDLE.

(To be continued.)

REAL CARE AND SHAM.

THAT sturdy son of the English church, the Bishop of Manchester, recently, in the course of a public speech, made some sharp remarks on the frivolity of social life, and read the following letter from a young woman to illustrate:—

We breakfast about 10. Breakfast occupies the best part of an hour, during which we read our letters, and my mother expects me to write her notes of invitation, or to reply to such. Then I have to go into the conservatory and feed the canaries and parrots, and cut off the dead leaves and faded flowers from the plants. Then it is time to dress for lunch, and at 2 o'clock we lunch. At 3 my mother likes me to go with her when she makes her calls, and we then come home to a 5 o'clock tea, when some friends drop in. After that we get ready to take our drive in the park, and then we go home to dinner, and after dinner we go to the theater or the opera, and when we get home I am so dreadfully tired that I don't know what to do.

This is an exaggerated picture, of course, or at least, however true of English society girls, could hardly be asserted of any considerable portion of this community. Yet the cares or what are magnified into cares of some people can hardly be of greater importance than feeding the canaries and parrots and cutting off dead leaves and faded flowers. There is a fatal facility in multiplying cares about nothing, until we seem to be absorbed and completely taken up with vanities and nothings. The more complex civilization gets, the more burdensome it becomes, until we are fain to run away in any direction from the tread-mill which we have built for ourselves. Take for instance the single item of the supply of food to our human necessities. Plenty is the first essential; then we must have variety and delicacy, then fine ware from which to eat and an experienced servant to care for it as well as to prepare the meals; other refinements are gradually added, until the performance of satisfying hunger amid plenty, becomes a feat of organization, cooperation, and execution, not at all inferior in difficulty to the original problem of procuring the raw material of food itself. It finally comes to this that there is more distress over the failure of the domestic to scrub the silver or brush up the crumbs, than there would once have been over the absence of the dinner entirely. Perhaps it is still truer of apparel that the demands of fashion impose on this generation more labor and vexation than the weaving and home manufacture of garments did upon the celebrated grandmothers.

This tendency of civilization to complicate rather than simplify our lives should be resisted at every turn. Let us be sure that these modern "conveniences" are not traps to impose some new and embarrassing fetters, quite different from the opportunity for enlarging life which is anticipated from them. Keep the necessities of life well within bounds and find something outside of them, of a more ennobling character, for all the leisure which can be made. It is very easy to fill up leisure with "fancy work" and "loafing" and imagine oneself tired from mere absence of exhilarating mental effort or personal experience outside of the most ordinary selfish ways of life.

It is sometimes a good moral discipline to think over one's burdens, separate the real and the necessary, from the fictitious and the needlessly assumed. The value of the practice goes beyond personal life into public affairs. The difficulties of public problems arise more from manufactured obstacles to improvement and reform than from real ones, however real the former may sometimes be made to appear.—Springfield Republican.

RANDOM BITS.

TRUE SOCIETY.—The society begins in the home. When two young people love each other, and marry, they restore the picture of the apostolic church. They are of one heart and one soul; neither do they say that anything they possess is their own, but they have all things in common. Their mutual trust in each other, their entire confidence in each other, draws out all that is best in both. Love is the angel who rolls away the stone from the grave in which we bury our better nature, and it comes forth. Love makes all things new; makes a new heaven and a new earth; makes all cares light, and pain easy. It is the one enchantment of human life which realizes Fortunio's purse and Aladdin's palace, and turns the "Arabian Nights" into mere prose in comparison. Think how this old story of love is repeated forever in all novels and romances and poems, and how we never tire of reading about it; and how, if there is to be a wedding in a church, all mankind go, just to have one look at two persons who are supposed, at least, to be in love, and so supremely happy. But this, also, is not perfect society. It is too narrow, too exclusive. It shows the power of devotion, trust, self-surrender, that there is in the human heart; and it is also a prophecy of something larger, that is to come.

But it is at least a home, and before real society can come, true homes must come. As in a sheltered nook in the midst of the great sea of ice which rolls down from the summit of Mont Blanc is found a little green spot full of tender flowers, so in the shelter of home, in the warm atmosphere of household love, spring up the pure affections of parent and child; father, mother, son, daughter; of brothers and sisters. Whatever makes this insecure, and divorce frequent, makes of marriage not a union for life, but an experiment which may be tried as often as we choose, and abandoned when we like. And this cuts up by the roots all the dear affections of home; leaves children orphaned, destroys fatherly and motherly love, and is a virtual dissolution of society.

know the great difficulties of this question, and how much wisdom is required to solve them. But whatever *weakens the permanence of marriage tends to dissolve society;* for permanent homes are to the social state what the little cells are to the body. They are the commencement of organic life, the centres from which all organization proceeds.—*Rev. Jas. F. Clark.*

JEWISH POPULATION OF THE WORLD.—According to the latest statistics that have been gathered, there are, in round numbers, 8,000,000 of Jews in the world, who are thus divided: United States, 73,265; Great Britain and Ireland, 42,000; Italy, 25,000; France, 49,439; German Empire, 512,158; Netherlands (Holland), 68,003; Austria, 1,600,000; Russia in Europe, 2,612,179; Turkey, 150,000; Roumania, 247,424; Morocco, 340,000; Denmark, Belgium, Sweden, Switzerland, Canada have comparatively few Jews—they number there from 1,500 to 7,000.—while Asia has 2,138,000. Most persons will be surprised at the statement that there are less than 73,300 Jews in this country, which is generally supposed to contain a great many more. Some reports made the number as high as 150,000; but this is probably an exaggeration. The statistics given here are said to be as trustworthy as can be had at present, though no published figures can be wholly depended on, as the Jews are scattered all over the globe, and in many places where such a thing as a census has never been taken. The Jewish population of the world is loosely estimated at from 3,500,000 to 15,000,000—a very broad margin surely—but there is reason to believe that 8,000,000 is pretty near the truth. The two countries where Jews are scarcest are Spain and Scotland.

THE TROY (N. Y.) clergymen have adopted resolutions recommending that at funerals all unnecessary expense, such as an exhibition of flowers and a distribution of crape and gloves, be avoided, and that there be a brief and simple burial service. They also suggest a consultation with the officiating clergymen before the time and place of service is fixed, private funerals and a discountenancing of long-continued mourning.

RECENT LITERATURE.

England from a Back Window. By J. M. BAILEY, the Danbury News Man. Boston: Lee & Shepard.

MR. BAILEY is a captivating traveling companion. He is a keen observer, and his comments on the manners, customs and people of England are most entertaining. The book fairly overflows with humor that is as enjoyable as it is spontaneous. There's not a line of manufactured fun in it, but the reader finds an account of a drive or of a visit to a ruined castle, made irresistibly comic by the happy turn of a phrase. Mr. Bailey is quaintly funny, and his drollery is genuine wit, for it depends on neither crude spelling nor puns for its effect. As this book is both instructive and amusing, it is especially well adapted for reading aloud in the home circle, and many an otherwise cheerless evening may be made thoroughly delightful by glimpses through Mr. Bailey's "Back Window." Any one can have a "peep" by sending $1 to the publishers.

Pretty Little Countess Zina. A Russian Story. By HENRY GRENVILLE. Translated by MARY NEAL BURKWOOD. Philadelphia: T. B. Peterson & Bros. Price 75 cents.

THIS novel is pleasantly readable, and although the situations are not particularly strong, the current of excitement is rather more intense than is usual in high life society stories. The little Countess captivates by her ingenious and sometimes daring schemes in protecting her subdued but determined cousin. Her mother, the Countess Koumiassine, who is severe, but conscientiously arbitrary, furnishes abundant opportunity for strategic behavior on the part of her household. Of course, love and marriage are the golden hinges of the story, and the *denouement* is sufficiently withheld to give piquancy to the plot. The translation is exceedingly clever, the original evidently not having materially lost in the operation.

Davies and Peck's Elementary Arithmetic. New York: A. S. Barnes & Co. 60 cents.

THIS book, designed as the introductory volume of the Two-Book Course of Davies and Peck, is especially adapted to beginners. It is suited to the capacity of any child old enough to begin the study of arithmetic, and the subjects are treated in an interesting and attractive manner, while comprehensive definitions introduce each subject. The book may be said to be divided into five parts; the first consists of easy, simple lessons in numbers; second, fundamental operations, followed by general principles and properties of numbers; third, Fractions, Currency and the Metric System; fourth, Compound Numbers and Reduction; while Percentage, Interest, Discount, &c., occupy the closing pages of the book. Among the methods of performing examples, that of computing interest by aliquot parts is specially commendable.

The Boy Trapper. By HARRY CASTLEMON. Philadelphia: Porter & Coates.

THE boys who read and enjoyed Buried Treasure, to which this book is a sequel, will be glad to meet again some of the characters as old acquaintances, and to follow them through new scenes and adventures equally as interesting as those they have already witnessed. The author has a pleasant and natural way of telling stories which cannot fail to entertain his young readers.

A 16-PAGE quarterly, the Eclipse Era, is a new launch in a channel that seems of late to be filled with literary ventures of the same character. It is reasonably well filled with elegant extracts from the contemporary press, mostly without credit, and it finally concludes with a disquisition on the merits of some particular piece of mechanism, between the owners of which and the owners of the paper there seems to be no distinction; in fact, it is hard to determine whether the paper is intended to enlighten mankind on current literature or the beauties of steam on the farm. You may know for ourself at 20 cents a year.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

AN OLD STORY.

THEY stood alone in the light of the West,
He said that he loved her well.
He loved her well, but she loved the best—
There were none but the birds to tell.
"Sweet day," sang they——
"Sweet, sweet day!"

The bluebells were nodding in the green glen,
The waters were laughing a song,
The birds were telling the deeds of men
When the world knew never a wrong:
"Sweet day," sang they—
"Sweet, sweet day!"

He whispered low in her willing ear,
"Thou art dearer than life to me:"
There were none but the laughing waters to hear,
And none but the birds to see;
"Sweet day," sang they—
"Sweet, sweet day!"

The bluebells laid their fair heads to rest,
The birds flew over the wave,
The heart of the woman who loved the best
Lay mute in a silent grave!
For the love of the man who loved her well
Lived but the life of a fair bluebell!

THE WOMAN'S CLUB.

DEAR "CLUB"-ITES:—I do think this is the funniest Club I ever heard of. We women are supposed to meet once a month for the discussion of any and all topics likely to interest feminines, but the drollest part of it is, we *don't* discuss. Each writer discharges her load of ideas and retires without provoking any return fire. I've a theory that most of the women of the RURAL don't read the Club at all, but that those of them who have anything to say just use the Club for the purpose of advertising their ideas, not knowing or caring whether anybody is benefited or entertained by their writings. I propose to amuse myself in the same way. So here goes.

It may not be etiquette to criticise Club letters, but I think two or three rousing disagreements would enliven our meetings wonderfully, and beside, I think some articles (and their writers) are good subjects for hostile criticism. Now there's Free Lance. I think he is an insufferable prig (shouldn't wonder if he wore eye-glasses, parted his hair in the middle and affected the Dundreary drawl). He is forever nagging at us women. A long while ago he accused us of being dirty about feather beds; this brought out May Maple, who gave him what the little boys call "Hail Columbia." He subsided, and staid so, until Ermengarde ventured to assert that women would purify politics if the right of suffrage were granted them, when lo! F. L. arose in his might and protested that women were not nearly so good as was popularly supposed. After this chivalrous outburst he went into retirement, but I find in the RURAL of 4th January, he comes once again to the front. He rates women soundly for being interested in eating and dressing, and wants us to run to intellect or to Boston, which amounts to the same thing. Free Lance, you dear boy, don't you know we hunt up all the "goody" recipes so as to make toothsome concoctions for the lord and master? Exit F. L. Now, I want to enter an objection or two against Margaret B. Harvey's eulogy of black silk dresses. I disagree entirely with her that a black silk is a good investment unless one has another good dress. But to purchase a black silk for wear at church, receptions, theatre and for visiting is a bad speculation. It's a dress suitable for many occasions, but unfortunately, it isn't as durable as it is convenient. I've bought French and American silks, had 'em made long and short, and my experience is that for durability, a Cashmere is infinitely preferable. To be sure, it isn't so dressy, but what is more dowdy than a black silk that has lost its pristine freshness? Have your silk if you want to, girls, but be sure and provide yourselves with a second dress to save it.

A writer in last Club wants something said about temperance, and she avows herself as an advocate of fighting the liquor question at the polls. I don't see why temperance should have anything to do with politics. This is a moral reform, and we want to persuade men to be temperate. Christ was a reformer, and yet did He ever say to His followers that they should try to wire-pull in the council chambers of Judea, in order to force men to accept his gospel? The trouble with most reformers is, that they are in such hot haste to convert the world to their ideas that they cannot wait until men reason over the matter, but they want to insist on their reform notions being adopted or to be able to invoke the terrors of the law against those who hesitate. Have a little patience, my reform friends. I *could* say more, but I fear the editor may object to such an effusive letter.

WASHTENAW.

SHORT SKIRTS.

MADAM Anderson, the professional pedestrian, who accomplished the stupendous feat of walking 2700 quarter miles in 2700 quarter hours, wore her skirts to her knees. *She* could not afford to be hampered with even the average walking skirt, and I wonder if her sisters can afford to go through life penned in and dragged down by petticoats! My object in drawing attention to the costume of this famous little lady is not to urge on women the adoption of knee skirts, exactly, but to bring to their notice the terrible wear and tear of skirts. Women regard the walking dress as a great boon. It is, but it doesn't go far enough or rather it goes too far——down. Even a single skirt moderately short and plain though it be, impedes the free movements of the legs. If you doubt this, put on a gymnastic costume, or better still, slip off all your skirts except the short white one and make a tour of your room. Notice what a delicious sense of freedom you enjoy. Probably you never before realized the tyranny of skirts, and now that you do realize it, will you continue to hang yards of material from your waist to the agony of your back and the discomfort of your heels? Why a woman should be compelled to drag her life out of her for the sake of keeping her ankles covered, I never could understand. The most cultured and critical society permits and encourages women to appear at entertainments with toilettes so excessively *decolette*, as to be positively immodest, and yet a skirt which displays the foot and ankle of the wearer, is pronounced immoral!! One benefit resulting from the (deservedly) much abused pull-back style, is that by it many women have been taught there is no occasion for two or three petticoats under the dress skirt. Worth, the man dressmaker, calls the dress of the Persian women the "ideal costume," and recommends it for its elegance and comfort. Well, it isn't my ideal. The blouse and short skirt are good, but the baggy trousers are simply intolerable, both as a spectacle and for ease. Why can't pantaloons for women be modelled after those which are at present fashionable for small boys? RURAL sisters, can't you, won't you begin a skirt reform? JICKS.

WAS SHE TO BE COMMENDED?

A RELIGIOUS newspaper lately went into pious ecstasies over a young girl who, though compelled to earn her living by hard work at machine sewing, yet contrived by dint of denying herself all but the barest necessaries of life, to contribute quite liberally to a fund for the erection of a church edifice. The periodical aforesaid praised the girl most lavishly and held her's up as an example worthy of imitation.

I question whether she ought not to be severely censured for such a course of conduct. Girls who support themselves by taking in sewing do not fare at all sumptuously if they have work all the year round (which is of rare occurrence) and when they expend all of their meagre earnings on themselves. To say of a girl of this class that she confines her expenditures to "bare necessities" means that she lives on bread and tea, goes without proper underclothing, and denies herself the comfortable wrap which she needs to protect her from cold and storms. She moreover leaves herself without any reserve fund, and when work is slack, or when it stops altogether, how is she to subsist? If sickness overtakes her she is compelled to go the hospital and add one more to the host who, through ignorance, vice and indolence have become burdens on the public. Burdens which you, my thrifty friends, are taxed to support. It is the self-respecting, self-denying and frugal in the community who are taxed for the maintenance of hospitals, prisons and alms-houses. Has any one a right to increase the pauper class or to recommend measures which will land those who adopt them in eleemosynary institutions? Besides being a burden the poor girl will not have the care and attention she would receive at a private house. She will be very much at the mercy of doctors and nurses, who are not always the most humane of people. Most likely she will be experimented on by half-fledged physicians, and subjected to treatment which, although perfectly legitimate, cannot fail to be extremely distasteful to a woman, however low in the scale of refinement she may be. And the object of all this self-sacrifice is what? To clothe the naked or feed the starving? No, it is that a certain congregation may have a fine building in which to hold its services!

You, my Protestant reader, need not complacently say "yes; it's really shocking for the Roman church to grind the poor as they do," for in this instance it was a *Protestant* church for which this girl starved herself. And then they have the effrontery to call this "giving to the Lord." Where in the Bible is it commanded or even intimated that costly churches are a necessity or that they are particularly desirable; and where is the chapter and verse wherein we are enjoined to reduce ourselves to abject poverty in order that the "Temple of the Lord" may be beautified? "Giving to the Lord," indeed! It's vanity and pride and not righteousness which dedicates piles of marble and stone that cost from fifty thousand to one million dollars to the service of God.

Christ could be content with "upper rooms," but we of this century must have our marble-fronted buildings finished with stained-glass windows, costly altar-pieces and expensive upholstery. We count it, too, as a thing worthy of all commendation that the poor should starve their bodies and their minds in order that our church edifices may be artistically frescoed and provided with all the modern requirements of elegant worship.

"Giving to the Lord!" It's rank blasphemy to say that. JACQUELINA.

HIS MOTHER.

J. M. M'C.

"I AM so glad to see you, Aunt Cynthia," said little Mrs. Pryor, as she greeted the good, motherly, old maid with a half tearful kiss. "Come right into the sitting-room. I have moved the cradle in there, it is so much cooler."

"I hope baby isn't very sick?" said auntie kindly.

"I don't know just how sick he is, as I am not much used to babies. I was up with him all night and he was very restless."

"Poor little feller!" said auntie tenderly, as she lifted the hot baby to her ample lap. "Just bring a basin of water and some soft towels and a little blanket, and we will soon make him more comfortable." Aunt Cynthia speedily rolled him in a towel wrung out of warm water, and then wrapping the little flannel blanket smoothly and snugly about him soon "hush-a-byed" him into a quiet sleep. But the young mother's face did not lighten as it ought, even though her baby seemed so much relieved.

"I don't mind telling you, auntie," she said, in answer to a kind inquiry; "but John thinks I can keep the house and the table up to the old standard and take care of a sick baby too. He said his mother brought up nine children and always did her own work, and spinning, knitting and sewing besides. She even wove a rag carpet once on a neighbor's loom."

"John is a goose, my dear," said auntie placidly. "I know him like a book and his mother before him. He is well enough disposed, as men go, but his judgment about woman's work is about on an average with that of most men's. He was the fifth of those nine children, and before he was old enough to notice how things went on, Martha and Sabina were able to take a good share of the work on their stout shoulders. And they did it. Seth and John had plenty of steps to take before they were six years old, and so did all the rest. They saved as much work as they made from that time on. John's mother was an excellent, capable woman, but she wasn't perfect any more than you or I, and she didn't pretend to be. If she was living she would take John in hand and set him right about her early housekeeping days, and she would comfort your heart by telling you just what a hard time she had to get on when Martha was a baby, and how her John used to tell how it was with his perfect mother. They have a great deal more sense at forty than they have at twenty-five, dear, you'll find it so. Then John will begin to brag everywhere how my wife manages. It will all come right, Nelly, only have faith and patience. I'll have a good, quiet talk with John, and it will do him good. He will take it well from his old auntie, and don't you ever worry any more about these perfect mothers. I've seen the inside of a great many homes in my day, and the young mothers I have known were glad to get along just as you do, the best way they could. That is all that any of us can.

A great many conscientious little women are burdened with the self-accusation that they are not doing as well as they might, because they do not come up to a mother-in-law's standard. But if they could have gone through those same establishments when the babies were taking their degrees in teething, measles and chicken-pox, they would sit down with a smile of content in their own homes, and think they were not so much worse off than other people after all. Take for your comfort the assurance that your son will hold you up in just the same way to some little wife when the time comes around."

THE WALKING MANIA!

OH, why did Madame Anderson walk so much and so fast, and thus furnish a new test for men to homilize about for the benefit of women!

Since this plucky woman brought her undertaking to a successful issue, the press has fairly bristled with arguments and conclusions drawn from her extraordinary performance, and have striven to prove by it that unlimited walking, is to be the grand panacea for all the ills of womanly flesh.

I wish to mildly protest against this wild Walking Crusade; a moderate amount of exercise is not only beneficial for most people, but it is really necessary for their health's sake; but there are many who will be seriously injured if they become infected with the pedestrian mania, and take to tramping for health.

It is a question which each should decide for himself and herself. Very many women ought never to walk more than a quarter of a mile at a time; they should be in the open air and sunshine as much as practicable, but never should they permit themselves to be tempted into taking long walks. They can take a sunning in their rooms in the winter, or on the piazza, doorsteps or in the yard in summer. There are beside women whose lives are too full of hard toil to make walking either pleasant or beneficial. They would employ their time much more profitably if they ensconced themselves in easy chairs, or on lounges and "took a nap." In many forms of nervous diseases, rest is preferable to exercise. Men and women are often obliged to work all day in stores and offices, and when night comes, in most cases, bed and not walking should be recommended.

However, as I said before, each one should be his own judge in the matter. Only do not become so possessed of the "tramp" fever as to lose sight of all reasonableness in the matter. HYGIENE.

AN INTEMPERATE ASSERTION.

IN a recent discourse Prof. Felix Adler, a gentleman of culture, who lectures before a society of Rationalists every Sunday, made a statement to the effect that "poverty caused intemperance and not intemperance poverty." That many men are cowardly enough to seek the warmth and the doubtful attractions of the dram-shop because of the wretchedness of their homes, will not probably be disputed, but as intemperance is not confined to the poor, on what hypothesis does the brilliant Mr. Adler account for inebriety among those who have enough and to spare of the luxuries of life? The superbly fitted up wine-rooms which are a disgrace to our large cities are not supported by poverty but by wealth. It is a common occurrence for men to drink up their fortunes and reduce their families and themselves to want. What has Mr. Adler to say of such cases; is poverty or liquor drinking responsible for such a deplorable state of affairs? As well might one defend infanticide or homicide, on the ground of the man's not being able to provide for his child or wife as to excuse wine bibbing because a man is poor.

AN ANTI-RATIONALIST.

A TOBACCO GRIEVANCE.

I DO not know whether I am justified in ventilating my personal grievances in the columns of the Club, or in hoping for any suggestions in response tending to their alleviation. I have noticed nothing so far satisfactory as to removing the dreadful necessity of dish washing so bitterly complained of not long since. My grievance is that my husband is confirmed in an inveterate use of tobacco in every shape and to me. My little boy is growing up and I look forward with dread to the influence of his father's example upon him. It strikes me as being a terribly sad thing that a mother should dread her husband's influence upon her child, but it is probably not a singular case, and I should like to hear some views on the subject. MATRIX.

News of the Week.

Monday, Jan. 27, 1879.

MISCELLANEOUS.

Joseph N. Sturtevant, born April 1, 1844; died January 19, 1879. He has appeared before the public as one of the authors of "The Dairy Cow, Ayrshire," as one of the editors of the "North American Ayrshire Register," and as contributor to our various agricultural papers, under several *noms de plume*, such as J. N. S., Zelco, Alex. B., etc. His writings, the work of a few well moments, in a life which struggled with ill-health from its commencement, have made an impress upon agricultural thought which shall continue, even if the originator be unrecognized and forgotten. Honest in thought as in action, caring nothing for applause, a true philanthropist in all that constitutes the word, a careful thinker, considerate towards the opinions of others, and yet possessing a positiveness of character which came through conviction, his advice was often sought and seldom unheeded. Without personal vanity, as delicate as a woman towards the rights of others, with a mind trained to goodness for its own sake, one who believed in good because of the good, and hated evil because of the evil, he has left behind him many sorrowing friends beyond the circle of his intimate associates.

The trio at Waushakum Farm is now broken. Three brothers purchased the farm and formed one life in 1867, and for eleven years there have been harmonious thought and action—and now—and now—a wearying sense of desolation, which elicits our warm sympathy.

There were killed and marketed in the United States last year forty million fat hogs. The Senate committee on judiciary has agreed to report a bill defining polygamy, and providing that any person believing in polygamy shall be disqualified from jury duty. Silkworms of the value of $1,600,000 have just passed over our Pacific railroad, on their way from China to France. Caleb Cushing left property estimated as worth $1,000,000. Prominent orchardists from various parts of Iowa, report that the cold weather has killed the fruit buds on cherry, plum and peach trees, and killed all the grape vines, except the Concords, which are also badly damaged. Fitzhugh, the "bigger man than old Grant," is doorkeeper of the Texas Senate, where he is trying to be a "bigger man than old Hubbard." The Oil City Derrick's report of petroleum production shows the total outputs of the year 1878 to have reached the enormous figure of 13,752,156 barrels.

The Memphis Appeal notices that while there are 20,000,000 acres of land in Tennessee unoccupied and untilled, strong men are begging from house to house in that city for employment. The California Beet-Sugar Company are now working up sixty-four tons of beets per day. They expect to run through this working season not less than 19,000 tons of beets. In 1869 the United States imported paper to the amount of $527,465, and exported none worth mentioning. The last yearly statistics give only $135,487 worth of imports against $1,103,318 of exported paper. Thus far twenty-two persons alleged to have been members of the Molly Maguire order have been sentenced to death in Pennsylvania, and of the number nineteen have been executed. There were 193 deaths from scarlet fever in New York city during the past week, against 273 the week before. This decrease is due to the efforts of the health department in isolating cases and keeping the infection out of the schools.

It is reported, doubtless correctly, that the Berlin mission has been tendered to Hon. Andrew D. White of the Cornell University, and is now held under advisement by him. It would be difficult for the administration to find, in this country, a man who is better fitted, by culture and character, to be the successor of Bayard Taylor. Castor oil is becoming an important product in British India. Last year there were 67,000 acres devoted to it in Madras. It has been cultivated with success in Iowa. Iroquois County, Ill., has 200 artesians wells, all of small bore, within a radius of twenty miles. No one of them exceeds 75 feet in depth and they yield a total daily supply of 53,500,000 gallons.

Beechwood is one of the best materials for making butter boxes for grocers' uses. They are made by the million, and sold at from twenty to seventy cents per hundred, according to size.

It is estimated that the pension arrearages bill which Congress has passed, and which was signed by the President on Saturday last will take from fifty to one hundred million dollars out of the Federal Treasury. Frank Work's noted trotter, Modoc, bought for $8,000 in Lansingburg four years ago, fell dead in Central Park, Monday.

The miserable band of Cheyenne Indians that escaped from Fort Robinson as related last week, have all been killed or captured. They declared they would rather die than return to the Indian Territory and the paternal superintendence of the Indian agent, and all except seventeen, chiefly squaws and papooses, have kept their word. The Committee of the House, who have been investigating the advisability of the transfer of the Indian Bureau from the Interior to the War Department, are evenly divided in opinion—half of them strongly advocate the transfer while the other half oppose it, but put it in the President's discretion to so transfer turbulent tribes temporarily.

The amount of cider made this season in New England is unprecedented, the yield in western Massachusetts being calculated at 150,000 barrels, and some of the cider mills are still running. What to do with the liquid is a puzzle to the farmers. The use of what are called "grater" mills, which cut the apples instead of crushing them, increases the yield of cider, but is said to lower the quality. The average quantity of apples necessary to make a barrel of cider is ten bushels, and the mill charge is thirty cents a barrel. The present price of good cider is $2.50 at the mills. Some farmers have used their cisterns for storage. In the Massachusetts Legislature a bill is under consideration which provides that tramps shall be punished by imprisonment at hard labor for one year, and that "any tramp who shall enter any dwelling house or any unoccupied building, or kindle any fire in the highway or on the land of another, without the consent of the occupant or owner thereof, or shall be found carrying any firearms or other dangerous weapon, or shall threaten to do any injury to the person or property of another, shall be punished by imprisonment at hard labor in the house of correction or State workhouse for not more than two years." The enactment is not applicable to any female, to a minor under 16 years of ago, to any blind person, nor any person who has a certificate of respectable character from the Selectmen of the town of which he was last an inhabitant. Legistion of somewhat the same nature is urgently required in other States also.

A Washington correspondent says there have been distributed during the year drawing to a close from the Department of Agriculture over fifty thousand young tea plants, and as many more will be distributed during the coming year. Commissioner Ledue is sanguine that tea can be cheaply and profitably grown in the Southern States.

Judge James B. McKean, whose hatred of polygamy gained for him the name of "the Mission Jurist," died in Salt Lake City the other day. It was Judge McKean who first refused the right of citizenship to Mormons believing in plural marriages, and who gave the alimony to Ann Eliza Young. His death is a misfortune to those who are beginning a great fight against the Mormon power in Utah, for he would have been a leader.

FOREIGN.

Across the Atlantic distress is still growing in England. One after another the discontented strikers are forced to resume work at reduced wages by hard times and starvation. Many of the most prominent statesman are urging emigration as a remedy for the surplus of labor. A very large number of the landlords are returning from ten to fifteen per cent to their tenants on the half year's rent, and lowering rents for the next year. As if in mocking contrast to the spectacles of penury and want everywhere seen throughout the land, fashion and wealth never indulged in more expensive freaks than at present. The papers that detail in one column, starvation and misery among the vast body of operative, devote the next couple of columns to "hifalutin" accounts of the extravagant doings of the "upper crust." The opposition to free trade is growing stronger daily, especially among the agricultural classes, who find their labors unprofitable on account of foreign competition. American grain and meat can be put down in England at lower figures than those at which they can be produced at home, so that the farmer's occupation is in danger of collapsing. If the present laws continue in force it may be that the land in England will become merely a market garden for the supply of perishable vegetables, with here and there vast parks for the amusement and dignity of the great aristocracy and plutocracy.

In France a compromise has been effected between the Administration and Republican party who threatened to upset the Cabinet. The latter has, accordingly, obtained a vote of confidence by a heavy majority. Only the Radical republicans voted against them. Gambetta took no part in the struggle openly, but his forbearance was the cause of the Government's success. Six of the chief generals, who command divisions of the army in as many departments, are to be put on the retired list. They are men known to be in favor of the restoration of the Empire, and their places will be filled by pronounced republicans. A large number of civil functionaries who have retained their offices from the days of Napoleon the III. and are still friendly to his son, will also be replaced by men of decidedly republican opinions. In Germany Bismarck is said to be losing some part of his vast influence, on account of his reactionary measures. He seems determined to force upon the country a protective tariff, and has appealed to the agricultural community to support him in levying a tax on all foreign agricultural products in order to raise the price of their own. Such a measure would seriously hurt our trade in grain with the Fatherland. He is also seriously resolved on an act authorizing the opening of all letters crossing the frontier from foreign countries. In Turkey financial distress is becoming more dangerous daily. A definite treaty has been concluded with Russia, and now only awaits the approval of the Czar and the Sultan. The island of Cyprus, it is reported, is to be sold outright to Great Britain for $5,000,000.

The plague is spreading rapidly throughout Asiatic Russia, and an International Convention has just been held in Vienna with a view to concert measures to prevent its spread into Europe. Austria is to establish a strict quarantine against Eastern Russia, and Germany has 80,000 troops ready to form a cordon along the Muscovite frontier, so as to prevent all intercourse, should such a measure become necessary. Yakoob Khan has not yet fled, as reported last week, but his turbulent chiefs are rapidly deserting his standard, and when spring allows the renewal of active warlike operations, it is probable that no opposition will be made to the British. The Ameer is hid from public sight and knowledge somewhere in the vast regions of Asiatic Russia.

A few years ago the French Government bought seven small railways. One management now takes the place of seven, the force is better organized, sinecures have been abolished, and the general expenses have been reduced by $200,000 a year. The trial of Passanante, the would-be assassin of King Humbert, has been postponed to February, on a plea of emotional insanity, in order that the doctors may examine the state of his mind. The Geographical Society of Paris has taken the initiatory steps toward forming an emigration society, which will give information to those desiring to emigrate regarding all sections of the civilized world. It will describe the advantages and disadvantages of emigration in detail. Over 10,000 unsheltered sheep were killed by the recent storms in Scotland. The indirect taxes of France yielded 2,025,770,000 francs in 1878, an increase of 77,672,400.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

SOUTHERN ECONOMY IN KITCHEN AND DINING-ROOM.

If the friends of the RURAL would contribute more to these columns, not only of suggestions and queries as to their conveniences and necessities, but of results actually accomplished, it would make this Department much more attractive and profitable. I thank Mrs. Annie L. Jack and May Maple for what they have done, but there is still a great want, especially for us dependent Southerners, which has not yet been fully reached. In *ante-bellum* days we had, in a great measure, the labors of the house and kitchen done for us, but now, to a great extent, we must do them for ourselves, or rather, they must be done by our wives and daughters, who, God bless them! are accommodating themselves to the changed condition of affairs with a cheerfulness and will worthy of all praise. Indeed, they are so willing that we "men folks" are ashamed that we do not know how to furnish them with all the necessary conveniences and appliances for saving labor and toil. But it is an old saw that necessity is the mother of invention, and we have found it to be true. After the war, our servants, wishing to test and enjoy their freedom, very generally refused to hire, and under the old *régime*, all our out-door conveniences—our kitchen, smoke-house, well, and wood-pile—were a considerable distance away from the "big house"—as the negroes called the family dwelling. So, it was no small labor for the wife and daughter to make the daily, aye, almost the hourly circuit of these buildings.

In this extremity my wits came to my aid, and I moved up for my "folks" a double framed cabin which had been a servants' house, to the rear of my dwelling, for a family dining-room and cook room, making a covered passage-way from the one to the other. To the side of this I built a shed room, with doors opening into dining-room and kitchen, to be used as a pantry and general store-room. In the cook room I made a tank for water to be used during the day, to be filled from the outside; a sink for kitchen purposes; and put up a common farmer's boiler for heating water for washing, or any other purpose wanted. Between the cook room and the dining-room, on one side of the double chimney, I constructed a dumb-waiter, made in the shape of a long, shallow box, about eighteen inches wide, and three feet long, so that it could be easily slided from one room to the other, on a frame, through an opening in the partition, so that when the cook dished the meal, it could be easily and most conveniently transferred to the dining-room and placed upon the table, thus securing a hot meal, and dispensing with the necessity of a servant or two.

But in the dining-room was my most happy expedient. It was a dining table, the like of which may have been in use elsewhere, but I never had seen or heard of one. It is a round table, with another round table or leaf about five inches above the first, and made to revolve on an axis going through the middle of the lower table, and terminating in a socket in a piece of thick board fastened across the bottom of the lower table. The first table is six feet in diameter, and the top four feet, leaving room on the first table for the empty plates, knives and forks, cups, goblets, etc., there being a space all round of two feet, and room under the top table for storing the soup plates after they have been used, and for receiving other table "fixings," so as to make room for the dessert.

Now for the *modus operandi*. The cloth is made with a hole in the middle, with a slit from the hole, so that it can readily be put on without removing the top table. On the latter, which should be of walnut or mahogany, mats for the dishes can be used, or an oil-cloth cut round and a narrow band round it, can be made, and answers the purpose well. After the cloth is laid, the table can be fully set, and there is no further necessity for any waiting. The soup can be dished by the mistress, placed upon the revolving table, and passed round to every guest much more easily and handily than by any other process, and at the same time the viands are passed in review before every one. After soup is through with, the empty plate is simply shoved under the revolving table, out of sight, and each guest is ready to help himself to anything that suits his condition or appetite, without the necessity of anything being pressed upon him. In the same way the plates can be removed and the dessert served, and a waiter need not be in the room during the whole course of dinner.

A table, such as I have described, will comfortably seat twelve persons, and, if very round, will give them plenty of elbow-room, a desideratum always felt upon sitting down to a good dinner; for a fair start and elbow-room are all that one wants on such an occasion. But there is still another excellence about this table which commends itself at once to our lady friends—it makes a most beautiful center table for a wedding, or other festive collation. Place two tables as wings, on opposite sides, and ornament the center with silver, glass, china, etc., and place on them fruits, flowers and other delicacies, such as will at once occur to our fair friends, and the effect is charming.

Now, Mrs. Maple, since we are all in the family again, we need not feel any sensitiveness in opening our back doors and showing our friends about in our back yards. You see how I have done this, and I do hope that some one or more of your readers will follow my example, and tell us how we may improve our mode of living. Tell us what conveniences you have to save time and severe toil, and to make the drudgery of the kitchen more bearable. Do tell us how you live below stairs. With high life above stairs we all affect, at least, to be well acquainted, but very few pretend to know about the kitchen, while the kitchen and its affairs make up one half of our lives, and are provocative of more domestic disquietude than all other causes put together.

Glenn Springs, S. C. J. WIST S.

DOMESTIC RECIPES.

Brussels-Sprouts

WASH and look over very carefully; put on with plenty of boiling water and a little salt and cook twenty minutes, after the water again boils; drain well and pile high upon a dish with drawn butter poured over them. Garnish with poached eggs.

Parsnips with Cream Sauce.

Scrape, boil and slice lengthwise. Put into a frying-pan two tablespoonfuls of butter with pepper and salt. When the butter melts put in the parsnips, shake and turn until very hot; take out the slices upon a dish; add to the butter in the pan, half a teacupful of cream; boil up and pour over the sliced parsnips.

Beef's Heart.

Wash well, lay in salt and water for an hour, take out and wipe dry. Prepare a force-meat of bread crumbs, seasoned with pepper, salt, minced onions and salt pork; stuff the heart with this mixture and sew up in a thin cloth. Boil slowly for an hour and a half—the water should be allowed to boil away so there will be only enough left for gravy; take up, undo the cloth and put into the oven to finish. Baste often and turn the heart around as it browns. Thicken the gravy with a spoonful of butter mixed with the same quantity of flour; boil up, season, add the juice of a lemon and pour over the heart. MARY B.

Split Pea-Soup.

Soak a pint of split peas in water over night; in the morning turn off and add warm water; throw this off after an hour and cover the peas with four quarts of cold water; add two pounds of beef, with some bones well cracked and two or three stalks of celery cut fine; boil or simmer four hours; then strain through a colander, rubbing the peas, celery and meat through the holes until nothing more will pass; season with pepper and salt; add the juice of a lemon; return to the kettle, boil up and pour into the tureen over bits of toasted bread

E. M.

Canned Apples.

I saw an estimable lady lately putting stewed green apples into cans. While the fruit retains its full flavor, she prepares the apples, stewing as for sauce, and putting into cans without sweetening. She tells me they are excellent in the spring for pies, tasting fresh and new, while the apples in the cellar are partly decayed, rendering them poor for cooking.

AUNT EM.

Carpet Sweepers.

My husband gave me a sweeper for a Christmas present, or as Gertie says, "Santa Claus brought it!" With this much experience, I can say it is a magical labor-saving affair. It runs quietly and easily, and takes up all dirt except in corners, where a broom is needed to brush out for a few inches. I cannot say whether it is hard upon carpets, but I know it is not on the back. It saves much valuable time in the morning, besides it does away with the layer of dust on everything, to say nothing of what one inhales when a broom is used.

MRS. M. L. S.

QUESTIONS ANSWERED.

Reader wants a recipe for coloring dark brown, durable on cotton; also, one for red.

ANS.—For brown: take four pounds of cutch, five ounces of blue vitriol, and nine ounces of bichromate of potash for twenty pounds of cloth; boil the cutch in as much water as will cover the goods, and when the cutch is well dissolved, add the blue vitriol; put the goods in and let stand all night; in the morning dissolve one-half of the bichromate in hot water, put the goods into it and let stand for fifteen

minutes; air and wash off. Warm up the cutch water used the day before and again put in the cotton; let it stand until the next morning, then put through boiling water in which the remaining bichromate has been dissolved; wash out and finish in soap and water. Or, make a purple dye of extract of logwood and alum and a yellow dye of fustic; dip the goods into the purple dye, then into a tartaric acid water, and then into the yellow dye. Continue until you have a rich shade. For red: Boil one pound of camwood in an iron kettle; put in two or three pounds of cotton goods and let stand from one to three days according to the shade you wish. Air and heat occasionally.

A Cough, Cold, or Sore Throat should not be neglected. *"Brown's Bronchial Troches"* are a simple remedy, and will generally give immediate relief.

THE MARKETS.

PRODUCE AND PROVISIONS

NEW YORK, Saturday, Jan. 25, 1879.

BEANS AND PEAS.—There is no improvement in prices for mediums or marrows. Trade is a trifle more active, but not up to the winter style of business in mediums. While consumption is so light with the present liberal supplies, quotations will not improve. Marrows for export do not seem to be largely wanted, though the outlook last week was favorable. White kidneys and pea very quiet. Red kidneys weaker, but there has been a very prosperous and large business in them this year, and stock beans quiet. Green peas steady at $1.30@1.35. Canadian peas in bulk and bond, 73@75c.; Southern B. n. peas, $2.60@2.70 per 2 bushel bag. Medium beans, prime, $1.35@1.37½; fair to good, $1.25@1.30; marrows, prime, free on ship, $1.42@1.45; fair to good, $1.25@1.35; pea, $1.40@1.55; white kidney, $1.65@1.90; red do., choice, $2.50@2.65; fair to good, $2.35@2.50; black beans, $2.10@2.25.

Receipts of beans for week, 8,316 bushels; exports, 933 pkgs.

BUTTER.—Dealers more generally report a fair business, and the sales are running closer to receipts than for the past fortnight. The only grip of the market, however, as before is in the fine grades, and large purchasers of half tubs have not paid the extreme. Creameries are weaker; the general receipts containing very even table qualities of half tubs. This part of the season usually brings us some good parts of counties where the custom has been to hold for mid-winter. The under grades and some better have been supported to a good degree by exportation. Among the latter sales 19c. has been paid for common, 14@16c. for fair including Welsh tubs, and 20c. for a comparatively nice grade of half tubs. A large quantity of State butter remains to come forward, and the aim of sellers is to lighten the market as much as possible of all grades under fine to extra. Western dairy and ladle packed, the latter showing a marked improvement in quality, sell close to arrivals. Roll butter scarce, but not largely inquired for.

State, full dairies, special, 20@21c.; other, 17@19c.; firkin dairies, fair to prime, 15@18c.; Welsh dairies, fine full, 16@17c.; choice half tubs, 23@25c.; fair to prime do., 16@21c.; choice Welsh, 19@20c.; fair to prime, 12@17c. Choice creamery 25@27c.; best western creamery, 31c.; other, 26@30c.; early packed creamery, 17@21c.; poor State, 9@12c.; Western dairy, fine fresh, 18@20c.; fair to good, 10@15c.; factory, ladle packed, 18@20c.; good, 14@16c.; other, 7@9c.; rolls, 10@16c.; grease, 4@5c.

Receipts for week, 29,271 pkgs.; exports, 3,377 do.

BEESWAX.—Small sales are being made at 26@27c. for Western and Southern.

BROOM CORN.—All grades but the short description are plenty and easy in price. Brush and short broom choice, per lb., 5@5½c; do., common to good, 3½@4½c.; do., common to fair, 3@3½c.; red and crooked, 2@3c.

COTTON.—Has shown more activity, and closed firm at for January, 9.47@9.49c.; February, 9.49@9.50c.; March, 9.64@9.69c.; April, 9.85@9.86c.; May, 10.01@10.02c.; June, 10.13@10.14c.; July, 10.23@10.24c.; August, 10.31@10.33c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

Low Middling	8 11-16
Middling	9 1-16

CHEESE.—Shipments this week, 33,854 boxes. There has also been increased business on home trade wants, the movement taking in the low grades, or qualities to be had at from 2 to 6, and fine stock, with a generally firm temper and no absolute change in prices.

Quotations are 9@9½c. for strictly fancy; 8¼@8½c. for fine lots; 7¼@8c. for good; 4@5c. for skimmed; State, farm dairy at 8@8¼c. for fine; 7@7½c. for good to prime, Wisconsin factory, fine, 8¼@8½c.; some fancy lots to 9c.; do, good to prime, 7¾@8¼c. Western factory, fine and fancy 7¾@8¼c.; good and prime, 6@7c.; do, full skimmed, 2@5c.

Receipts for week, 14,924 boxes.

Liverpool cable 46s.

Steam to Liverpool, 40s.

DRIED FRUITS.—Shippers have taken a few lots of quarters, the desirable parcels of which are at steady prices; otherwise the market is dull, and with the exception of raspberries, which are firmer, unchanged in price.

Southern plums at 13@13½c.; State plums, 14@14½c.; Blackberries are quoted at 5@5¼c. Peaches—Peeled Georgia, at 6@7c. for poor; 8@9c. for fair to good; 10@10½c. for prime; choice North Carolina, 11¾@12½c.; good do., 8@10c.; unpeeled halves, 3@3¼c.; quarters, 3@3¼c. Pitted cherries, 20@22c. Apples—New, 2@2¼c. for southern quarters in bags.; 3¼@3½c. for good and prime sliced; do., fair at 2½@3c. State at 3@3¼c. for new sliced; and 3@3¼c. for quarters; Western at 2¾@3¼c. for new quarters. Raspberries, 27@28c.

Exports, past week, 295 bbls. apples.

FLOUR.—There have been larger supplies, and not much activity, with prices weak and irregular.

Latest prices are at $3.15@3.60 for inferior to strictly choice superfine State; $3.60@3.90 for very poor to good extra do., odd lots and lines; $3.90@4.25 for good to very choice do., and fancy lots above this; $3.10@3.60 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.00@3.20 for inferior to good shipping extra do. and $3.90@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.00@5.00; choice to fancy do at $5.00@5.75; red and amber winter wheat, very inferior to very choice trade and family, at $3.30@5.60; round hoop Ohio at $3.85@4.25, and trade and family brands of do, at $4.25@5.00, the latter rate for very choice; St. Louis, $4.00@4.75 for very poor to good extra, and $4.75@5.60 for good to choice; Minnesota clear, very inferior to fancy, at $3.50@5.00; few brands going above $4.50; Minnesota "straight," inferior to fancy at $4.40@5.60; and patent fair to strictly fancy at $5.25@8.25, few brands going above $7.50; unsound stock at from $2.00@4.75; city mill extra at $4 65@5.00 for West Indies (the latter rate for fancy in new packages); do. for England $3.85@3.80; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.50 for fair to very choice; No. 2 at $2.40@3.00 for poor to very fancy.

CORN MEAL is selling at $2.80 for Brandywine and $2.25@2.35 for yellow, Western.

EGGS.—Receipts for the week, 3,256 bbls.; do., last week, 3,875 do. The market has ruled strong most of the week. Supplies are small and the actual count is diminished by frozen stock. Frozen and cracked eggs rate half-price. Limed are again higher. Near points, fresh, 31@32c.; state, Western and Southern 29@30c.; poor Western, 24@26c.; Canada, 25@26c.; choice limed, 22@23c.; good, 20@21c.; inferior, 18@19c.

FURS AND SKINS.—Advices from the London sales report higher rates for beaver, 25 per cent.; opposum, 35 do., and muskrat 15 do. Demand here good. Black skunk easier.

Wolf, mountain		1 50@2 00
— prairie		50@ 60

Southern furs usually sell 15 to 20 per cent. below western.

FRESH FRUITS.—Favorable weather for retailers have given apples considerable activity, and sellers name higher prices for choice with more confidence. Fair grades of red fruit are now scarcer and greenings are going into use more freely. Spitzenburgs, choice, $2.12@2.50; other $1.25@1.75; Baldwins, $1.75@2; Greenings, $1.62@1 87; Boys and sweet, $1.40@1 62; poor and frost touched, 75c.@$1. Cranberries dull at the moment; stocks, however, are not large and former full rates are demanded for prime. A consignment of western arrived frozen. Florida oranges dull, a good many have latterly arrived of bad color, and buyers hold off for better supplies. For fancy use the Indian river groves are sending some beautiful high colored stock. Extra one-half barrel boxes, $3@5.50; good, $4; common $1.75@2.25; barrels, $5@8. Hickory nuts quiet at $2@2.25 for shellbarks. There is a stronger feeling on the part of holders in peanuts, but the demand does not as yet support them. Best hand-picked Va. $1.05@1.10; other 80@95c.; shelled, 4@5c. Pecan nuts, 7½@9c. Hot-house strawberries have sold at $5 per quart.

Exports of apples for week, 4,044 bbls.

GRAIN.—Wheat has shown limited export dealings, and with larger supplies by rail prices are weak and irregular.

Latest sales are of No. spring at $1 04; No. 2 spring at 98c.@$1; No. 3 spring at 91@93c.; ungraded spring at 95@98c. ungraded amber at $1.05@1 11; No. 2 amber at $1.06@1.07¼; ungraded red at $1.04@1.09½; No. 1 red at $1.10; No. 2 red at $1.09½@1.09¾; No. 3 red at $1.03½@1.04; ungraded white at $1.07@1.10½; extra white at $1.12@1.12½; white State at $1.11@1.11½; No. 1 white at $1.10½@1.10¾; No. 2 white at $1.07@1.07½; No. 3 white at $1.03¾@1.04; No. 2 amber, January option, at $1.07½; do., February option, at 1.07¾@1.07½; No. 2 red, January option, at $1.09½; do, February option, at $1.09@$1.09¾; do., March option, at $1.11. Corn is active and well sustained in price; latest sales are of steamer mixed, in lots, at 45¾@46c.; New York No 2 at 48c.; prime do. in store at 46¾@47c.; New York No. 3 at 45¾c.; ungraded mixed at 47@48c.; No. 2 white at 49@49½c.; New York No. 2 new at 45½@47c.; Jersey yellow at 45@45½c. for new; yellow Western new at 46@46½c.; New York steamer white at 46c.; No. 2, January option, at 47¾c.; do, February option, at 45¾c.; do. March option, at 45¾@46¾c.; steamer mixed, January option, at 45c.; do., February option, at 44¾c. Oats are offered lower, with fair supplies; latest sales of New York No. 1 at 31¾c.; New York No. 2 at 31@31½c.; New York No 2 white at 33¾@34c.; New York No. 3 at 30@30½c.; New York No. 3 white at 32½@33c.; New York rejected at 28¾c.; white Western at 33½@35c.; mixed do. at 31¾c.; white State at 33@35c.; New York extra white at 38@38½c.; New York No. 1 white at 35c.; No. 2 Chicago, afloat, at 31½c.; Jersey at 31c. Barley, State 6-rowed, 93c.@$1; do, 2-rowed, 78@83c.; Canadian, 97c.$1.25; malt unchanged.

HAY AND STRAW.—Prime lots of hay and long rye straw are higher, with a good trade in them.

Sales at 40@45c. for shipping, and 70@80c. for retail qualities. Straw quoted at 50@60c. for long rye, and 40@45c. for short rye, and oat at 40@45c.

Exports, for week, 486 bales. Southern demand for shipping good.

CIDER JELLY.—Vermont pure, 8c. per pound.

HONEY.—It is a rare circumstance to note honey as low as maple sugar, and a strong evidence of dull times when it does not sell at that. Single comb, Clover is down to 10@12c.; two comb, 8@10c.; buckwheat, 7@9c.; strained, 6@9c.

LEATHER.—Sales of hemlock sole at 18@20c. for light; 19@21c. for middle; 19@20c. for heavy, and 17@19c. for good damaged.

HOPS.—Shipments this week have been 1,377 bales; this shows a somewhat freer movement on export account, which is chiefly in the medium grades; prices generally are held steady.

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 10@13; New Yorks, new crop, low to fair, 7@9; Eastern, 8@13; Western, 8@13; Yearlings, 4@6; Olds, all growths, 2@3; Pacific coast, 12@15.

POULTRY AND GAME.—Live fowls and turkeys scarce and higher. The new rates, however, would not follow free deliveries. Roosters dull; old, 4@5c.; young, 6@7c.; N. J. fowls, 10@11c.; Western 9@10c.; turkeys, hen, 9@11c.; toms, 8@9c.; ducks, near by, 60@87c.; Western and Southern, 50@60c.; geese. N. J., $1.50@1.62; other, $1.12@1.37; pigeons, 25c.

Dressed poultry has a free trade only at the latter part of the week; and accumulations frozen or off in appearance are slow of sale. Prime fresh has a ready place. Western shippers are asked to note, and they will save time by the hint, that only fat dry-picked stock is wanted; lean sell no better than scalded.

Phila., dry-picked turkeys, 12@14c.; fresh New Jersey, 11½@13c.; selected Western, 11@12c.; other, 8@9c.; Phila. fowls, 10@12c.; do. chicks, 13@14½c.; nearby fresh, 11@13½c.; other, including frozen, 6@c.; Capons, 19@20c.; slips, 15@17c.; Ducks, 9@13c.; Geese, 6@10c.

Game is falling off in receipts, but there is a large quantity in store, and prices continue easy. Demand is good, and dealers expect to work off considerable stuff at the prices.

Quail, ₱ doz., 70@75c.; Grouse, trapped, ₱ pair, 60@85c.; drawn, 50@55c.; Partridges, ₱ pair, 75c.@$1; Canvas-back Ducks, $1@1.25; Red-head, 50@75c.; Mallard, 50@55c.; Black and Teal, 35@40c.; common, including Broad-bills, 20@25c.; Hares, 18@20c.; Rabbits, 13@15c.; Wild Turkeys scarce.

OIL CAKE.—Western is at $27 per ton.

SEEDS.—Clover is plenty and easy in price, quoted 6¼@6¾c. for prime western, and 6¼@6½c. for choice do.; timothy ranges at $1.20@1.30, as to quality.

TOBACCO.—Export demand is very moderate, and home trade in seedleaf continues fair. Quotations are for

PROVISIONS.—Have been a good deal excited on speculative manipulation, tending higher, but closed dull and decidedly off from the best rates of the week. Mess pork quoted at $8.00 bid and $8.20 asked for old for January; $9.70 bid and $9.85 asked for new for January; $8.05 bid and $8.25 asked for old for February; $9.75 bid and $9.90 asked for new for February; $8.15 bid and $8.40 asked for old for March; and $9.75 bid and $9.90 asked for new for March; and $9 80 bid and $9.95 asked for new for April; and May at $9.85@9.95. Bacon at 4¾c. for long clear and 5c. for short clear. Lard, western steam, at $6.47½ for spot lots; $6 40 for February delivery; $6.45 for March, $6.55 for April, and $6.60 for May. Stearine at 6¾c. for Western. Tallow at 6¾c. for prime. Beef hams at $15 for choice Western Beef, extra India mess, $30.50 for choice city brands; do., Philadelphia, $18.50@19; packet at $11@11.50; plain mess at $10@10.50; extra mess at $10.50@11.50.

SUGAR.—Refined quoted at 8¼@8¾ for hards; 7¾@8¼ for soft white and 6@7¼ for soft yellow.

VEGETABLES.—The demand for potatoes has moderated with stiff prices, but holders feel assured that buyers will have to meet them for prime grades. Onions steady, with an advance in red and yellow. Ripe tomatoes are arriving from the island of Nassau.

Nova Scotia E. Rose, bulk, or 175 lbs. to bbl., $2.87@3.12 per bbl.; Prolific and Chili red, $2.25@2.75; P. E. I. Jackson whites, $2.12@2.37; Mercers, $2@2.25; Eastern E. Rose, with bbl., $2.50@3.12; State, $3.50@3 75; fair to good, $2@2.37; do Peach Blow, choice, $2.75@3.25; common, $2.25@2.50; Peerless, choice, $2.37@2.50; poor to good, $2@2.12. Sweet potatoes, Del., kiln-dried, $2 40; other, $2@2.25; Onions White, $2 50@3; red and yellow, $2.25@2.50; Chester, $2@2.25. Hubbard and marrow squash, $2; Cabbage, $5@7 per 100. Cauliflower, bbl., $1.50@3. R. Turnips, 75@87c. Beets, 75c. Carrots, 75c.@$1. Celery, 60@75c. doz. Extras; hot-house Radishes, $3 ₱ 100 bunches; Cucumbers, $3@3.50 doz.; Mushrooms, 40@50c. ₱ lb. Lettuce, 50c.@$1 doz.

Exports, potatoes, past week, 2,750 bbls.; onions, 600.

There is some demand for seed potatoes.

WOOL.—Manufacturers still buy very moderately, but holders are indifferent, except at steady prices. Quotations are for

LIVE STOCK MARKETS

Saturday, Jan. 25, 1879.

BEEVES.—Receipts for the week, 9,500 head; do., last week, 10,168 do. A sudden want of cattle struck a lightly supplied market at the close, and the advance over Wednesday is not deemed a permanent one. The yards were cleared before noon at 8¼@9¼c. for ordinary to good steers; 9¾@10¾c. for prime to extra. This is a high starting point for grades which tells in the general average. Three premium bullocks brought 10¾c. to dress 57 lbs. Steamers to-day take 2,840 quarters of beef and 100 live cattle. Chicago beef sides, 5@6c.

COWS AND CALVES.—Market dull at $35@65; some owners have refused these rates, and have taken stock back to the country.

VEAL CALVES.—Supplies of both live and dressed are moderate, and steady rates are reported. N. J., Buck's Co., live, milk, 7@7½c.; choice, N. J., do., 7c. other, including heavy weight, 5½@6¾c.; fed, 4@5c.; grassers, 2½@3c. Dressed, prime, 8@9½c.; fair to good, 7½@8¾c.; poor, 6@7c.; frozen quoted 1c. below our above rates.

SHEEP AND LAMBS.—Receipts for the week, 13,496 head; do. last week, 17,255 do. Demand for sheep good, with better rates. Some extras have brought 6c.; fair to prime, Western, 5@5¾c.; N. J., 4¾@5½c.; ewes, 4@4¾c. Lambs, 5¾@6¾c.

SWINE.—Receipts for the week, 35,960 head; do., last week, 36,197 do. Market firm; $3.70@3.85 per 100 lbs.; good corn Ohio the standard.

Country pork light, 4¾@5¼c.; medium, 4¾@4¾c.; heavy, 4@4¾c.; city dressed, 4¾@5c.; Western 4@4¾c.

HORSFORD'S Bread Preparation
UNSURPASSED FOR MAKING
LIGHT BREAD
Biscuit, Rolls, Cake and Pastry.
It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.
The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.
It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.
Universally used and recommended by prominent Physicians.
If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.
Manufactured according to the directions of Prof. E. N. Horsford, by the Rumford Chemical Works Providence R. I.

GREAT OFFER FOR FEBRUARY.
We will during *this month dispose of* 100 PIANOS & ORGANS, at EXTRAORDINARY LOW prices for cash. SPLENDID ORGANS 2 3-5 sets of reeds, $65. 3 sets with sub Bass and Coupler $80. 2 sets $50, 1 do $40, 1 do $35. 7 Octave *all* ROSEWOOD PIANOS $30, 7 1-3 do $140, all round corners do $175, warranted SIX years. AGENTS WANTED. Illustrated Catalogues mailed. Music at half price. HORACE WATERS & SONS, Mafrs. *and* Dealers, 40 E. 14th St., N.Y.

LIGHTNING HAY KNIVES.
WEYMOUTH'S PATENT.

This Knife is the best in use for cutting down hay and straw in mow and stack, cutting fine feed from bale, cutting corn stalks for feed, cutting peat and ditching marshes.
The blade is best cast steel, spring temper, easily sharpened and is giving *universal* satisfaction. A few moments' trial will show its merits, and parties once using it are unwilling to do without it. Its sales are fast increasing for export as well as home trade, and it *seems destined* to take the place of all other Hay Knives.
They are nicely packed in boxes, one dozen each, of 50 lbs. weight, suitable for shipping by land or water to any part of the world.
Manufactured only by
HIRAM HOLT & CO.,
East Wilton, Franklin Co., Maine.
☞ For sale by the Hardware Trade generally.

Reading for the Young.

THE WHITE CEDARS.

A FABLE.

HENRY S. CLUBB.

ON a swamp near the eastern shore of Lake Michigan, there grew near together two specimens of the American Arbor Vitæ, commonly called white cedar. Their center stems were straight and their branches regular. Their foliage, however, was sparse and principally on the extremity of the branches, so that the lake breezes had but little obstruction in passing through the trees.

A gentleman who took great delight in ornamenting his grounds, marked one of these trees for removal by tying a strip of white rag to one of its branches. When he had gone this tree addressed its neighbor, saying:

"Do you see the white ribbon fluttering from my branch? It was placed there as a token of distinction in admiration for my beauty of form."

"Did you hear what the man said when he tied that rag upon your branch?" said the other tree.

"I did not understand exactly, but I heard him whispering something to his little girl."

"I heard him say he would have you removed to his garden," said the neighbor tree.

"Oh, I am afraid that will kill me."

"He appeared to be a kind gentleman by the way he lifted his little girl over the wet places, so perhaps he will not treat you so roughly as to kill you by removal. Almost any change would be better than remaining in this dull place," said Arbor Vitæ No. 2.

The next day the gentleman returned with a spade and dug around a circle, cutting off the outer roots of the tree he had marked. The tree was frightened and trembled, but stood its ground until at last every root was severed that bound it to the earth. It was then lifted from its wet bed where it had grown from a seed, placed in a wagon, and conveyed to the gentleman's grounds where a hole had been dug for its reception in some nice soft soil. It was placed upright in its new position and the soil pressed between its roots, covering them up carefully—water being thrown on to make the soil pack firmly on the roots. The soil being moist and warm, new shoots soon started, striking into and permeating the ground in every direction. Nothing was done to the branches, but they were allowed to grow a year or two so as to get accustomed to their new position.

During the second summer, however, the gentleman noticing the vigorous growth, sheared off the tip-ends of the branches. Every place where a branch-tip was sheared off two little shoots soon grew out, giving the tree a thicker foliage. The same operation was repeated on the young shoots as they gave signs of growth beyond the desired limits. For each shoot thus shortened in, two or more appeared and in four years from the time it was transplanted, the tree, instead of being so sparsely covered with foliage that the wind could pass freely through it, had become a beautiful thick evergreen, and was prized beyond all the trees in the garden for its dense foliage and compact form. Several pairs of birds had built their nests in it and these were completely hidden from the sight of passers by. Persons passing in the street frequently stopped to admire the tree, and often inquired where the proprietor obtained that magnificent evergreen, and were astonished to learn that it had been removed from a neighboring swamp, as they had never seen anything there so beautiful.

Finding how successful he had been in removing this tree from the swamp, he concluded to remove others, and among those which he removed was the one that had been neighbor to the first one. This he planted near to the other, so that they became neighbors again. At first neither recognized the other. No. 1 had not grown much larger, but was so compact and solid that it looked like a first-class nursery tree, while No. 2 had grown taller, and its branches were spread out with very little foliage on their tip ends.

The next day a breeze that came through the branches of the new-comer wafted an odor of fragrance to the naturalized tree, and it at once recognized the same peculiar perfume that used to delight it in its former life in the swamp; and gently inclining its head as the force of the wind abated, it said:

"Are you not the same tree that was my neighbor in the swamp?"

"Can that be you?" replied No. 2. "How beautifully you have thickened up since you left my neighborhood. What can have caused so great a change?"

"Oh, I have gone through a great deal to attain my present condition," said Arbor Vitæ, No. 1. "My roots were shortened, my long, graceful branches pruned, many times my tenderest parts were nipped off, which caused me intense pain. At times it seemed impossible for me to withstand such rough treatment, and I often thought I must succumb to it. But at last I perceived that the man was improving me, I gained confidence in him, and resolved to bear courageously whatever trials I might be subjected to, and now you see the result of my training in my beautiful, compact form and thick foliage. You know in the swamp I was always a little vain of my tall, stately appearance. Now I have learned the pleasure of being useful as well as beautiful; the birds have become most delightful companions to me—they build their nests in my branches, and their songs cheer me as well as please the children."

"It must be mortifying after sending out such long roots and branches to have them lopped off," said No. 2; "but if the result is to produce such a respectable looking tree as you have become, I suppose I had better submit and make the best of it as you have done, although it is harder on me than it was on you, as I am more set in my habits of growth than you were when you were transplanted."

Just as they had reached this point in their conversation, the owner came along with his little girl and showed her the two trees. He said: "Do you remember, Celia, when we were in the swamp and I tied a piece of white rag on a tree to indicate the one I intended to remove?"

"Yes," said Celia; "there were two trees together, and you chose this one because you thought it would be the easiest to remove."

"I have now brought the other tree to try if I can improve it as I did the first."

"Oh! what a difference in the two trees: one is so thin and spreading. Its branches are long and almost bare, while the one you transplanted is so thick and green that the birds build in it, and we cannot see their nests for the deep, thick foliage," and Celia clapped her hands in admiration of her favorite Arbor Vitæ. At this moment a bird flew out from its nest in search of food for its nest full of little, unfledged birdlings. "Oh, Pa, lift me up so that I can look into the nest." As she peeped in she saw four broad bills wide open in the nest. The little ones were all expecting the return of the mother-bird to drop something nice into their open mouths. This was an unexpected sight, as the last time Celia had seen the nest there were four spotted blue eggs, and now they had disappeared and the birdlies had taken their places. She clapped her hands again, and said she would fetch the little birdies something to eat.

"You had better throw it out for the old bird and she will take it to them. If you feed them yourself you may give them too much and kill them, while their mother knows exactly how much they need," said her father, putting her down.

"But I would rather feed them myself," said Celia, pouting.

"It is not always best to do as you would rather, my pet," said her papa. "You see these two trees. Just now you were praising the beauty of the one I transplanted years ago, while the other, as you say, is not so ornamental or useful either, as the birds dare not build in a tree, that would not hide their nests from the gaze of idle boys or protect them from the cold wind or hot sun. This tree which gives you so much pleasure and is admired by all who pass by, has not had its own way for three or four years. Every time it has sent out a shoot beyond the rest I have cut it off. If I had let it have its own way it would have been no better than this tree just taken from the swamp. So my pet, if you are to grow up compact and beautiful in character and useful in your life, you must submit to have your wants limited: your shoots of pride and self-will must be pruned off, every excessive growth must be moderated by culture, and in a few years you will find your character will be as completely improved, as is this tree in its appearance and utility. The tree had to submit to a good deal of pruning before it attained the solid and compact form you now so much admire. It submitted quite gracefully to all my shearing and now is the most beautiful object on the lawn. So if my darling girl will submit gracefully to the culture, and trust her father for the result, she will become not only an object of admiration to others, but a source of satisfaction and happiness to herself and the delight of all who love her."

Celia saw the point, and although she felt the rebuke, she knew her papa was right, and whenever she became unwilling to submit her will to proper control, the two White Cedars on the lawn were pointed to as reminders of the benefits to be derived from wise and careful culture.

THE MALAY SWORD-DANCE.

WHILE on a cruise among the islands of the Malayan Archipelago our ship put in at Batavia for a week's repairs. Batavia is the Dutch capital of Java, wholly under the control of Holland; and its Dutch architecture, and Dutch manners of living, make one feel as if every house had been built in far-away Amsterdam, then boxed up, people, furniture and all, and sent by ship across the waters. So, to know anything of the natives to whom this great, beautiful island originally belonged, or their habits, dress and amusements, one must visit the Malayan settlements of the interior; and a little party of us determined thus to spend the week of our ship's stay at Batavia. We had made the acquaintance of a petty chieftain, who once had been in the service of the Rajah of Djokjskarta; and for a small fee Selim introduced our party to the court of his former master. Here, one day, we had an opportunity of witnessing the "sword-dance" of the Malays, the most noted of all their national dances. Ordinarily, it is performed by some thirty or forty ten-year-old lads, who are trained to their vocation from a very early age; but who practice it in public only for a year or so, before they are set aside as no longer sufficiently light and agile for this very peculiar dance. The boys are rigged out in very fantastic costumes, their hats especially, which are fancifully adorned with the plumage of many-colored birds, intermingled with brightly gleaming jewels. The only weapons used are wooden swords; but the youthful gymnasts seem thoroughly in earnest, and rush upon one another with all the fury of real combatants, their eyes gleaming fiercely, and their dark faces glowing with excitement. They all brandish their swords with great dexterity, dealing blows sidewise, and even backward, while they are in the very act of whizzing and whirling round the room in a rapid gallopade. Their motions are not less graceful than enthusiastic; and though the company is numerous, and the turns and thrusts are sudden, none seem taken unawares; nor is there even the slightest apparent confusion. Sometimes single combats follow the general engagement, each selecting his own opponent; but the boys are so well matched in regard to size, and all are so perfectly trained, that really there seems little advantage to be gained. The grand climax of the whole affair is to force two of their leaders into a corner, surround them with a circle of crossed swords, and hold them prisoners until one or the other succeeds in gaining possession of his opponent's weapon. The victor then receives as a prize a real sword, and is thenceforth honorably discharged from further trials of his skill, while the unfortunate lad who permitted himself to be disarmed has to go through an additional season of probation. The ordinary dress of the lower class of Malays is very simple, consisting for the most part of a long, loose "sarong," or petticoat, in place of trousers, and a tight-fitting jacket of white or red cotton; but the garb of the Princes is very gorgeous. The Rajahs wore sarongs of heavy silk, jackets of velvet, richly embroidered in gold and tiny seed-pearls, and jeweled girdles that seemed all ablaze with diamonds. Both turbans and sandals were adorned in the same costly fashion; and as for the creese or serpentine dagger, without which a Malay, whatever his rank, never appears, those of the Rajahs were marvels of costly workmanship. The display of wealth in the palaces of these native chiefs was far beyond what we expected to find; but we learned afterward that Malayan "Sultans" are pirate chiefs as well; and though they don't, in person, rob or murder on the high seas, they derive enormous revenues from the piratical hordes that everywhere infest the Malay Archipelago.—*St. Nicholas.*

FROM A NORTH CAROLINA COUSIN.

DEAR UNCLE TRUE:—Since you so kindly request me to contribute to the columns of the RURAL for the benefit of the cousins, I will tell them something about my Southern home. I live on the banks of a river in the "Old North State." A beautiful flowing river, whose gentle murmur makes music to our ears, and the banks of which are green the whole year round, (when the winters are not too severe). We have many evergreen trees, such as cedar, pine and holly with its bright crimson berries, all of which present quite a contrast to the other forest trees, which at this season of the year are brown and bare, and stand shivering in the blast. The holly is especially appreciated for our Christmas decorations. We always choose a Christmas tree of holly, for we think it pretty with the bright red berries which nature has given it, before Santa Claus adds his store of treasures rare. On the south side of our river, towering far above it, and sloping almost perpendicularly down to the water's edge, is a large rock which has become famous since the Revolution. It is said that when the daring and brave Hunter was pursued by Fanning, he made his escape by riding down this steep and dangerous rock and crossing the roaming river just below. Since then it has been familiarly known as "Faith Rock," and is one of our natural curiosities which we take pleasure in showing to strangers and friends, when they visit us. It has been said that the print of the horse's hoof can be traced on the rock, but this is all tradition, which imagination tends to keep up. Should any of the little cousins visit us, we will take pleasure in helping them look for the hoof-print.

Our summers are very pleasant here, and in winter the thermometer seldom stands lower than 12 degrees above zero. Yet this is considered real cold by those who live in this Southern clime. Many plants and flowers that could not stand the Northern climate thrive and grow here all winter; but the tropical plants and rare flowers that blossom in sunny Florida, can only be kept here by giving them a great amount of care and a nice hot-house in winter. I would like to send the cousins a bouquet from my "flower house" as a New Year's greeting; instead thereof, I hope they will accept my love and best wishes, which after all are the brightest flowers that grow in the garden of the heart. Lest I weary your patience I will close, and at another time if you wish you shall hear more about the home of COUSIN "EMPSIE."

"Riverside," N. C., Jan. 17th, 1879.

A LETTER FROM OLD UNCLE MARK.

DEAR GIRLS AND BOYS:—Though I am an old friend of yours, it is so very long since I have had anything to say to you through this column, that I fear you have forgotten all about Old Uncle Mark, and perhaps some of you will disclaim all relationship with me whatever. I will say that it is not at all from lack of interest in you that I have been silent, but by reason of uncontrolable circumstances.

Uncle True has for a long time past so completely monopolized the correspondence with you, that I confess I am not a little jealous of him, and in the future I propose to share some of your honors, with your permission. I desire to renew my acquaintance with my friends of old, if they will still own me as their uncle, and to make the acquaintance of those that have joined the cousins lately. Not knowing whether or not you will care to renew our friendship and consider me in the light of an uncle as in days gone by, I shall say nothing further at this time; but if you say so, I may hereafter write you an occasional letter, and be assured that at all times, no one will be more pleased to hear from you than UNCLE MARK.

"FOOL TINGS."

ANYBODY who criticises unfinished work, and sees nothing in drill but its drolleries, will be likely to get as badly ruffled as the Dutchwoman did. The new course of instruction in gymnastics and object teaching introduced into the schools of Philadelphia is responsible for the following incident:

Indignant mother sends for "the teacher" to call at her house on her way from school. The teacher complies with the request. "Ish you de teacher of dat school vat my poy goes to?"

"Yes," meekly responds the teacher.

"Vell, I takes my poy away!" (Teacher looks in mild surprise.) "My poy come hime the other day—he behave like crazy. He frow up his hands and say, 'Dis mine eye! dis mine nose! dis my mouth!' Now, what he go to school for to learn dat? He know dat before. Anudder day he go round de house like mad; he say 'Che, che, che; pe, pe, pe; ke, ke, ke;' now what *fool tings* dat?"

The teacher tries in vain to explain that the new course requires "object teaching" and "phonic spelling."

The indignant parent only flings back the retort, "Too many fool tings; I keeps my poy at home."—*Boston Advertiser.*

Sabbath Reading.

THE WINE GLASS.

Who hath woe? Who hath sorrow?
Who hath contentions? Who
hath wounds without cause?
Who hath redness of eyes?
They that tarry long at the
wine! They that go to
seek mixed wine! Look
not thou upon the
wine when it is red,
when it giveth its
color in the
CUP;
when it
moveth itself
aright.
At
the last
it biteth like a
serpent, and stingeth like an adder.

AFTER THE REVIVAL.

REV. ALEX. B. JACK.

THERE is a Bible in England bound in solid gold. Its pages are the finest parchment, its margins are illuminated with rare and curious workmanship. It is a costly relic, the property of the British Sovereign, kept under lock and key, and guarded with untiring care. Yet, after all, it is only a dead thing, penned by the hand of some old monk, painted by the finger of some cloistered nun. There it lies entombed in its grave of glass; in itself it has no life, neither can it give life to others. It is not for a moment to be compared with the humblest Christian who lives or lodges in some lowly cottage, and who is not a dead but a living Bible. Pearls of the East, diamonds of the sea, are on the boards of that Bible; what are these to the ornaments of a meek and quiet spirit? What that dead parchment to a deathless soul and a heart instinct with life? What that ink fading and rusting beneath the eye of Time to the blood in which the Spirit dips his finger and writes living truth upon a living soul? Anybody could write a Bible. With a feather plucked from a sea-bird's wing I could write the Bible on a paper page. With iron forged in the fire I could trace the Bible on the rugged rock. But ah! to write living truth upon a living heart, that is the work of the Holy Spirit. It is only the Spirit that can write on spirit. It is only the God who created that can convert the soul.

What is true of the reading is true of the preaching of the Word. Select the most gifted minister alive, seek out the man who lives in the closest communion with God, who is skilled in reading the secrets of the human heart, and who has above all other men that electric and magnetic power by which he leads others to himself. Now, take one in whose salvation you feel a deep anxiety, and who is yet in the gall of bitterness and bonds of iniquity—send him to that minister to be converted. I know what his answer would be. His answer is in the Bible; his answer is a royal answer in more senses than one. When the servant of the Syrian came before the King of Israel with a letter, saying, I have herewith sent my servant Naaman unto thee that thou mayest recover him of his leprosy; immediately the King rent his garments, and appealing to his courtiers, cried, "Am I a God to kill and to make alive, that this man doth send to me to recover a man of leprosy?" Even so, send a man to a minister to be converted, and if that minister knows his business, if he knows what he can do, he will say, "Am I a God to kill and to make alive, that you send that sinner to me to be converted?" A minister may make an impression. He may make an impression on a dead soul, just as I can make an impression on a dead body. I have seen a corpse galvanized, so that it seemed in every limb alive and life-like. So a man gifted with the power of moving other men may raise a tide of emotion in the human heart; but it is a tide like that of ocean when raised by the wind. Its surface swells, and rolling along the beach tears the seaweed from the rocks and casts the sea-shells on the shore. The tide-dial tells me that it never penetrates the dark depths of ocean. After a heavy swell for a tide or two it soon returns to its wonted calm; and that is just the result of many a promising revival and the history of many a Sabbath day's labor.—*Observer.*

BUNYAN'S IDEA OF THE DOCTRINE OF PERSEVERANCE.

THE doctrine of perseverance is also a cross to the flesh; which is not only to begin but to hold out, not only to bid fair, and to say, would I had Heaven, but so to know Christ, put on Christ, and walk with Christ so as to come to Heaven. Indeed it is no great matter to begin to look for Heaven, to begin to seek the Lord, to begin to shun sin; O, but it is a very great matter to continue with God's approbation: "My servant Caleb," saith God, "is a man of another spirit, he hath followed me (followed me always, he hath continually followed me) fully, he shall possess the land." Almost all the many thousands of the children of Israel in their generation, fell short of perseverance when they walked from Egypt towards the land of Canaan. Indeed they went to work at first pretty willingly, but they were very short-winded, they were quickly out of breath, and in their hearts they turned back again into Egypt.

Nay, do you not see with your eyes daily, that perseverance is a very great part of the cross? why else do men so soon grow weary? I could point out a many, that after they have followed the ways of God about a twelvemonth, others it may be two, three or four (some more and some less) years, they have been beat out of wind, have taken up their lodging and rest before they have got half-way to Heaven, some in this, some in that sin; and have secretly, nay, sometimes openly said, that the way is too strait, the race too long, the religion too holy, and I cannot hold out, I can go no farther.

PERSONAL ITEMS.

Wade Hampton amuses himself by feeding his pet chickens.

Prof. Swift of Rochester, has been for years carrying on his astronomical studies in an old cider mill, but the citizens now propose to build him an observatory, the plan of which he has approved.

Some Nebraska men attempted a surprise party on Mr. Cole and family. Mr. Cole used a revolver, Mrs. Cole a shot-gun and the children threw stones, and the number of callers who limped away was thirteen.

The German Emperor is wonderfully well and vigorous, though still obliged to carry his right arm in a sling, and drives out daily, accompanied only by the Crown Prince or an equerry. All the forenoon he devotes to receiving reports and giving audiences.

One Beinert, a miller of Plauen-Dreden, Saxony, has philanthropically presented the town with money for planting cherry trees along the streets, the money to be refunded from the sale of the cherries when the trees begin to bear. Beinert was under the impression that there were no small boys in Plauen-Dreden.

New Publications.

FOR 1879.

LIPPINCOTT'S MAGAZINE,

AN ILLUSTRATED MONTHLY OF

Literature, Science, Art and Travel.

With the JANUARY number commenced the twenty-third volume and twelfth year of LIPPINCOTT'S MAGAZINE. The conductors take pleasure in stating that during the coming year they will spare no efforts to supply their patrons with a fund of

The Best and Most Attractive Reading,

aiming to furnish entertainment, in the best sense, for every diversity of taste,—to be of no class, of no party, but belonging to all and profitable to all.

The contents of the Magazine will embrace attractive

Serial Novels, Short Stories, Sketches of Travel, History and Biography, Essays on Popular Questions of the Day. Papers on Wit and Humor, Articles on Popular Science, Poems, Reviews, Etc.

OUR MONTHLY GOSSIP, always an important department of this Journal, will be carefully sustained.

The **PICTORIAL EMBELLISHMENT** of the Magazine will be a matter of careful attention, with the object of rendering it an especially attractive feature

Among the contributions that will appear in the new volume are the following:

A series of **Illustrated** Papers on **FRENCH TOWNS,** by EDWARD KING, L. LEJEUNE, and others.

A Series of Articles on **GERMAN POLITICAL LIFE,** by the author of "German Home Life."

A Series of Illustrated Sketches of **RAMBLES IN THE WILDS OF MEXICO AND CENTRAL AMERICA,** by Dr. FELIX L. OSWALD.

A Series of **Society Stories,** under the title of **"WOMEN'S HUSBANDS,"** by an anonymous writer.

A Series of Sketches of **VILLAGE LIFE IN THE SOUTH,** by Miss ANNIE PORTER.

Illustrated Articles descriptive of **Life and Adventures in the Caucasus,** by GEORGE KENNAN, auther of "Tent Life in Siberia;" **Wild Boars and Boar Hunting,** by Dr. G. A. SPOCKWELL; **Capri,** by DWIGHT BENTON; **English Scenery,** by HENRY JAMES, Jr., etc., etc. Contributions from the author of "The Honorable Miss Ferrard," Mrs. R. H. DAVIS, OLIVE LOGAN, JENNIE WOODVILLE, SHERWOOD BONNER (author of "Like unto Like"), MARY DEAN (author of "The Boy on a Hill Farm"), etc., etc.

Part I., in octavo book-form, of the charming serial novel,

"THROUGH WINDING WAYS,"

containing that portion of the story appearing previous to the issue of the January number, will be presented free to all new subscribers for 1879.

Extraordinary Inducements to Club-Getters.

To any person sending us a club of **FIVE New Subscribers to Lippincott's Magazine** for one year, at $4 each, will be presented a copy of

WORCESTER'S QUARTO DICTIONARY. Illustrated and Unabridged Library sheep. $10.

A PERFECT HORSE SHOE.

THE JOHN D. BILLINGS PATENT MACHINE-rolled Horse Shoe, with continuous Calk—patented 1877—is a combination of steel and iron; the body of the shoe being of solid steel, completely enveloped by a coating of tough iron; makes it elastic, tough and hard; can be bent hot or cold; this is an entirely new material for horse shoes, and the process for making it patented. This shoe prevents interfering—cures quarter crack, corn lameness, tender and contracted feet. Acknowledged by all to be *the best shoe in the world.* Will outwear two sets of the old style shoes. Trial set (4), with nails, $1; to measure place hoof on paper and draw line around with pencil. A chance is offered for reliable and energetic men to secure territory. Send for Illustrated Pamphlet. THE JOHN D. BILLINGS PATENT HORSE SHOE CO., 265 Broadway, New York.

ARMINGTON & SIMS

A. & S. were lately with THE J. C. HOADLEY COMP

Following are two of the many patented claims, which irresponsible pirates, have in these columns, denied the existence of. This patent was not a continuous press.

Dederick patent Oct. 29, 1872; Reissued July 2, 1878;

CLAIM 2. In a press for baling hay or other loose fibrous material. The oblong quadrilateral bale chamber in combination with the press box and reciprocating traverser arranged at the end of said bale chamber, whereby the bales are built up endways as set forth.

CLAIM 3. As a new article of manufacture, an oblong, quadrilateral bale of hay, straw, or other loose fibrous material, built up in successive and separate compressed sections, transversely of the bale and bound together longitudinally of the bale, substantially as described.

We hereby warn the public, and forbid the use of this form of press, or the patent bale, except in machines of our manufacture.

Copies of patents furnished gratuitously to satisfy all.

All propositions to run two Hay Presses against one of Dederick's make, will meet the prompt attention of Dederick's employees, if communicated direct, to arrange preliminaries, and all such are accepted. Advertisments with holes in to crawl out, don't amount to anything, and are made to deceive the public.

Wit and Humor

FRIVOLITIES.

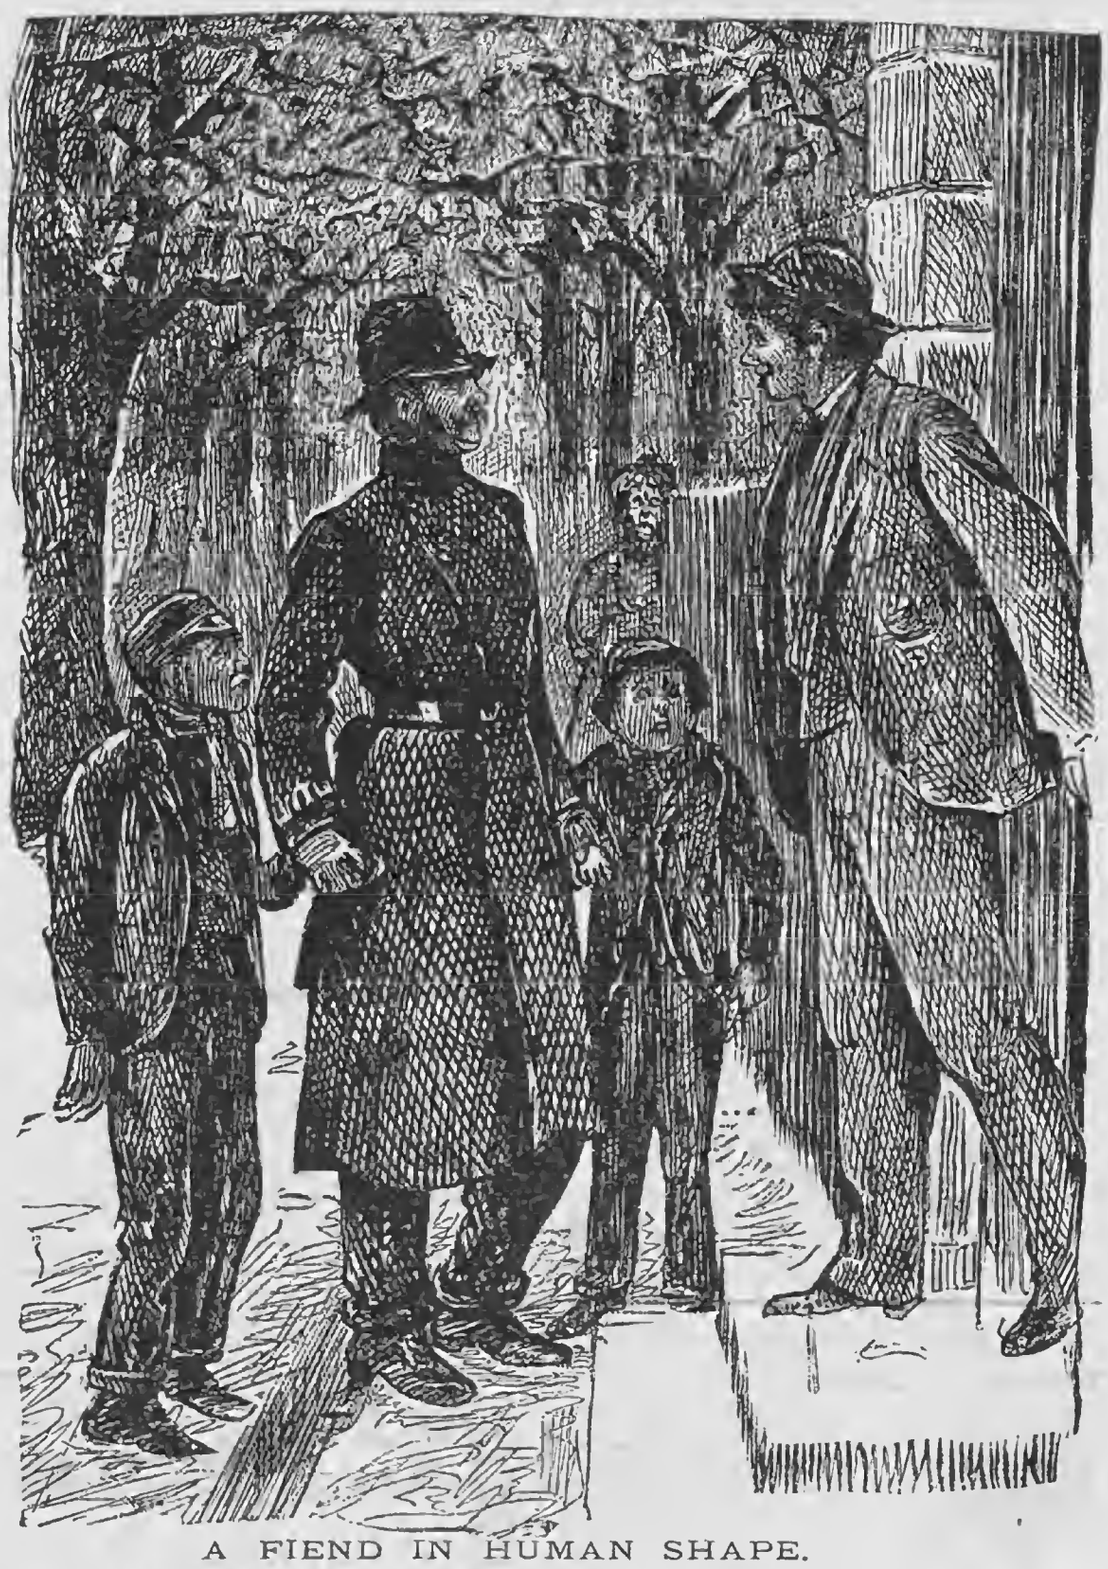
EPIGRAM, BY A POETIC LOVER.

MARIA's like a clock, they say,
Unconscious of her beauty;
She regulates the live-long day,
Exact in every duty.

If this be true, such self-command,
Such well-directed powers—
Oh! may her little *minute* hand
Become a hand of *ours*.

A MULE's head does not contain a brain capable of culture and refined rearing, but it is wonderful to what an extent the other end of him can be reared.

GRACE GREENWOOD relates, as an instance of the extravagance of New England humor, that when a young farmer's wife made her first boy's pants precisely as simple before as behind, the farmer exclaimed: "Goodness! he won't know whether he's going to school or coming home."



A FIEND IN HUMAN SHAPE.

"BEG Pardon, Sir! But I've just caught these two Young Rascals making a Slide in front of your Doorstep, and they say as *you* gave 'em permission!"

"It's quite correct. I *did*, Policeman. The fact is, I expect my Mother-in-law to luncheon."

Established 1845.

CATARRH

"THE CHECK-SPRING IS ALL THAT COULD BE DESIRED."

OFFICE OF THE AMERICAN MACHINE CO., 1924 NORTH 4TH ST., PHILA. PA. OCT. 23, 1878.

N. B. PHELPS, ESQ.—Dear Sir: It gives me much pleasure to testify to the beneficial results I have obtained from the use of the NORWEGIAN BALM. The frequent attacks of Catarrh I was subject to at every change of the weather, have almost entirely ceased, since I commenced the use of the NORWEGIAN BALM; and to-day I *consider myself quite cured*; at the same time I prefer to continue the use of the BALM, it is so cooling and soothing.

I cheerfully recommend its use to my friends and others similarly affected. The CHECK-SPRING attached to the tube of the Fountain, for regulating the flow of the Balm, is all that could be desired for the purpose for which it is intended.

Please send me another bottle of the BALM, by express, at your earliest convenience, and oblige,

Yours truly, H. ALBRECHT.

NORWEGIAN BALM

A most wonderful effect.

LAW OFFICE OF SCOTT & OESTERREICH, 55 LIBERTY ST., NEW YORK, JULY 27 1878.

N. B. PHELPS, ESQ., - My Dear Sir: I have the most sincere pleasure in acknowledging my deep obligation to you for the most signal relief I have experienced from the use of the NORWEGIAN BALM. I have suffered constantly for eight years from Catarrh, which year by year grew worse in spite of all the remedies, which during this period I have unremittingly applied.

At times my affliction has been so severe, that I have been almost entirely unfitted for mental labor, and have seriously meditated abandonment of business and removal to a milder climate.

Fortunately, four months ago I was induced to try the NORWEGIAN BALM, as I had been induced scores of times before to try other remedies by advice of friends, but I feel free to say with but little confidence in finding any essential relief.

Now Sir, I am very glad, and I feel it is due to you to say, THAT THE BALM HAS HAD A MOST WONDERFUL EFFECT. *Its beneficial effect was apparent from the start*, and to-day, I am almost free from the distressing and loath some disease.

I use the Balm daily and it is a luxury that I should be very unwilling to dispense with.

Yours, very truly, LIVINGSTON SCOTT.

Immediate relief guaranteed.
Sample Bottle Twenty-five Cents.

THE GREATEST OFFER

OF THE YEAR!!

In order to introduce our paper into every home in the U. S., we have decided to make the following *extremely liberal offer:* For the next 60 days we will receive 6 months' trial (26 issues) subscriptions to **The Weekly Cricket on the Hearth** (a mammoth 16-page, 64-column Weekly Illustrated Literary and Family Journal, size of Harper's Weekly, full of everything to delight and instruct the whole family,) **for One Dollar**, and to each subscriber we will give any one of the following beautiful and valuable presents:

No. 1.—A complete set of one-half dozen **Triple Silver-Plated Teaspoons.** These spoons are warranted heavily silver-plated, and of beautiful pattern.

No. 2.—An elegant and stylish **Photograph Album,** with gold-plated clasps, genuine morocco-bound. It is worth $1.00.

No. 3.—The beautiful and artistic steel engraving, size 22x28 inches, entitled **"Far from Home."** We guarantee this engraving to be a *genuine steel plate*, and magnificently executed.

No. 4.—An elegant **Autograph Album.** These albums are very fashionable just now, and no young lady should miss this remarkable chance to obtain it.

No. 5.—A genuine **American Russia Leather Pocket-Book.** One of the best pocket-books made.

No. 6.—A two-bladed, **Pearl-handle Pocket-Knife:** blades of best cast steel; warranted.

We *guarantee* all of the articles to be exactly as represented, and in every case you will receive *double value for your money.* THE WEEKLY CRICKET ON THE HEARTH is an old established and thoroughly reliable paper. It is *as large, and equal in every respect to any of the $4 Weeklies*, and larger and better than any of the $3 papers, and is the *cheapest paper of the kind in the world.* Our paper 6 months for $1.00, together with any one of the beautiful premiums, makes the most liberal inducement that we have ever offered. You cannot afford to miss this chance. Remember, you get 26 numbers of the paper and a splendid premium for the small sum of $1.00. *Write at once!* This rare opportunity will not be offered again. Address, THE WEEKLY CRICKET ON THE HEARTH, 215 [illegible] Jersey.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXVIII. No. 6.
WHOLE No. 1515.

NEW YORK CITY, FEB. 8, 1879.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

IF YOU DO NOT SEE YOUR PORTRAIT, ASK SOME CANDID NEIGHBOR TO POINT IT OUT.

Farm Topics.

A PANEGYRIC ON SWAMP MUCK.

GEN. W. H. NOBLE, OF BRIDGEPORT, CONN.

IT'S GOOD TO REPEAT SOME THINGS.

I HAVE often thought that a kindly review of the many thoughts of many minds in the RURAL would be of value and interest. Of course, its editor admits many notes, from whose conclusions he would dissent. He starts some ideas himself, and generously and wisely asks comment, as about the capillarity of the soil. This is right. Life in the garden and life on the farm should always be open to test new methods or prove the old. The world doesn't know half as much about animal and vegetable life as it ought. A good many old things and ways might be unlearnt, and a good many new ones taught before the fullness of wisdom comes to the tiller of the soil. But keep trying and studying by experiments in methods and results. By-and-by some farm Edison will come up to reveal unused forces, and find new workings for the old. In the meantime, let me help a little towards the intent of that well-told story about your "Poor Farm."

RICHES IN SWAMP MUCK.

The first two chapters of a Poor Farm's history in the late RURALS, delighted me. They betoken the brains whose help all poor farms sadly need. Sometimes a farm keeps poor, and gets run down, out of sloth and lack of means to better its belongings. But its poverty is about as often due to ignorance of its resources and the methods of its betterment. That muck swamp, whose sleeping forces and stored-up enrichment its historian puts into such clear figures, is the right place to begin its new life. There, are stored generations of decay, to feed the rootlets of grass or grain, courting its nourishment. The boggy hole of a swamp is but a younger branch of that deep and ancient storehouse of enrichment, the peat bed. The latter is of the same breed, but of older and larger growth. A swamp is thus a lowland water log, whose shallow depth of vegetable mold cannot be spared, and will not pay for moving to crops in other fields, though plenty for those planted above its drained surface. The peat bed is God's century-garnered store of that same mold, able to nourish not only its own, but to spare for generations, to crops on other farm-lands around its sunken area.

FARMS, FAT OR POOR, A QUESTION OF MANURE.

A farmer friend of mine, who beats all I know, in field or garden, answers to my notes of praise and wonder, "It's only a question of manure." It is a question, luck or failure, whose solution brings rich fields and abundant crops, or a starving farm. His lands are under the highest culture; they are kept so by a full supply of manure, made possible by solid cash, first laid out in stock and sea-drift-littered yards and stalls. Yet the solution is just as open to a poor farm owner's wits, as to the money of my friend. The rich owner's soil tells the footing of his funds in bank. The poor farm's swamp or peat bed, is an undug gold placer, whose water log must be drained and torn up before the glittering ore is reached. The fable of the field, made fertile by the son who trenched it deep in search for gold which his parent dimly told him would thus be found, might be paraphrased to the enrichment of a good many other sons, who have no better inheritance than a run-down, muck-swamp farm. Such may find both wealth and a solution of the manure question at the bottom of a deep swamp drain.

ACRES OF MANURE WITHIN REACH.

If there is any truth in chemistry, if the soil's elements and their record, if all we know about how plants feed and about the make-up of that black decay dug out of swamp holes, are not all myths, the owner of every swamp farm has plenty of manure at hand. In every acre of a swamp, whose drained and settled muck shows only a foot in depth of black vegetable mold, there are more than 1600 cubic yards of manurial material, equal, load for load, to that from the stalls. To be sure, you need to tame its acids and help out its dearth of salts by a sprinkling of lime and ashes. But the cost of these goes into crops on this as on other soils. They do more than this to your drained muck. They make all those 1600 cubic yards a rich, lasting and improving manure heap. Better than that; it is manure carted, spread, and commingled with the soil. You have not that toilsome job to do. You cannot exhaust its nutriment as a few crops do, in the case of a stout dressing of barn-yard manure.

A DRAINED SWAMP, A DIVIDEND BANK.

Those loads of muck are loads of crop makers that the toil and force of nature, the sun, the rains, the breezes and the upland wash and wastes, have piled up and tempered ahead for your use. You have but to yield to their stored-up forces your toil and wit, to win their powerful help. Each of those 1600 cubic yards equals in bulk a horse-cart, top-board load, well rounded up. If that yard, or load, is worth but 30 cents, you have on every acre of such land, $480 worth of enrichment,—that is a low-down figure. You could not shovel and cart and dump a load for that, except on a mighty short dray. But take off $180 for the changes and chances of the seasons; for the cost of land, of drainage and culture; for occasionally quickening and rousing its sluggishness with those salts that so rouse up vegetation in its first start. Then each acre of that swamp land, so endowed and redeemed from water log, is to you as good as, yes, far better than $300 in bank. It's a savings bank right at home; the fund therein is better than government bonds, or bank stocks or bond and mortgage. It's as solid and unfleeting as the earth. No panics or hard times or any of the perils and chances of trade, can shake its solid worth, or cut down its dividends. It's as safe as that scriptural house, founded on the solid rock.

NO DIVIDEND LESS THAN SIX PER CENT.

Year by year that $300 in such a bank, will pay to your toil and care, clear net dividends of six per cent. Besides, it will pay you for planting and reaping and housing, and for all needful enrichment. This, doubtless, reads to many besides that poor farm's owner, like romance, or some book-farmer's long-bow tale. From his boyhood he has looked out on that swamp land at his door, and thought it worthless except for the home and nesting of the blackbirds, and a few early bites of spring grass. But all I here lay down is bottom truth. Let him who can, gainsay the figures. I am far within the real footings of results from such swamp land improvement. There is no guess or fancy about it. I know whereof I speak. I have seen the right to a good deal stronger figures, proved, under no likelier chance than is before every owner of a big swamp.

I WILL TELL YOU A TALE.

A few years since, just outside the borders of this city, a practical-minded, brainful man, who studied deeper than the surface of things, bought twenty acres of miserable, heavy, forsaken swamp. A sluggish run meandered through this, as through most such lands. That he widened and deepened, as his cheapest and only drain. The rest of the area he laid out in lands, running out pretty much at right angles to the trend of this run. These lands he turnpiked, so that between each rounded surface there was a hollow, or little swale, through which the overcharge of surface moisture could rid itself into the run. This was all, except to seed it down to grass. Now, this was a work but half done. He should have dug a main drain, six feet, or seven, deep—the deeper the better. The more digging there, the less needed in other parts of the area.

AND HOW IT TURNED OUT.

Yet, in spite of all this cheap and shallow draining, he took from off that redeemed swamp, year after year, more than three tons of prime hay per acre. He had to build a big barn to store his crop. Some years it ran a great deal over three tons per acre. My friend's swamp was not the likeliest specimen of such lands. Its muck was rather shallow—a good deal under that foot-depth on which I have figured quantities. What are three tons of hay worth year by year? A farmer is a fool who sells it for less than $10 per ton. The average sales hereabouts for twenty years have been a good deal higher. I think it worth that to the farmer anywhere and at any time. Well, out of that $30, take $18 for your dividend of six per cent. on $300, and you have in hand $12 per acre to cover any kind of call for dollars, for barns, and tools, and toil, cutting and carting, and housing, taxes on land, fencing and keeping the area of meadow in good heart.

What now have you got to say, my doubting friend, about our savings bank and that $300 snugly there, for every acre of as good out-cast swamp as that whose history I have written about? But there are lots of such places everywhere, more easily saved from the weeping and gnashing of poverty, and full of enrichment for their own and other crops. There are acres upon acres of such land upon every square mile of land around me, that will pay better returns for capital outlaid, than any bank stock or old industry in the land.

YOUNG FARMER, "FIGHT IT OUT ON THIS LINE."

And yet the cry is "Go West, young man; go to the orange groves, whose delicious perfume and golden fruit will greet your five years' toil; go into stock-breeding or take some manufacturing contract; go to the gold placers or the silver mines; start a cattle ranche; go anywhere rather than stay in the rock-ribbed, swamp-farmed, chill New England." But, young farmer, think it well over before you start. I neither decry nor undervalue the enterprise which has pioneered a strip along the Atlantic into an empire spanning the continent. I know the merit and returns of bold adventure, all over this wonderful land. But let no man go away with a bee in his bonnet. Each should know that which he leaves behind in present opportunity, the toils and stores of years, and the society and make-up of old homes.

"'Tis distance lends enchantment to the view." But when you get up to the glitter and glamour, you may be as badly sold, as he who hunts the mirage on the sand, but finds not a drop to drink. You may strike oil, and you may not. A good many bore whose augers come up dry. Gold-digging averages about as hard as a Louisiana lottery as a way to get rich. The orange groves and the cattle ranches, have a good big discount on their offer of thrift and pleasant pictures, that comes in the shape of mountain fevers, swamp malaria, outlaw robbery, or the savage's swoop.

Besides, there are not a few unconsidered items of pleasant life not far off from your home, which you will not find at every step of your roaming. There is comfort in a land of settled homes and well-kept roads, and schools, and steeples; in the glimmer of a neighbor's lamp short of a day's ride. There are a thousand such-like, now unvalued things, to which you bid good-bye when you go West. But when bereft of their worth and comfort, they quickly become "to memory dear." If you are out of debt, and have health and will, you can win a new life for yourself and your land on that poor farm. Quicken your brain to study out and solve by trial this swamp question. You can do lots at the trial in the dead of winter, when labor is cheap. Plenty will jump at the chance of such work by the job. If you have not the cash, put the case before some rich neighbor; show him your studied-out plan and figures, and you can get all needful funds. Be up and doing, and before you know it, you will have rolled up to your credit in that home bank $300 for each acre you redeem.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

Straw for Horses.

WE have been feeding our horses oat straw all winter until now, when the supply is exhausted. We have a lot of barley straw on hand, but we doubt if this would be good for horses. There is a good deal of dust in it; as the barley was caught in a long rain, and this, with the beards, will, in our judgment, make it unsafe to give horses. Horses, especially those that are worked and driven, should always have forage free from dust. We reason in this way, and it is sound logic. If two rackfuls of dusty hay will set a heavy horse to blowing and panting so as to be useless, a constant diet of this sort of food will damage a sound one. It will lay the foundation for, if it does not produce, a chronic irritation of the lining membranes of the bronchial tubes and of the lungs. We have so much faith in this logic that we shall not risk the experiment. Clover hay, if dusty, is equally dangerous. Bright oat straw is the nicest kind of feed for horses. A heavy horse, when fed on it, will breathe clearly, and any horse so fed is always ready for a hard drive, as he will not then fill himself as he would on hay, and so compress the action of the lungs by crowding the diaphragm against them. Six quarts of oats a day and oat straw have kept our horses in good condition, and the stallion and big colt are fat, fed on oat straw and buckwheat bran; the former on nine quarts and the latter on twelve.

This is a cheap way to winter horses, and a most excellent way to utilize straw. An acre of ground will go farther in this way than in meadow. Poor and run-out spots in meadows may be turned over and sown with oats, and the volume of available food will not be reduced, and they may be re-seeded at the same time. Bright timothy hay is the most substantial feed for horses and, next to it, we like oat straw. Rye straw, cut short and fed with meal, is grand feed for horses, and they will do as much work on this feed as on any, but they must have plenty of meal, not less than twelve to sixteen quarts. Rye straw has a market value equal almost to hay, and hence both are costly feed, but oat straw is worth very little in market, and if it can be utilized for feed and save more costly fodder, it is a good idea. Give the horses the oat straw and let the cows have the hay. If our horses worked hard, they would require more oats.

How to Warm Hen-Houses.

Mr. Henry McCormick has his hen-house lathed and plastered, and he says it does not freeze. This, in the long run, would not be a very expensive way to fit up a hennery, as the plastered walls will be lasting and cheaper than lining with matched lumber. They would be warmer also. Our hen-house is too cold. We are satisfied of that fact, and it is the main reason why the hens do not lay more eggs in winter. They have grain enough, and bone-meal, and lime and meat, but they are too cold. We are going to line the inside with tarred paper and try that to see if it will not make the hennery warm enough. If it does not, next summer we will cover the paper with lath and plaster. The tarred paper will help to keep the lice out of the room. It only costs three cents a pound, and the expense is not much. Paper is one of the best non-conductors and therefore a very effectual lining to keep the heat in and the cold out. We are going to make it a rule to shut the entrance every night and not to open it until the cold of the night is somewhat modified by the sun—not before nine o'clock in the morning. This will help to keep the temperature more even day and night. Where there are a warm, southern exposure and a glass front, the temperature will rise quite high during the middle of the day, and in the night change to be so cold as to make an unhealthy difference. Keeping out the cold at night will help to make the temperature more uniform, and prevent roup and other disorders, the results of colds. Fowls thus kept comfortable will require less food to be kept in good condition, and will lay far more eggs.

Bad Teats.

There must be great care when cows are dried off or there will be permanent injury to the milk ducts by the accumulation of curd, which will harden and stop up the passages. The water of the milk is absorbed and so are the fatty properties (the butter); but the caseine (cheese) cannot be absorbed, and unless squeezed out of the udder and teats, remains in them and in the smaller passages and the teats, and forms into a hard mass, and often effectually stops them. Remaining in one spot all winter, the glands are often irritated and a sore is formed from which bloody milk, or rather blood, is secreted, or a callus is formed and the teat being stopped up, that portion of the udder dwindles, and is useless. A good cow is often spoiled in this way. The only safety in drying up cows is frequently to draw all of the milk out and carefully strip the teats to make certain that the last drop is forced out. This should be done every few days until no more milk can be obtained. Drying up may be hastened by feeding the cow food wanting in succulence, such as dry hay or straw.

Smoking vs. Barns.

Another man has smoked in his stable and there is one barn less. Ten cows happened to be in the yard and were saved. Everything in the barn burned.

BURNT CLAY AS A FERTILIZER.

THE stiff, yellow-clay sub-soil of our lands, full of iron ore, is poisonous to plants and vegetation. But it should be remembered that for thousands of years this same sub-soil has been the grave and repository of countless millions of reptiles, worms and insects, and that into it have been washed down the inorganic remains of myriads of both birds and beasts. How, then, can these inorganic elements be utilized so as in a cheap and effective way to permanently increase the fertility of the soil? By burning. In England I have frequently used burnt clay and always with the most beneficial effects, particularly on wheat, clover and grass; and among what I might, perhaps, style successful and scientific farmers, the practice is largely followed. The following is the method of performing the operation.

In very dry weather let a furrow be turned over as deeply as possible by a three-horse plow. Let this same furrow be again plowed up by a following three-horse plow. By these means great blocks of hard, stiff clay are thrown up, some of them nearly 100 pounds in weight. Let these lumps be collected and built in circles of, say, ten feet in diameter and several feet high. Build up the interior of each with brush, old roots, stumps, etc., so disposed as to ignite easily, and cover the whole with lumps of dry clay. After having set fire to the heap, let the mass burn for three or four days, care being taken to supply fresh clay, so as to prevent the fire from burning too furiously. By these means the stones in the clay will be completely pulverized; the silica of the soil will, to a large extent, be rendered soluble, and the carbonic acid entirely expelled from the carbonates of lime and magnesia in the rocks.

All practical farmers are aware that the lack of soluble silica is the cause why wheat and oats are apt to lie down on rich lands, and why they refuse to fill with seed the heads of grain. (?—Eds.) They also know that lime and magnesia as carbonates, do not enrich the soil, whereas when rid of the carbonic acid, they are of great value both directly as plant-food, and indirectly as means of supplying it, by decomposing and thus rendering soluble other unavailable constituents of the soil. This burnt clay is absorbent and filtrative, and has a tendency to sink into the sub-soil and amalgamate with it, causing it to work more easily and thus increasing the fertility of the soil. Heavy land can thus be cheaply and easily aerated and enriched, and a good part of the hitherto dormant chemicals contained in the great repository of Nature rendered fit for food for sustaining and stimulating vegetable life. From ten to twenty tons per acre of this burnt clay will permanently enrich the land, and farmers will find it much cheaper and more efficacious

than the commercial fertilizers that now throng our markets. (?—Eds.) H. G.
Staunton, Augusta Co, Va.

Industrial Topics.

SNOW DRIFTS.

W. I. CHAMBERLAIN.

HOW NOT TO MAKE THEM.

THE snow is beautiful, indeed, but mighty. As light as down, at first, the fleecy crystals fall. A single one, even on the delicate balances of the chemist, scarcely makes its presence felt. But gathered in countless millions by the thickening storm and swept onward by the gale, they become a force resistless. They block the path of the belated traveler. They fill the deepest railway "cuts," and bury the on-rushing trains. They crash in huge roofs by their accumulated weight.

So long as "the fleecy mantle of the earth" lies soft and still, it is poetic. But when the winds rise and "cock it up" in piles like mown hay in the meadows; when it takes bold possession of the broad highway, and drives the traveling public into the adjacent fields, then it becomes the most prosaic of facts, to be accounted for and overcome. It is in this aspect that I wish now to speak of it.

Recently in driving five miles on a southerly road, we were compelled five different times to turn out into the adjacent fields. The snow had taken complete possession of the road, by huge drifts filling it up from fence to fence—in one place for a full half mile at a single stretch. So great a hindrance to travel have the drifts been here this winter (and often before), that it has become a serious question how we shall prevent or overcome the difficulty. Here, as elsewhere, an "ounce of prevention is worth a pound of cure." I find that ounce of prevention in the *wire fence*.

Some years ago I had a lane running southeast from my barn, with a good board fence on each side of it. Our prevailing winter winds are from the southwest, and every winter that lane would drift so full of snow that it was almost impossible for cattle and horses to get through it at all. Nearly four years ago the agent for one form of wire fence offered to build one on the westerly side of the lane on these conditions: I was to test it *as long as I chose*. If then it proved effective to "turn stock" perfectly and prevent the drifting of snow in the lane, I was to pay for the labor and material. If not, not a cent; and I was to be the judge. The offer seemed to be so fair that I stripped the fence of its boards, took up each alternate post (leaving them a rod apart, which is near enough for wire fence), braced the end posts, and had wires stretched and the "barbed strips" of wood attached to the second wire from the top, and the fence was completed. It was in August, and a fine crop of "rowan" or "aftermath" grew temptingly in the meadow just over the wire fence. I yarded my whole dairy in the lane for several nights to give the thing a thorough test. The fence was too much for the cows. They wanted the nice grass, pricked their necks a few times on the barbed strips while reaching after it, and then quit the business in disgust. An unruly horse came up to it, didn't notice the top wire, but saw the barbed wooden strip a foot below it, and seemed to say to himself, "Pooh! do they call *that* a fence," reared and threw his front feet easily over the strip, and thought he was in the meadow. He was soon disabused of the idea. The top wire he didn't see, threw his legs down on the barbed strip which gave them a good pricking. The old fellow retreated a rod or so, came up in good order for a second attack, and—retreated as before. This time he tipped his head to one side, pricked up his ears in a comical way, and looked at the fence, as if he said, "Beaten at last, as sure as I live! A plague on this telegraph business, any way!" And he has not learned telegraphing yet!

Winter came, and the first storm of snow and wind said to itself, "Now I'll fill up that lane for the cows!" But not a drift could find harbor behind the wires any more than in the open field. At the end of a year I paid for the fence, and have since put up more than half a mile more. One strip of it keeps my neighbor's forty cows out of my grain fields and orchard, and another keeps my own dairy out of valuable crops. The cows and horses have not learned to jump it or break it down, or the snow to lodge and drift behind it.

This is not a puff or an advertisement of wire fences. I am not an agent, and have not the slightest pecuniary interest in their introduction. There are some objections to them, especially to the kind that uses a twisted, jagged, barbed wire instead of the wooden strip. But they have advantages. They are far cheaper than board fences, and seem to be durable and effective. But the point I urge here is that *snow cannot lodge and drift behind them*. Hedges, stone walls, rail fences and board fences, all harbor huge drifts. Time after time this winter, as I have turned into the fields to avoid such drifts that blocked the highway, I have said to myself, "A wire fence here would have prevented all this." And I have even questioned whether a law could not be justified, requiring owners of land bordering on the road in exposed localities subject to heavy drifting, to build there such fences as will not harbor snow drifts, or else keep the road shoveled clear. The fences that do the mischief in Ohio, with our westerly winds, are those on the west side of roads leading in a northerly and southerly direction.
Summit Co., Ohio.

REQUEST.—Will any of our friends who have tried the Billings' patent horse-shoe tell us just what they think of it?

Industrial Societies.

WESTERN NEW YORK HORTICULTURAL SOCIETY.

Paris-green and sheep versus the codling-moth; culture and manure for the Pear, Peach and Quince; paper bands against the c. m.; trimming trees; Pears free from blight; sod for bearing orchards, culture for young orchards, manure for old; drainage for all orchards, sandy soil for Apples, clayey for Pears; objection to cultivation of orchards; Apples set 20 feet apart in the largest orchard in the world: no fear of too much fruit; a couple of exceptions; disagreement; warm soil for early and heavy soil for late Apples; everlasting cider; cider jelly; small fruit packages and the kind of fruit for them; marketing fruit abroad; extra-quality fruit; keeping fruit; destruction of insect pests; good new Peaches and Grapes; cider pomace; yellows; a selection of Plums.

THE twenty-fourth annual meeting of this Society was held at Rochester on the 22d January, President Barry presiding. H. T. Jones read a brief report upon Ornithology and was followed by the reports of the County Committees on visiting Orchards.

Mr. Woodward, of Niagara Co., told us the receipts from fruits in his county were as much as from any other crop, and those who cared for their orchards received remunerative returns. For the Apple he preferred clean culture—grass was conducive to the apple-tree borer. Their successful fruit growers all practiced clean culture. The codling-moth was doing great damage, but his ravages were greatly checked by the use of the different moth traps—as many as 36,000 having been caught in one season by one party. He had tried bands, but preferred letting sheep run in the orchard. They were better than swine. In one instance Paris-green had been applied to destroy the canker-worm, quite early in the season, just after the fruit had formed. The trees thus treated bore fruit perfectly sound; whereas the rest of the orchard was badly infested with the codling-moth. The Peach required cultivation and responded liberally to generous treatment, barnyard manure being the best fertilizer for it. Pears could be grown without cultivation, but those orchards which were well manured gave the largest crops and the finest fruit. He recommended the use of ashes, salt, bone meal and lime. For Quinces he would add a little barnyard manure.

C. M. Hooker, of Monroe Co., to secure the best results thought the main thing was to keep the trees well cultivated till 25 years old and feed them well. He advocated the use of paper bands for destroying the codling-moth. The patent bands were no better than the paper, and cost more. It was his experience that a second band, near the branches, paid as well as the first. He had always had plenty of wormy apples, although he had used the bands constantly. In many instances much damage was done by trimming—which is generally done too irregularly and unmethodically to be of much value. He formed the head seven feet high and trimmed a little every year. We never hear but one side—the bright one—of fruit growing. Failures are seldom recorded. It takes longer for an apple orchard to come into profitable bearing than is generally supposed. He would look for profits after 20 years rather than before; and many orchards, for various reasons, would never pay.

W. Brown Smith, of Onondaga Co., said the apple crop was unusually large. The Quince crop, too, was large and the fruit very nice. Pears were the poorest crop of any—the cause being the blight. Some varieties were comparatively exempt—among them the Seckel, Tyson, Beurre D'Anjou, Duchesse, Winter Nelis, Josephine De Malines and Duchesse De Bordeaux, and he would recommend the planting of these sorts in districts afflicted with the pest. Godfrey Zimmerman, of Erie Co., thought younger trees might need cultivation, but for bearing orchards a sod was preferable, but the trees needed manure.

J. J. Thomas, of Cayuga Co., said that although their county had a soil well adapted for the Apple—they had no large orchards, and farmers generally complained this year because they had so many apples. Only those who had in previous years established a trade made money from their large crops. In every case cultivation or manure has been rewarded by fine fruit. He would recommend that young orchards be cultivated and old ones cropped short or manured. The Amsden June and Alexander, both large, handsome peaches, had ripened with him July 20th. Prof. W. R. Lazenby, of Tompkins Co., said the apple product was not a staple one with them. Some orchards were very productive, but in many cases there was a lack of thorough drainage—which should be the foundation of every orchard. Apples preferred a sandy soil, while Pears do well on heavy clay. He recommended the use of decomposed stable manure, refuse salt, lime and ashes. He would prune yearly if necessary, and never remove a limb larger than one inch in diameter. In his section he would plant the trees not more than 25 feet apart each way, and not allow them to grow more than 18 feet high. H. T. Brooks, of Wyoming Co., would advise not to plow orchards, although many of our best growers cultivate as much as they do corn. Salt gives stability to products and he would advise its use. The President then read an interesting letter he had received from R. McKinstry, of Hudson, N. Y. He planted his apples 20 feet apart each way, thinking the limbs would not interlace seriously before reaching the age of 25 years. He is satisfied with his course, and is confident the extra trees will amply repay for themselves before he is obliged to move them.

Questions for discussion were then presented, the first being, "Over-production: Are we in danger from an over-production of fruit, and how can we secure a steady supply?" S. D. Willard opened the discussion, advancing the theory that consumption increases more rapidly than production, and we need have no fears of overstocking the market. New markets were being constantly opened to us; insect enemies are increasing rapidly, and till we supply the whole world, we may increase our production and rely upon finding a good market. Mr. Younglove, of Vine Valley, would answer to the first part of the question, "No—except it may be of Apples and Strawberries—but of the Grape and Peach—*never*." The demand for grapes is increasing rapidly. People are becoming educated to the every-day use of fruit, and they buy it. Would answer the second part of the question by advising the selection of favorable localities along our lakes, where there is a reasonable certainty of a crop every year. "Plant orchards even if the locality is seemingly unfavorable. One crop of peaches will pay for all care and expense. It is so of other fruits. They will often succeed where success is not looked for."

Mr. Barry: "Fruit growing is not yet reduced to a system. It is mainly carried on by those who sell their surplus fruit at such prices as they may be able to get. I believe that fruit growing in Western New York will never be overdone—we have a favorable climate and good land, but our whole soil is not favorable for orchards. Any good dry soil is suitable for Apples, but sand is not so durable as clay and requires more manure."

Mr. Lay found that on his warm sunny soil the early Apples succeed the best; whereas the late winter varieties were more perfect when grown on heavy soil. Mr. Hooker stated that the history of almost any fruit-growing is that we have grown too much. It is no use to accumulate large crops unless we can find better markets. Reduce the area under fruit and take better care of what is left.

Mr. Woodward thought it would be impossible to over-supply our markets with prime fruit, but very easy to overstock it with second-quality fruit. The export of fruit this year was ten times our last year's exportations. The only way to produce a steady supply is to manure and cultivate our orchards better than we do.

"How can we enlarge and supply a home market for fruit?" was next discussed. Prof. Lazenby advocated the use of smaller packages for apples, as it would be more convenient for a portion of the consumers. Mr. Woodward spoke of a method of preparing cider, by passing it through sand, so that it would keep perfectly sweet any length of time. Mr. Thomas mentioned the successful experiment of evaporating cider to a jelly-like consistency. Mr. Hooker valued the home market more than the foreign. The beauty of our fruit sells it. If we add quality to this, the demand will increase. Make the grade even, both in beauty and quality. Mr. Green thought that beauty was more important than quality in securing the sale of fruit.

"Foreign market: Can we expect a large foreign demand for fresh and dried fruit, and how can we increase the demand?" formed the first topic for discussion at the evening session. Mr. Root thought that all that is necessary is to ship the fruit in an attractive form. Mr. Ellwanger instanced the high prices obtained in Paris for apples, and stated that neither that nor the German market was supplied. Mr. Hooker thought it would be a great advantage if we could establish direct communication with the European markets. Mr. Green said the Baldwin is a favorite in Europe. Mr. Woodward thought that honest packing was necessary. Mr. Hoag told of a gentleman who had shipped apples to Russia and obtained seven dollars per bbl. Mr. Beadle told of an American gentleman who had established a good trade in Scotland. He had done it by dealing honestly with his customers. Prof. Lazenby stated that in Michigan the Northern Spy was their best apple for exportation. Mr. Barry had successfully shipped apples to Europe, wrapping each one in paper and packing them in barrels.

"Extra quality of fruit: To what extent can the production of fruit of an extra quality be profitably carried?" was next considered.

Mr. Woodward said that the best only paid, especially in peaches and pears. He advised the practice of thinning. Mr. Younglove thought it was not so much the thinning as the time of thinning. Peaches should be at least five or six inches apart.

"Fruit packages: What description of fruit packages, etc., have been found most satisfactory, especially for small fruit, peaches and grapes?" was next discussed. Mr. Hubbard had found baskets holding six, twelve and eighteen quarts, very satisfactory: besides, they were very cheap. Mr. Younglove thought if market baskets holding about a bushel each and strongly made could be procured, they would be in demand. Mr. Hooker stated that Canadians put up apples in larger barrels than ours, and get a better price in consequence.

"Keeping fruit: Is there any new experience of value in regard to drying and canning fruits, and in the construction of refrigerator fruit houses and cars, or new method of keeping fruit?" was then debated.

Mr. Hoag spoke of the establishments recently put up near him as experiments, but which are working successfully.

"Insects: What progress has been made in preventing the ravages of insects, especially the codling-moth, the borers, and which of the several kinds of traps in use, have been found most effective?"

Prof. Lazenby said the codling-moth laid about 200 eggs in the course of the season, showing the necessity of destroying as many as we could. He did not believe it would do to rely upon medicated bands. He said the bands should be applied about the time the Wilson Albany Strawberry blooms, and should be frequently examined during the summer. Mr. Woodward spoke of the utility of hogs in an orchard for destroying the canker-worm, and sheep for destroying the codling-moth. Mr. Fish would be cautious in turning sheep into the orchard. Mr. Chapin thought the birds were our cheapest insect destroyers. Mr. Woodward advised washing the bodies of the trees with whale oil soap, to prevent sheep gnawing the bark. Mr. Hoag indorsed Mr. Chapin's views. He had bands last summer almost entirely destroyed by birds searching for the worms. Mr. Chapin destroyed the canker-worm by applying tar to his trees and sprinkling Paris-green on it. Mr. Zimmerman said there was a beetle that destroyed the chrysalis of the codling-moth. Mr. Beadle thought a soft soap preparation applied to apple trees in the spring, would keep the borers out. Prof. Lazenby knew of two orchards in which this preparation had been used with success. They used the soft soap undiluted. Mr. Harris thought, from his experience, it was unsafe to use ashes as a preventive for the borer.

New Peaches; Are any of the new early varieties of peaches worthy of being extensively planted for market?

Mr. Younglove would recommend the Alexander and Amsden June for near market. Mr. Hooker thinks it is premature to recommend any of the new varieties for extensive planting; Mr. Younglove likes the Salway for a very late peach. Mr. Woodward would be careful about recommending the Salway for general cultivation. It does well in only a few favored localties. Mr. Barry noted that the many new varieties brought out during the past year were mainly of Hale's Early parentage, and enumerated some 30 new varieties of Peaches brought out last year.

Mr. Green spoke highly of the Forest Rose Strawberry, Glendale, Captain Jack, Cumberland Triumph, Sharpless and Duchesse and recommended high culture if satisfactory results were desired.

"What has been the experience the past year with the new varieties of Grapes?" was the next subject handled. Mr. Prentiss gave a brief account of the Prentiss Grape which he has had in bearing for 14 years. It is a seedling of the Isabella; about as early as the Concord; a strong grower and very productive; foliage healthy; rather inclined to overbear; a good keeper and commands a high price in market. Specimens exhibited showed a handsome bunch of excellent keeping qualities and fair flavor. Mr. Farley described the Duchesse as a very promising sort from the Hudson River. He had fruited it two years at Union Springs; vine the most vigorous of any he grew out of 50 varieties. The form of clus-

ter resembles the Delaware but both berry and cluster are larger. Admirable for shipping. Mr. Salter thought highly of the Pocklington. It is hardy, early, productive, a strong grower and of fair quality. Mr. Hoag being requested by several, gave a short history of his new Grape, the Niagara. It ripens with the Hartford and hangs on the vine fully two weeks after ripening. An excellent shipper. Mr. Younglove, Mr. Hooker and others spoke in high terms of this new Grape.

The grapes above described are all white or green, and are all competitors for popular favor. None of them is yet for sale, but they are being carefully tested.

In the evening of the 23d inst., the question-box was opened and the following questions asked: "Has cider pomace any value as a manure?" Prof. Dann quoted from Prof. Storer that its manurial value was very slight. Mr. Barry would not throw it away. It is not injurious and might be beneficial.

"What about the Yellows?" Mr. Rogers thinks it is caused by the grub in the roots. Mr. Hooker, to prevent any misunderstanding as to the disease, gave the symptoms, which are: first year, slender, yellowish shoots appear to be forced out of the larger branches. This is followed by premature ripening of the fruit and deterioration of its quality. The second year, these symptoms appear to be aggravated, and perhaps there is no fruit at all, followed by the possible death of the tree. No hope for a tree once diseased—better dig it out and burn it. Some localities that were formerly seriously affected with this disease, are now entirely free from it. He is afraid its visitation here will prove a serious thing. Mr. Hooker reported that they had been troubled with it in Chautauqua County for several years, but it was now spreading very rapidly over the whole county. Mr. Woodward said that in Niagara County the yellow shoots do not appear at first and sometimes one-half of the tree will be diseased while the other half is apparently healthy, but the second year generally takes the other half too. They had never been troubled with the yellows till after the winter of 1877, and many whose trees were apparently diseased had restored them to their former vigor by the liberal use of barnyard manure. Mr. Fowler said that the yellows was accompanied with low vitality. By proper care and manure he thinks we can keep it out. Mr. Younglove stated that the cause of the death of the tree was the grub. The yellows are always first seen in the fruit. He would remove the tree and have some hesitation in replanting in the same spot. Mr. Hooker said that the disease sometimes commences on one branch. We should not regard peach culture as a hopeless case, because the yellows have disappeared in some localities. Mr. Allen had restored his trees by the use of barnyard manure. Mr. Ruhlman stated that a Dr. Gould had applied iron chips around his affected trees and with good success. Mr. Barry said that all these symptoms are common in sickly trees. Many trees have this appearance, which do not have the yellows.

Mr. Barry was requested to name the six best Plums for market culture. His choice was: Reine Claude de Bavay, Lombard, Pond's Seedling, Fellenberg, Bradshaw, Coe's Golden Drop, Magnum Bonum, Shropshire Damson. He did not like to stop at the half dozen. Mr. Hoag named the Mooney as a valuable market sort. Mr. Hooker would add the Monroe Gage; Mr. Jones, the German Prune.

Upon some reference being made to the Russian Apples, Mr. Barry stated that he did not know of one as good as our own, but they were hardy and especially adapted to the Northwest.

H. T. J.

VERMONT DAIRYMEN'S ASSOCIATION.

THE winter meeting of this active Society, which was held at Montpelier, Jan. 22, 23 and 24, was, as usual, well attended, spirited, and every way successful. Papers on a great variety of subjects were read, and addresses made on various topics by intelligent gentlemen. These were followed by lively discussions. The most prominent speakers from abroad were Professors Atwater of Connecticut, and Englehardt of Syracuse, Mr. Whittaker of Massachusetts, and Capt. Strongitharm of England. Among our home speakers was ex-Gov. Smith, who, besides being president of the Vermont Central Railroad, is one of our most extensive farmers, and who gave a very vivid and interesting sketch of his recent trip through England, Ireland, Belgium, France and Switzerland, in each of which countries he took pains to inform himself by personal inspection of the actual condition of agriculture, and especially of the dairy interest. His report of his visit to the Cork (Ireland) butter market, and his comparison of it with the almost equally noted butter market of his own town, St. Albans, excited a lively interest among his hearers. Mr. Skinner, of Tunbridge, and Mr. Whitney, of Williston, two of our "boss" butter makers, (dairymen who have got far beyond that once imagined *Ultima Thule* of 300 pounds to the cow), gave full and detailed accounts of their methods of management and manufacture. The last-named gentleman, who began dairying twenty odd years ago with a herd that yielded 50 pounds of butter per cow, has, by careful selection and breeding, with little use of foreign blood, probably come the nearest of any man to creating a native breed of dairy cows. Prof. Englehardt discoursed upon the sugar-beet and beet sugar making. Prof. Atwater gave one of his clear, masterly lectures on feeding materials, with special reference to the feeding of dairy herds. Capt. Strongitharm read a paper upon the feeding value of the palm-nut meal. Mr. Whittaker discoursed with ability upon the general subject of dairy-feeding, and the management of herds with reference to continuous milk production. The subject of the recent International Dairy Fair, and Vermont's position there, formed very interesting topics of discussion, and it was resolved with enthusiasm that the officers of this Association should accept the offer of a position in the management of the International, with authority to contribute financial aid, and with instructions to secure a full representation of Vermont in every line of dairy production at the next international exhibition. It came out in discussion that, notwithstanding the inroads of Western creamery butter upon the market for our medium grades of product, for strictly fine and fancy butter Vermont still holds her grip on the Boston market, the only difficulty being the lack of enough of this class of goods to answer the rapidly growing market for a kind of butter not heretofore demanded in large quantities.

T. H. HOSKINS, M. D.

Orleans Co., Vt.

The Herdsman.

STOCK NOTES.

KEEPING BACK HOGS.—In view of the extremely low price of hogs during the present season, a price lower in some parts of the West than has been obtained for them at any time within the last thirty years, it would probably be more profitable to hold back young and thrifty animals than to sell them now at a loss, which in many places must be done if they are disposed of at the ruling figures. The present depression in the trade cannot last. The financial stringency which now depresses all branches of trade, can only be temporary. The last report from the Treasury at Washington shows an accumulation in that department of $233,000,000 in coin, almost the whole of which must go into circulation within the next twelve months. In the banks of England and France a very unusually large amount of coin and bullion has also accumulated—a sure sign of an exceptionally bad state of trade in our foreign markets. During last year the excess in value of our exports over our imports was in the neighborhood of $280,000,000, a gain of that amount by this country, and it is estimated that during the present year the gain will amount to $300,000,000. Since New Year's about $150,000,000 have been invested here in Government bonds at four per cent. interest, mainly by banks and capitalists, and the greater part of this sum will certainly be withdrawn and put into undertakings which will return a larger percentage, so soon as financial confidence revives, and this must soon occur now that the business of the country has returned to a specie basis. The tightness in money matters caused by this measure has been especially hard upon farmers, but it is the part of wisdom to pluck consolation even from disaster, and hope at any rate can be drawn from this step. Moreover, the present distress among the working classes in Great Britain, who in good times are among the best customers for our hog products, cannot last long, and with an easier money market and an increase of purchasers, prices must go up. Then again, many farmers will probably be discouraged by the present prices of hogs and quit the business of raising them, and the consequent smaller supply next year will contribute with the larger demand and the greater amount of money in circulation to raise the prices for them a twelvemonth hence.

We have here mentioned our chief reasons for the suggestion that hog products will probably "pay" better next winter than they are doing this, in order to enable our readers to form an intelligent opinion on the matter for themselves. Of course, the risks of loss from disease in the meantime, as well as the comparative value of the extra feed and the profits therefrom, together with the worth of money in hand, are all questions which every farmer is in the best position to decide for his own neighborhood and his own circumstances.

WINTER SHELTER FOR SHEEP.—The advantages of shelter for all kinds of stock during the inclemency of winter have been so frequently and forcibly set forth in these pages and in all other periodicals and works in which the best agricultural experience has been given to the public, that to dwell on the subject here would be as wearisome as to dilate upon the evils of cracks in barns. There are some people, however, who, while they are careful to provide protection from the weather for their cattle, their horses and even for their hogs, seem to imagine that Nature has done this office for their sheep. Because they themselves might to a considerable extent be insensible to the miseries of cutting blasts, of heavy showers, and of melting snows, if protected by the sheep's warm fleece in addition to their usual covering and while kept warm by moving about, these wiseacres act on the supposition that the same defence must be equally effective for its owner. They forget that an unusual protection is in every case needed against an unusual hardship, whereas the unsheltered sheep has only its ordinary coat to screen it from severe weather, however extraordinary it may be. Moreover, the covering that would be warm enough for man or beast while in motion, would be a sorry protection for either while asleep or at rest. Then again, neither the cold nor the wet that penetrated the fleece in which they might be cosily enfolded, would come into direct contact with the sensitive nerves that ramify all through the skin, and by reflex action from the little brains even such folks must have, would produce a local feeling of discomfort and misery, while the same causes would instantly produce these sensations in the poor sheep.

Here at the East almost every sheep owner affords his flock some winter shelter, but out West this is often neglected, not through such stupidity as that here indicated, but from carelessness, oversight or on account of the examples set by neighbors; for examples of this kind are often more infectious than diptheria. For the sake of economy in feed, of the health of the poor things, and of gentle humanity, we would urge upon any of our readers who may have hitherto neglected to provide some sort of shelter for his fleecy flock, to delay not an hour longer before he supplies the omission. Even a rough shed to shield them from the pelting rain, the heavy snow or the cutting blast, would be a godsend to the pitiful things during this inclement season.

HOGS.—Following is the total number of hogs packed in the West during the winter season, with average cost of hogs per 100 pounds, dressed and gross, according to Cincinnati "Price Current" reports:

Seasons.	Number packed.	Cost, net.	Cost, gross
1877–78	6,505,446	$4 99	$3 99
1876–77	5,101,308	7 18	5 74
1875–76	4,880,135	8 82	7 05
1874–75	5,568,226	8 33	6 66
1873–74	5,466,200	5 33	4 34
1872–73	5,410,314	4 66	3 73
1871–72	4,831,558	5 15	4 12
1870–71	3,695,251	6 58	5 26
1869–70	2,635,312	11 53	9 23
1868–69	2,490,573	10 22	8 18
1867–68	2,781,684	7 95	6 36
1866–67	2,490,791	7 22	5 78
1865–66	1,785,955	11 67	9 34
1864–65	2,422,779	14 32	11 46
1863–64	3,961,166	6 70	5 36
1862–63	4,029,529	4 20	3 36
1861–62	2,802,666	3 03	2 42
1860–61	2,156,702	5 67	4 57
1859–60	2,950,822	5 91	4 73
1858–59	2,465,552	6 28	5 02
1857–58	2,210,778	5 86	3 89
1856–57	1,818,468	5 94	4 75
1855–56	2,488,502	5 75	4 60
1854–55	3,124,404	4 21	3 37
1853–54	2,434,770	4 19	3 35
1852–53	2,201,110	6 01	4 81
1851–52	1,182,846	4 45	3 56
1850–51	1,232,867	3 75	3 00
1849–50	1,652,220	2 66	2 13

Of these the following numbers were packed in the towns mentioned during the last 25 years:

Seasons.	Chicago	Cin'ti.	St. L.	Milw.	L'ville.	Ind's.
1878	2,501,215	632,302	509,540	371,982	279,414	270,150
1877	1,618,084	523,576	414,747	225,598	214,862	294,198
1876	1,592,065	563,359	329,895	181,972	223,147	323,184
1875	1,690,348	560,184	462,245	295,566	273,118	278,339
1874	1,520,024	481,253	463,746	294,054	295,967	295,769
1873	1,425,079	626,505	538,000	340,500	302,244	196,317
1872	1,218,858	650,501	419,032	315,000	320,512	172,100
1871	919,087	500,046	306,500	241,000	248,135	105,000
1870	688,140	337,320	241,316	172,525	185,000	65,474
1869	597,964	356,756	224,341	129,094	187,598	56,466
1868	796,226	304,931	237,323	150,463	140,880	52,645
1867	639,332	462,810	176,830	136,370	157,071	53,739
1866	507,355	354,079	116,760	87,853	90,519	36,000
1865	760, 14	350,600	155,894	107,130	92,469	55,838
1864	904,639	370,223	240,000	141,601	100,367	66,400
1863	970,264	605,457	175,000	182,465	115,000	77,000
1862	505,691	474,467	84,096	94,761	91,330	43,100
1861	271,805	433,792	70,800	51,000	136,764	28,781
1860	151,332	434,429	70,326	52,000	251,270	32,276
1859	171,684	393,826	57,500	52,000	288,500	33,214
1808	99,262	446,677	98,000	16,000	253,393	40,480
1857	74,000	344,512	71,531	15,000	245,830	27,160
1856	80,380	405,396	93,000	34,000	332,733	65,030
1855	73,694	355,786	89,830	34,000	283,788	34,476
1854	52,849	421,000	90,000	43,000	407,033	44,900

HINTS FROM ASSEMBLED WISDOM.—At the fifth annual meeting of the Iowa Fine-Stock Breeders' Ass'n, lately held at Des Moines, abortion in cattle and horses was attributed to overexertion, fright, use of the spurs in mares, foul food, moldy fodder, soured roots and ergotized grain. As preventives, food should be changed frequently and the above causes avoided. To prevent contagious abortion, affected animals should be quarantined. The Cotswold was honored with the title of the Short-horn among sheep, on account of its rapid growth, superior quality, tendency to fatten at any age and long wool. Grass was enthroned on the seat from which King Cotton was years ago deposed. Hogs, it was held, would be more healthy and profitable if they got more of it than they now do. For roadsters, a trotting sire was preferred to a thoroughbred, and farmers were advised to shun breeding fast horses and confine themselves to draft-horses. The great advantages of beef cattle that can be fatted for the butcher at an early age, were strongly dwelt upon. So were those of creameries over butter making at home. As a remedy for warts on calves, a salve was recommended, made of sulphur, lard and camphor; and to get rid of lice on cattle, two methods were given: first, an application of two drachms of arsenic in a quart of water; and, second, thoroughly washing, and applying eight parts of good linseed oil, one part of tar, and sulphur sufficient to make a thin paste.

JOTTINGS.—The recent rise in hog products seems to be of a speculative nature, as it is generally conceded that the supply is greater than the demand. The "bulls" who tossed up the prices will probably be badly injured by the "bears" who have already pulled them down. . . . The sale of Hereford cattle appears to be rapidly growing in the West, especially on the plains where milk is of little or no account. Hereford breeders claim that for beef their breed matures at least as early as the Short-horn, takes on flesh as readily, and brings top prices oftener in the London market. . . . Mainly on account of some articles in American papers, asserting the existence of pleuro-pneumonia among our cattle in some isolated parts of the country, the English papers have for some time been making strong efforts to secure from the Privy Council an order compelling the slaughter, at the port of debarkation, of animals imported from the United States. On the 28th of January news was telegraped to this point that on account of the arrival from Canada of a cargo of cattle, some of which had died on the passage from that much-dreaded disease, the Privy Council had yielded to the pressure put upon it and forbidden the removal from the port of debarkation of cattle shipped from this side of the Atlantic. This measure would lower the price of imported beeves about $25 per head, and as the shippers would be sure to deduct at least that amount from the prices given here, our stockmen and farmers would be so much out of pocket. The news came from Montreal and it is thought that it was merely a trick of Canadians, to secure the bulk of the trade for the next year. Although shippers here are in daily expectation of such an order, no direct news of its issue has hitherto reached this port. . . . Fat Scotch cattle bring in the English markets $25 per head more than American cattle of the same weight, the difference being due solely to their superior quality. Here is a profit for the improvement of our stock by more careful breeding. . . . Three or four weeks ago, it was mentioned in our "news" department that an English buyer of horses for Egypt declared that Great Britain could not compete with America in the price of horses for his market, and now we find that the American, Gen. Stone, for a long time an officer in the Khedive's army, has written to Commissioner Le Duc that there is a fine opening for the sale of our prime horses in the land of the Pharoahs. . . . All live-stock designed for exportation are carefully inspected by Government order to prevent all possible danger of spreading any contagious disorder elsewhere. . . . That British Empire Horse Association whose formation was mentioned some months ago in the RURAL, is about to wind-up its affairs, leaving others to realize its high expectations of profits from the importation of horses from this country.

The export demand for cattle in Canada next spring is put down by the American Stockman at eight thousand fat beeves a week, and it is considered probable that the shipments from this country will be at least as heavy. In the latter estimate no account is taken of our live-stock trade with Cuba and a few of the other West Indian Islands which are supplied mainly from Texas and Florida. . . . We notice in our Western exchanges, and in telegrams to New York papers from that quarter, that there has been considerable mortality among sheep in some parts of those States and especially on the plains, owing to lack of food and shelter. . . . There is a pretty lively discussion between the National Live-Stock Journal and the Turf, Field and Farm about the value of thoroughbred blood in the trotter. The former, while acknowledging that the modern rattler originally derived much of his good qualities from that source, thinks that where prime roadsters are wanted, the best cross now is that with a good trotting sire. It declares that our trotters have been so vastly improved of late that it would be as hopeless to expect further advancement from thoroughbred blood in their case, as it would be to think that an increase of speed could nowadays be secured by the cross of an English race-horse and an Arab. Our New York contemporary, on the other hand, is of the opinion that there still remains a good deal of trotting virtue in a thoroughbred cross, and for the last few weeks has been citing a number of exceptionally fast examples of young flyers, the progeny of such breeding.

LARGE HOGS.—A correspondent from Augusta, Kalamazoo County, Mich., writes us that this fall he sold two hogs, 20 months old,

that weighed, alive, 1,250 pounds, and dressed, 1,100 pounds. They were a cross of Chester White and Byfield.

Miscellaneous.

PEARL MILLET.

EDS. RURAL NEW-YORKER,—*Dear Sirs:* In your notice of our Catalogue—for which by the way accept my thanks—you seem to think I made a mistake when I stated that Pearl Millet grew with us to an average hight of 9 feet in 45 days. No, Sirs, I can assure you that no mistake or exaggeration was made, either in dates, hight, or weight. In fact I was so astonished at the result, that in every case I had the weights and hights carefully tested by my foreman for corroboration; and I can further assure you that in every instance we give, they were under, rather than over the results stated. But as I said in my article, it was garden culture, and it would not be reasonable to expect such yields from the average farm culture.

I have just been talking with a gentleman who has most successfully practiced the ensilage method with green-corn stalks, and he is now preparing to grow Pearl Millet next season for this purpose, and thinks with the extraordinary growth of the Millet, and the economic advantages of ensilage, that even a "little farm well tilled," may prove a gold mine to dairy farmers in the vicinity of large cities. PETER HENDERSON.

New York, Jan. 30, 1879.

POSSIBLE DISASTER FROM IMPROVED FARMING.—Good butter, prime meat, No. 1 wheat, and, in fact, all good things are scarce and costly. The farmer who bends all his energies to produce such crops, grows rich fast. Therefore *all* farmers should at once abandon their slovenly, slipshod modes of doing business, note well-tested methods of doing better, and "go and do likewise." But suppose everybody does do so; suppose everything grown or produced is of the very highest and finest quality possible, will prices keep up? No, indeed! they would come down to the price of rancid butter. Then, what 's the use of trying to do better, if it is only to bring ruin upon the whole community!! Fortunately there are not many who are trying, it being one of those questions not yet perfectly settled in the farmer's mind, whether any effort to get above the common herd is worth the trouble. From present appearances, the "dreadful consequences" may be looked at calmly; there is no danger of such a condition of things culminating in our time, so we may all possess our souls in patience. S. R. M.

WHAT OTHERS SAY.

MYSTERIOUS PROVIDENCES.—Mr. W. I. Chamberlain, in a thoughtful article to the New York Tribune, shows that we are over-ready to ascribe to the dispensations of a Mysterious Providence what is really due to our own laziness or ignorance. He says: "Some years ago a fellow-townsman died of low typhoid fever. Both of his sons sickened of the same disease. One died, the other 'recovered,' shattered for life in mind and body. At the funeral the minister made such remarks as one would expect from the text: 'How unsearchable are His judgments, and His ways past finding out.' But in this case were the judgments unsearchable, and the ways concealed? As the minister stood in the open doorway of the house, there was wafted to him a stench, almost intolerable to untrained nostrils, from the pig-pen not a hundred feet distant, where a dozen huge hogs were fed thrice daily with sour whey, and from the barnyard nearer still on the other side, where thirty cows were milked night and morning, trampiug their voidings deep into the muddy ground. Midway between yard and pen was the house well, and the copious summer rains had doubtless soaked typhoid germs from both through the level, porous ground into this well, to be drank daily by the unthinking victims. And day and night the malaria from the same sources unstrung their physical systems, and made them susceptible to the poison. And yet the doctor had never pointed out these things, or advised their removal."

After giving several forcible facts which have come under his own observation he concludes:

"But why multiply examples, as I might do from personal knowledge and from books and medical reviews? They give almost countless well authenticated and thoroughly tested instances where disease-germs have been filtered through the soil from privies, pig-pens, cow-yards, grave-yards, buried excrements or washed bedding of typhoid patients, and from defective sewers or drain-pipes and the like, sometimes long distances, into wells and springs, and have given slow poison to individuals, families, neighborhoods and even whole villages, while bad air has increased the evils of bad water. Such facts ought to be known and heeded. Such milking-yards and pig-pens as those described ought to exist nowhere, or at worst never near enough to house and well to taint air and water. Cheese factories, too, with scores of hogs fed near by, or whey run into the nearest brook, are often breeders of ague and typhoid fever. Their offensive features should be abated, by law if necessary. In villages, the slop-drains and privies often create nuisances and destroy health and life. In the village referred to above, the instances cited, and other similar ones, finally forced the council to pass and enforce stringent sanitary ordinances.

"The doctors in any community have a duty to perform; and if, through ignorance, self-interest or false delicacy, they fail to perform it, why shall not the ministers undertake it? They can do it in the line of their profession. For if our bodies are to be "fit temples for the indwelling of the Holy Spirit," they certainly demand physical care on moral grounds. As for "Mysterious Providences," God does oftimes "move in a mysterious way," no doubt, but far more often according to fixed natural laws not hard to be understood by those who will study. In such cases what right have we to talk of mystery? What right have we to think we are "receiving the chastisements of the Lord in meekness," when we are simply taking the physical consequences of our own negligence or filth? What right have we to submit to what we can surmount or remove? That is laziness, not piety; and ministers will do valiant service by telling us so. With tremendous power can they teach from instances like those I have given that "whatsoever a man soweth that shall he also reap." And few incitements to right living are more powerful than this law if really believed."

FARMERS AND POLITICIANS.—*Editor Rural:*—I like your caricatures, and I like the idea of publishing them. Nothing has a greater influence with the public than pictorial wit. It takes hold of men that argument cannot reach. It strikes hard, and to a vital spot, and is feared by the wrong-doers more than all other methods of attacking wrong. Nast's pencil broke up the Tweed Ring—pity that pencil has been employed so ill since. Nast, the satirist of crime in high places, was a great moral force: Nast as a mere partisan, is a melancholy object.

The farmers need the aid of the pictorial satirist, and are just the men to appreciate and applaud his work when done for their behoof. We have had plenty of flattery from the politicians, while the same politicians were making laws to hurt the farmers. So have come upon us high taxes, the result of extravagant legislation; and unequal taxes, by means of which an unjust share of the public burdens is put upon farming property. These wrongs cry loudly for redress. Add to this, exorbitant usury (ten per cent. and sometimes more, on the perfect security of improved farms), and any one may see that the only thing that has kept tens of thousands of farmers from bankruptcy has been a succession of favorable seasons that we all know cannot long continue. If the RURAL will strike for the farmers as a farmers' paper should, with pen and pencil, you may soon reckon your subscribers by the hundred thousand. The field stands unoccupied before you. T. H. H.

MUSHROOM CULTURE.—"We saw a crop last Saturday," says the London Gardeners' Chronicle, "that well merited the application of the term 'wonderful,' in Mr. Maitland's garden at Merton Abbey, Surrey, and which, without exception, is the best example of mushroom cultivation that has come under our notice. The Mushroom-house is 155 feet long, and 12 feet wide, and contains five beds, four for mushrooms and one for sea-kale, and each of the entire length of the shed. There is a path down the center, about 30 inches wide, and the beds are arranged two on one side, three on the other, and all averaging about one foot in depth. The practice followed is to fill up the beds with ordinary 'London manure' beaten firmly down, and then left until the heat is on the wane before spawning. When this is done the beds are covered with hay for a week to 'draw the spawn;' at the end of that time, or as soon as it is seen that the spawn is freely on the move, about half an inch of soil is lightly placed over the beds and merely leveled down. For a week or two after soiling the temperature of the house is maintained at about 60°, and subsequently at about 53° or 54°. In this way the mushrooms begin to appear in about thirty days, and in about five weeks the beds are in full bearing, as at present, and producing the delicious "buttons," 'cups," and "grillers," in perfectly astounding quantities. In ordinary practice it takes six weeks to get a crop, and then not often a big one.

WHY DOES MAIZE YIELD TWICE AS MUCH AS WHEAT?—Referring to a discussion upon this topic in the American Cultivator, Professor Beal says: "The two crops are not treated with equal fairness. The wheat is usually sown (when it yields fifteen bushels to the acre) and allowed to struggle with weeds and a baked soil, while the Indian corn, if we consider workings in both directions, is cultivated from four to six times during its early growth.

Give wheat good cultivation after the plants come up, and we all know by numerous experiments that the yield is very greatly increased. Perhaps Mr. Harris has never seen the experiment tried of planting Indian corn and then allowing it to fight its own way with grass and weeds, with no hoeing by hand or horse. In Michigan we have some enterprising (?) men, who have tried this valuable experiment on corn, whether by design or shiftlessness it does not matter. The result on the maize was amazing, and far from gratifying. I have not seen the crops measured, but I am certain in some cases there could not have been fifteen bushels of shelled corn to the acre."

NIGHT SOIL.—If the privy were treated more like an earth-closet, and a barrel of dry sifted coal ashes kept convenient for covering the excrement as fast as deposited, the health of the family and the fertility of the soil would be greatly improved. Night soil thus treated is handled with as much facility and as little offense to the olfactory nerves, as is a pile of rich barnyard manure.—ALEX. HYDE, in the New England Homestead.

TALKS ON TIMELY TOPICS.

FUNDING DEBTS.—The Government of this country is rapidly paying off debts contracted by it when it was glad to be able to borrow money nominally at six per cent. interest, but as it had to take the loan in depreciated greenbacks and has now to pay it in gold, the interest on the amount actually obtained, was in reality far more extortionate than the greediest money lender would have the face to ask even of a farmer. To pay off these old debts whose exorbitant interest has for years been a grievous burden on the industry of the country, the Government is contracting new debts on which it has to pay only four per cent. interest. We hear of several farmers, also, who are preparing to imitate this wise economy. To get rid of old debts, the interest of 10 or 12 per cent. on which has been gradually reducing them to poverty, each of them is now on the outlook for an opportunity to incur new obligations at a much lower percentage, with the proceeds of which he intends to clear off his outstanding liabilities together with their heavy yearly burden. In the near future capital must be content with more modest profits than in the days of inflation; these men will accordingly be able to borrow money at lower rates of interest, and after they have by this means paid their old debts, though the sum of their indebtedness may be as great in the future as in the past, their yearly tax on account of it will be much lighter, and therefore more easily bearable.

LOW PRICES AND HIGH EXPENSES ON ENGLISH FARMS.—For at least twenty years, the London Live-Stock Journal says, farmers there have seen nothing like the hard times that are now upon them. Within a year, while high-class cheese has held its own, inferior kinds have sunk at least $5 per cwt.; butter is from 12c. to 15c. per pound lower; fat pigs are scarcely salable; wool is about half the price it was five years ago; and wheat from 24c. to 36c. less than this time last year. Then look at the burdens which English farmers have to bear, and from most of which ours are free. At a recent agricultural meeting in Essex, one of the farmers, who rented 210 acres, of which 195 acres only were productive, gave the following abstract of his expenditure during the year, outside of his rent, all farm and family expenses and government taxes: Tithe paid to lay proprietor of the local church "living," $512; ditto to vicar, $148; poor rate, $201; sanitary rate, $57.50; surveyor's rate, $35.25; school rate, $20; voluntary church rate, $10.25, or a total of $985.

CATALOGUES, &c., RECEIVED.

B. K. BLISS & SONS' ILLUSTRATED HAND-BOOK FOR THE FARM AND GARDEN AND CATALOGUE OF GARDEN, FIELD AND FLOWER SEEDS, 34 Barclay Street, New York. So-called novelties are offered in abundance every year, as being decided improvements upon older varieties of their kinds. And yet those who purchase them find out to their cost that they are too often inferior to the old sorts, and that not one in twenty is really worth the high price asked. This firm has, we think, been fortunate in the selection of new things to offer to the public, as the popularity of many which they have introduced from season to season, through many years, may prove. Among potatoes, the Early Rose, Snowflake, Alpha, Peerless and others are widely known and cultivated. The Acme, by many deemed the best of all our tomatoes; also the Conqueror and Golden Trophy; and latterly the much-talked-of Defiance and Champlain spring wheats, have been popularized, so to speak, by their enterprise. All of our last year's readers will recall our own experiments with Defiance and Champlain spring wheats. Of six different varieties planted, Defiance produced the heaviest straw, the largest heads and the greatest number of grains to the head. Hot weather and frequent showers, as we supposed, caused the grain to shrink so that the yield was very light. But we have never been able to raise Spring Wheat profitably, and it is not to be supposed that either Defiance or Champlain will succeed where other spring varieties persistently fail. A month ago we were obliged to pay $15.00 per bushel for seed of Defiance for our free seed distribution. Mr. Bliss informs us, however, that his supply is now greater than he supposed it would be at that time, for which reason the retail price has been fixed at $15.00 per bushel. Mr. Bliss also offers our Beauty of Hebron Potato at 60 cts. per lb. He is fair enough to admit that "it is a fine cropper of excellent quality, ripens with the Early Rose, and is equally valuable as a market variety."

His American Wonder Pea was tested at the Rural Grounds last summer and reported upon. We can assure our readers that it is of excellent quality (as good as the Little Gem), of dwarf habit, vigorous and productive. The only *Wonder* to us is that Mr. Bliss should be satisfied to present a picture of an English variety as its portrait. Among other new peas we see Culverwell's Telegraph and Carter's Telephone, the first of which we tested last season with results which did not commend the variety as worthy of special notice.

Among a long list of seeds of special plants, we see the Climbing Asparagus offered. It differs from ordinary Asparagus only in its vine's manner of growth. This catalogue of 136 pages is one of the most neatly executed and serviceable to the farmer, gardener or florist, published in this country.

THIRD REPORT of the Montreal Horticultural Society and Fruit-growers' Association of the Province of Quebec, for the year 1877. This handsome compilation contains an unusually large fund of useful information on many branches of the horticultural art, and is especially rich in information valuable to fruit-growers and to the cultivators of flowers. A very important point in the teachings of such works lies in the fact that they are not the gleanings of book-makers, merely compiling what others have said on each topic, but the honest lessons taught by the experience of those who have won a well-earned reputation for efficiency in the practical treatment of the plants about which they speak. For instance, in this work may be found an article by Dr. T. H. Hoskins on Apple Culture in the Cold North, and another by Mrs. Annie L. Jack on Currant Culture, and our readers know that any information either of these gives on the subjects mentioned, is the outcome of actual experience, and therefore of no small practical value. The pamphlet contains 22 other reports on various topics of interest and importance to horticulturists, equally the results of the experience of other persons whose names, however, are not so pleasantly familiar to our readers. The manner in which the work is edited reflects credit on the Secretary of the Society, Henry S. Evans.

JAS. J. H. GREGORY, Marblehead, Mass. An excellent catalogue, free to those of our readers who will apply. Among the seeds of the more notable plants offered, we see the early Amber Sugar Cane, which is now exciting a deal of interest in various sections; White Russian Spring Wheat, which, our readers may remember, is one of the varieties which we tested at the Rural Farm last spring. As compared with the others it did not take a high rank;—Teosinte (Reana luxurians), for a description and cut of which we refer to the RURAL of Nov. 2, may prove of value as a fodder plant south of Pennsylvania;—American Wonder Pea, which, according to our tests, is one of the best second early peas in cultivation;—Egyptian Sweet Corn, and an endless list of squashes, melons, beans, tomatoes, etc. The engravings are exceptionally good and the entire catalogue one of the best.

E. & J. C. WILLIAMS. Descriptive Catalogue of trees, plants, vines, etc. Montclair, N. J. There are some nursery establishments that it gives us pleasure to refer to, because we know our friends ordering of them will be faithfully served. The above is one of them. The Messrs. Williams make a specialty of small fruits; are the introducers of the well-known Kittatinny Blackberry; are nurserymen of great experience, and may be trusted to do just whatever may justly be expected of them. The pamphlet is free.

DEPARTMENT OF AGRICULTURE, Special Report No. 9. This Report, of 28 pages, is of more than usual utility and interest. In it are enumerated the different varieties of wheat, corn, cotton, oats, barley, buckwheat, potatoes, Irish and sweet; hay, sorghum, tobacco and fruit, chiefly cultivated in each State during the past season, together with a pithy statement of the success that attended each sort.

BARR & SUGDEN, 12 King Street, Covent Garden, London, W. C. Descriptive Spring Catalogue of choice Seeds for the flower and kitchen garden. This establishment is well known as being one of the most enterprising and trustworthy in England.

Dairy Husbandry.

DAIRYING IN 1878.

THERE can be no disguising the fact that the season of 1878 has been a hard one for the dairy interest of the country. The prices of butter and cheese have been extremely low, and wherever milk has been sold, the price of that has corresponded with those of its products. As a result dairymen are generally discouraged. With most of them, besides loss from low prices, there has been an additional loss in the value of their stock. For those who bought on credit last spring, in hopes of paying from the season's profits the outlook is as bad as it well could be.

Dismissing this feature of the case, let us see if there are not some compensating advantages in low prices for those who make the business a permanent one.

First: the decline in prices of stock for those who are not in debt or do not care to sell, can scarcely be called a loss. It makes no difference to the productive capacity of ten cows whether we sell them at twenty-five, or one hundred dollars each. In the latter case, the owner is apt to spend money more freely on personal expenses, live higher and finally come to grief. If he calls his cows worth only twenty-five dollars each, he does not expect to make so much, and so manages to come out all right. Calling our property worth more than it is, has been the ruin of many a business man these last few years.

Second: with cheaper cows we are getting down to bottom prices in the cost of production. This is greatly enlarging the market for our dairy products. American cheese is going abroad more extensively than ever before. We undersell English cheese-makers in their own markets. Our own people are learning to use cheese more than ever before. When once they begin to use it they will not soon discontinue it. But for the extremely low price of meats, cheese would be used still more than it is. The difficulty in getting a good market for cheese has been that the great mass of farmers through the country who do not make cheese, manage to do without it. Hereafter it is almost certain that dairy products will be higher; but so far as cheese is concerned, this will not induce farmers to engage in its production. It requires too many and too expensive appliances, and altogether more skill than any can afford except they make dairying a regular business. Yet wherever the liking for cheese has been learned, there will be a sure and steady demand even at considerably higher prices than now prevail. Whoever then can manage to rub along this year, may confidently hope to do better in the near future.

Monroe, Co., N. Y. W. J. FOWLER.

The Poultry Yard.

HOW MANY EGGS CAN A HEN LAY?

THERE is little doubt but that away back before the arrival of historical times, the hen had been domesticated, and supplied the rude, scantily clad tribes of those days with eggs and toothsome morsels. Since then few animals have been so closely connected with domestic life, or have afforded both by their numbers and their intimate relationship to man, so many opportunities of ascertaining everything of interest concerning themselves, and yet, strange to say, considerable doubt still rests upon the number of eggs any breed of them is capable of laying under any particular kind of treatment. In order to arouse a legitimate interest on the subject with a view to settle the question on a basis of ascertained facts, we gave in the RURAL of Dec. 21, a statement by a practical poultry keeper of the number of eggs from different breeds of fowls. Again, in our issue of Jan. 11, we quoted from the work of Prof. Miles a statement of Geyelin, given with the assurance characteristic of a full-fledged scientist, to the effect that no hen can lay more than 600 eggs, and the learned man condescended even to specify the proportion in which these would be dropped in each of eleven years. In giving this statement, we ventured to doubt its complete accuracy, despite the scientific reputations of its author and indorser, because, among other reasons, a generalization on the matter could not be correct on account of the fact that some breeds of poultry are vastly more prolific than others.

Our correspondent, Mr. Nelson Ritter, is also bold enough to differ in opinion from such eminent authorities, but then he modestly gives a pretty good reason for his dissent. He says: "While I dislike to disagree with the scientists who are supposed to know whereof they affirm, yet I cannot accept the conclusions of Geyelin regarding how many eggs a hen can lay, as stated in RURAL of Jan. 11th. I have at this moment hens not seven months old, that have laid twice the number of eggs he allows for the first year, and am confident they will continue to lay for several months to come. Were I convinced of the truth of Geyelin's statement, I should certainly 'drop' the hen business and that immediately. I have found the greatest profit in keeping hens only until they were eighteen months to two years old."

Isn't it about time that in this age of investigation, congressional, ecclesiastical, practical and scientific, some lover of truth and research should set himself the task of finding out by careful experiment through a number of years how many eggs a hen is actually capable of laying. To a regular poultry keeper of a systematic and inquiring turn of mind, there would be little extra labor or trouble in keeping a careful account of all the particulars necessary to give value to the investigation.

Everywhere.

RURAL SPECIAL REPORTS.

MISSISSIPPI, Okolona, Chickasaw Co., Jan. 21st.—We have had a severe winter hitherto and no work has yet been done towards next year's crops. Usually we have a considerable amount of plowing done by this time. Our people declare they will plant less cotton than usual the present year and more of the necessaries of life; but, judging from the fate of similar resolutions in the past, I fear that when seeding time comes they will forget or disregard this decision, and neglect everything else in the interest of cotton. Our forage crops were very short last year, and we shall be short of forage for making the next crops. Cotton did not nearly pay the expense of production. As for myself, I have not raised any cotton on my farm for the last three years, and was in hopes that my neighbors would follow my example; and, indeed, I think they would have done so were it not for the unjust discrimination against us made by railroads in the matter of freight. We are only 260 miles from Mobile; St. Louis is 650 miles from it, yet St. Louis ships freight to Mobile for $10 less per car-load than we can from this point—$10 more for transporting the same amount of freight for but a trifle over one-third of the distance! The railroad may possibly find that such an injustice may put a few dollars more in its treasury; but some of us begin to doubt whether the privileges granted the road were bestowed on it in order to enable it to gain an unjust profit at the expense of those living along its route, by whose votes those privileges were conceded on the plea that its construction would be a special benefit to them. It seems to me that those interested in the agriculture of the country could in some honest way force a change in this dishonest system. The farmers of the country are the chief sufferers by it: but then to rouse farmers to united effort against corporate injustice and oppression, requires ten times the provocation that would band together in vigorous action any other class in the community. A. M.

CALIFORNIA, Santa Rosa, Sonoma Co., Jan. 20.—Since May 1, 1878, our rainfall has been 5. 70-100 inches; at this time last year it was 14. 95-100 inches. We may expect more rain up to April 1, and occasional showers, perhaps, in April. Our wheat on summer fallow is looking well. The ground was cross-plowed and seeded before the rains. The deep and mellow soil retains moisture enough to keep the plants growing. But fields of wheat adjoining, not summer-fallowed, look badly for want of rain. Ours, however, is a notable exception, and we attribute its better plight to the heavy coat of stable manure received a year ago last summer. During the months of Dec. and Jan. so far, the days have been clear and pleasant—temperature, at noon, about 55°. But the nights were invariably cool, with frequent heavy white frosts. Newly plowed ground will be found at sunrise with a frozen crust nearly strong enough to walk over. Plantations of young Eucalyptus trees have suffered, and the tender growing branches of exposed Oranges were nipped. But their matured leaves and hardened wood stand cold that freezes them as stiff as sheet-iron, unless the thermometer falls below 18°. Ours are not injured; but they are somewhat protected by branches of Cypress. The mode of doing this is to drive, close to the tree, a high stake from the top of which depends evergreen limbs of any kind, which mingle with the branches and shelter the tree from the direct rays of the sun when the leaves thaw out. After the tree is six or seven years old, if is hardy here. Any evergreen shelter is better than straw, or mats, or other covering. We never lost a tree protected in this way, while extensive young plantations covered with sacks, have been destroyed. SPECS.

MISSOURI, Kingston Furnace, Washington County, Jan. 24.—The winter of 1877-8 was of "ethereal mildness"—result, a splendid crop of peaches and no crop of ice. The first part of the season of 1878-9 bid fair to follow in the same footsteps, but changed its mind, and we have had it ranging from 10 to 20 degrees below zero—result, such an ice crop that ex-Gov. Fletcher said at Washington, that when he left home the population of Missouri was engaged in two principal pursuits—gathering ice and running for the U. S. Senate. Another result, by no means so pleasant, is a total loss of our peach crop for the coming season. However, the trees did so well last season that they needed "a rest." The winter wheat has come out from under the snow looking No. 1, but now comes the danger of successive freezing and thawing in which the drilled wheat stands a better chance than the broadcast. An acre of red, rust-proof winter oats, sown Aug. 17th last (an experiment here in farming) went under the snow in first-rate condition, and have come out from under it in like good order, but I do not consider them out of the woods yet by any means. In a RURAL article on alfalfa, it is said that it loves the sun. With this I agree, but it does well in Germany, where, I think, the cold is as intense as in New Hampshire. I propose this season to try the German plan of "soiling" hogs upon it. Here nearly all who work farming in summer, mine for lead ore in winter, and just now are busy harvesting their winter crop. N. W. B.

MINN., Lakeside, Riverville Co., Jan. 28.—Grasshoppers and blight played sad havoc the past year with our crops in this portion of the country. The wheat crop was badly blighted and graded mostly No. 4, worth at the present time, 33c. per bushel; average yield, about 12 bushels per acre. Corn was a full crop, 40 bushels per acre; price per bushel, 20c. Oats yielded 50 bushels per acre, and its price is the same as that of corn. Potatoes were a light crop owing to the ravages of the potato beetles; price, 20c. to 25c. per bushel. Pork is worth $2 50 to $3 per 100 lbs.; beef, ditto; butter, 16c. per pound; eggs, 12½c. per dozen. We have had a remarkably fine winter so far. Only about an inch of snow has fallen. Wheeling is superb. The first week in January was remarkably cold, the thermometer on the 2d registering 26° below zero. The sun has not been behind a cloud for nearly a month. Not a day has been lost down to the present time by teamsters or out-door laborers.

M. T. R.

OHIO, Willersburg, Jan. 27, 1879.—We have had very good sleighing the past four weeks until lately. Within the last two days it has thawed considerably, and the jingle of sleigh-bells has ceased. The weather has been very cold. The thermometer was the lowest on the morning of Jan. 3d, being 23° below zero. Apples, potatoes and other vegetables were frozen in large quantities in almost every cellar I know of. It was also very severe on game, especially quail. They were found in bunches of eight or ten frozen stiff. Times are dull, and produce low. Wheat, 88c. to 90c. per bushel; flour, $4.50 to $5.50 per bbl.; rye, 40c. per bushel; corn, 30c.; oats, 20c.; barley, 50c.; timothy seed, $1.25; clover seed, $3.60; lard, 9c.; butter, 12c.; eggs, 20c.; apples, 30c. to 40c. per bushel; potatoes, 60c. to 65c.; live pork, $2.25 to $2.50 per hundred; beef cattle, $3.00 to $3.25. Feed is plenty and stock is looking exceedingly well, notwithstanding the cold weather. G. W. D.

NEW YORK, Ithaca, Jan. 24.—Strong winds and heavy snow; many cross-roads badly drifted; hard times for farmers, particularly for those in debt. Beef, dressed, 4c. to 6c. per pound; pork, $3 50 per cwt.; hay, $4 to $7 per ton; buckwheat, 40c. per bushel; wheat, 95c.; oats, 24c.; corn, 45c; potatoes, 60 to 70c.: apples, 25c. to 35c.; butter, 14c. to 17c., per pound; eggs, 20c. per doz. Clover seed is turning out very poor, a large amount of hay is being shipped.

NEW YORK, Ithaca, Jan, 28.—This is a regular spring day, clear and warm; the snow is disappearing very fast. The State Grange of New York is in session here and has a very full attendance. L. M.

IOWA, Manchester, Delaware Co., Jan. 26.—Last year I raised the Acme tomato and found it the finest tomato I have ever raised and I have had the Trophy for many years. A. D.

The Querist.

ANSWERS TO CORRESPONDENTS.

Potato Culture, Etc.

L. W. R., Chenango. N. Y., asks 1, the best way to get the largest quantity of potatoes from a pound of seed; 2, whether it would be safe, the coming season, to plant potatoes on the same piece of ground on which the potatoes planted there last year, were very much injured by angle and wire-worms; 3, what is the best way of using hard-wood ashes, as a fertilizer for potatoes; 4, how are potatoes raised under straw; 5, will peanuts bought raw at the stands, grow.

ANS.—A pound of potatoes will go a good ways in planting, if each eye is cut by itself with as much of the potato as there can be. If the piece is not larger than a pea, the eye will sprout and form a hill. The butt or stem end may be cut into small pieces, and many of them will sprout even if no eyes are visible, just as buds will come out of limbs of trees where they are not discernible. With ordinary culture, when the seed is prepared in this way, several hundred-fold of potatoes may be grown. A large crop can be raised by planting the potatoes in a hot-bed and allowing them to sprout, and then removing the sprout and planting it in ground carefully prepared, and letting the potatoes throw out another from the same eye, which, in its turn, is likewise transplanted, and so on, until the vitality of the eye is exhausted. A number of settings, or hills, may be obtained from all of the eyes in this way, and the yield from each eye very largely multiplied. This is the way the great yields are obtained. To be successful, the conditions of soil, temperature and moisture must be just right, that is, in a condition to promote rapid and vigorous growth. Any one familiar with the manipulation of hot-beds could, doubtless, succeed in the sprouting method; but if the grower is not thus familiar, it would be best to cut the potatoes in small pieces and plant each piece, with the eye, in a hill in the open ground. The richer the ground is made, the larger will be the growth; but such overgrown tubers are more apt to rot. We would not recommend making the ground too rich, as healthy potatoes are the best for the table or for seed.

2. We do not think angle-worms ever injure crops, as they extract their food from the ground. Wire-worms prey upon the roots of plants, and might injure the potatoes by eating off the roots to the vines, or by feeding upon the potatoes themselves. Grubs are the most damaging to potatoes, as they eat holes into them. It does not follow that either will damage a crop the second year because they did the year before, as the same conditions may not exist; and then again, the winter may be such as to make a decided change. From these facts there may be no risk in planting the same ground successively with the same crop, and we should prefer to plant potatoes on potato ground rather than on sod or stubble, where, if the season is favorable for the growth and development of worms and grubs, they would be sure to be found the most active. The grubs last year were not caused in such large numbers by the potatoes, or by any crop, but by the favorable conditions which must have existed for a space of time long enough to bring them into existence, and, in the absence of grass roots or other vegetation, they fed upon the potatoes. A mild winter is conducive to the development of all sorts of worms and grubs, and one of opposite character is destructive to them.

3. Unleached ashes should be sown broadcast and harrowed in, but leached ashes, not being so strong in alkali, may be used to the best advantage by dropping a handful in the hill. They may be dropped on the ground and the potato put on top, or the potato dropped first and the ashes put on top of it. It is immaterial. The ground will absorb enough of the potash in unleached ashes so that the potato will not be injured by it, and the ashes will retain moisture so that the potato will come up sooner. Potatoes exhaust the soil of potash, and on this account a dressing of it in the form of wood ashes, is most valuable, and will materially increase the yield. With an occasional dressing of ashes, a patch of ground may be devoted to the culture of potatoes for years with excellent returns. It is one of the few crops where a direct application of manure containing its chemical constituents, has a direct and perfect effect. This is owing to the simple organism of the plant. Quite a poor soil contains starch enough to supply the demands for successive crops of potatoes, if potash is not wanting.

4. The culture of potatoes under straw is a simple matter. The seed should be placed on the *surface* of the ground, at short distances apart, say 16 inches, and then carefully covered with straw. If the ground is comparatively free from weeds, the straw need not be more than six inches thick; but if the land is very foul, the covering of the straw should be at least a foot deep. Rye straw, if it has been bound up, will lie closer, more solid, to the ground and need not be so thick. The light must be excluded from the potato, and it will grow and take root in the ground. There must be straw enough to produce darkness, and this is all that is required. The straw does not turn to mold during the season, but packs down and affords a complete protection, so that the hills of young potatoes form on the top of the ground with nothing over them but the mulch made by the straw. Of course, there is no cultivating or hoeing, but if weeds make their appearance above the straw they must *pulled out*.

5. Peanuts, as they are found in market, not too old, will grow. After they are scorched or baked, they will not grow.

Preparing Muck for Use; Alfalfa.

A Subscriber—address mislaid—asks, 1, whether muck, dug out now, would be in a fit condition to apply to root and other crops in spring, and what is the best way of preparing it in the shortest time; 2, how much clover seed should

be sown per acre with wheat in the spring; 3, whether alfalfa can supply the place of clover.

(1) Muck is totally inert until it is decomposed, and it decomposes slowly while it is saturated with water. It is in the best condition for use when it is a year old. Muck that is dug now can hardly be made ready for use in the spring, unless it comes out loose and soft, so that it can be worked up easily: when in that condition it may be mixed with wood-ashes and thrown into heaps where it will heat and ferment. Otherwise it may be mixed in equal proportions with stable manure and thrown in compact heaps to ferment until required for use. There is usually considerable acid in fresh swamp muck, which renders it injurious rather than beneficial; this is neutralized by mixture with lime, wood-ashes or potash salts. It would be best to keep the muck above referred to in heaps until next fall and then to use it largely, when dry and fine, as bedding for cattle, pigs and poultry; in fact in every place where it can be made serviceable in that way; and then to throw it into compact heaps, that it may not freeze, but will decay and become soluble through the winter months.

(2) If the clover is sown alone, 12 pounds per acre would be a proper quantity. (3) By no means. Alfalfa can never become a substitute for clover in ordinary agriculture where clover succeeds well. It is an excellent crop to use in place of clover where the climate is too dry for the latter. Where heavy manuring can be given, alfalfa may be made useful as a soiling crop to come after clover and to be cut two or three times in the season, but it will not succeed for this purpose excepting upon rich soil. (4) Yes.

Hen Manure and Ashes.

T. L. M., Hartford, Trumbull Co., Ohio, asks: 1. whether it would be safe to mix hen manure and wood-ashes now and let them lie until spring; 2, what is the best method of applying the manure to corn in the hill.

ANS.—No; mixing ashes and hen manure now and letting the mixture lie for two or three months, would certainly cause the loss of the greater part of the ammonia in the manure. The poultry droppings should be stored away safely in barrels or elsewhere, covered with earth or, better still, with dry muck, until just before it is wanted for use. It should then be reduced to a powder and mixed with, say, three times its own bulk of mold or dry muck, so that it can be more easily spread and to lessen the risk of its burning the seed. Dry ashes may be added just before its application, so that they will not act upon the manure before it is buried.

2. In applying the manure to corn in hills, a thin layer of earth should be left between the manure and the seed, to prevent injury to the latter. If a planter is not used, drop the corn by hand in the hills, cover it with half an inch or so of earth, then drop a small handful of the mixture, scatter it a few inches about and cover it with a little more earth. Or a handful of manure may be thrown down where the hill is to be, and quickly mixed with the earth by two or three strokes of the hoe, and the corn dropped and buried the usual way. If care is taken to always allow a layer of earth between the manure and the seed, the labor of mixing loam or muck with the manure before applying it, can be dispensed with. This information has been given at greater length more than twice in different articles during the year. A thoroughly live paper dislikes repetition, but courtesy to our long list of new readers must stand our excuse in this and several other cases.

The Rose-Bug Puzzle.

A. B., Syracuse, N. Y., says: "I wish to get some information about Rose Bugs. Have a vineyard of three acres, planted 8x8 feet, and eight to twelve years planted, mainly Concord. No rot whatever and no mildew on the Concord. Most of the time since my first crop, in 1869, they have given good, well-matured crops of grapes, yielding five tons in 1877. Three years ago a few Rose Bugs made their appearance here for the first time as far as we know. They did very little damage the first season, but they came again the next season, 1877, in much greater numbers, and last season, 1878, they came in such immense numbers as to destroy my grape crop completely. Now, what I wish to learn is this: Is the Rose Bug likely to be a permanent institution where they once make their appearance—like rats and mice, do they come to stay? I have studied the habits of this pest in various books and papers, but cannot learn from any of them what I most wish to know. Are they likely to show themselves in large numbers many years in succession in the same place? If so, I must rip out my grape vines, as there seems to be no method of destroying or driving away this pest, without costing more than the value of the crop. My vineyard is on sandy land, and from what I can learn, the bugs are not troublesome on heavy clay soil, being generally found on sandy or gravelly lands."

ANS.—During some seasons we are overrun with Rose Bugs—then, again, we see little of them for several years. We would recommend our friend to plant near the vines a hedge of plants which they prefer to the Grape, such as Roses, Spiræas, etc.

Price of Oil-cake.

O. F. B. Rushford, Alleghany Co., N. Y., says that while oil-cake is quoted in a late RURAL at $28 per ton, the best figure at which he can get it at Buffalo, is at the rate of $38 per ton for Western cake, and he asks the cause of so wide a margin, and whether there is any difference in quality between Western and Eastern cake.

ANS.—We do not know how to account for the extreme difference in prices otherwise than on the ground that New York quotations are based upon 50-ton lots for export, which are to-day quoted at $27.25, while our friend probably buys unimportant quantities at retail. There is no material difference in the quality of Western cake from that ground East. Whenever considerable quantities of the cake are used, it would be well for the purchaser to correspond directly with some Western or Eastern mill instead of buying it near home. A number of farmers who use the article in the same neighborhood, could, with little trouble, combine their purchases, and thus be enabled to secure what they want at better figures than if each bought the comparatively small quantity he might need.

Sowing Orchard-Grass—Barbed Wire-Fence.

W. H. B. Lincoln, Loudoun Co., Va., asks: 1. What is the best time to sow orchard-grass and ought it to be harrowed in; 2, how to kill the sand thistle which he describes; 3, can barbed wire-fence be recommended by those who have used it.

ANS.—1. The best time to sow orchard-grass is early in the spring. It should be sown upon the harrowed soil and then covered lightly by means of a brush harrow. The seed is very light and should not be covered deeply. 2. To kill the weed mentioned (which cannot be referred to by name without a specimen by which it can be identified), the best plan would probably be to improve the soil by manuring and cultivation, when the crop's growth would soon smother it out. 3. The barbed wire-fence may turn out to be as dangerous to the owner as for a trespasser, and it is a question if it is wise to use a fence by which a neighbor's cattle may be injured and a claim for damages arise. It is as durable as any other wire fence and no more. See the article on snow-drifts elsewhere in this issue.

Field Peas for Vermont.

S. C. So. Vernon, Vt., asks what kind of peas should be used as a field crop thereabouts: should they be sown with oats; broadcasted or drilled?

ANS.—The Common Canada Field Peas (now quoted in market at 90c.@$1.00 per bushel) are the best for field sowing. They should be broadcasted, at the rate of three pecks of peas and two bushels of oats to the acre. The two are easily separated in the fanning mill after thrashing. Ten bushels of hard-wood ashes and a barrel of good ammoniated superphosphate form a fair dressing for an acre on reversed sod, and are better than stable manure which makes the peas run too much to vine. The ground should be thoroughly harrowed both before and after sowing, and finished by rolling. When phosphate is not at hand, 20 bushels of ashes and one bushel of salt make a good dressing.

Spinning-Flax.

S. K. P. Chesterfield, Conn., asks where flax prepared ready for spinning, can be bought, and its price.

ANS.—Though there are in this country a number of places, especially in Ohio, where flax is water-retted, and dew-retted, dried, broken, scutched and hatcheled and thus made fit for spinning, we do not now call to mind the name of any of those engaged in this industry.

Miscellaneous.

Young Veterinarian, Oaks, Pa., asks: 1. In what part of the country would he be most likely to succeed in starting in his profession; 2, the name of a good work on diseases of stock.

ANS.—There are so few skillful veterinarians in any part of this country, and so much injury and loss are constantly caused by ignorant treatment of stock by farmers and quacks, that an educated, honest veterinarian should have little difficulty in establishing a profitable business in any part of the stock-growing States, such as Kentucky, Illinois, Kansas, Colorado, etc. Select some point and write to the local postmaster there either asking his opinion as to the prospects for a veterinarian in that neighborhood, or requesting him to send the name of some one likely to be posted on the matter. 3. The best we know of is Law's Farmers' Veterinary Adviser, price, $3.00.

J. M. H., Kearney, Neb., asks: 1. whether Yucca filamentosa is a bush or a tree; 2, also if that and Callicarpa Americana, Hibiscus Syriacus, Weigela, Deutzia crenata and Geranium sanguineum live out-of-doors all winter; and, 3, how they must be planted.

ANS.—1. Yucca filamentosa is nearly stemless with leaves of a sword shape, from one to two feet long. It is a plant quite hardy, having endured with us 20 degrees below zero, and of striking appearance. It belongs to the Lily family, sends up a stalk four feet or more in hight, which in summer bears a great number of bell-shaped, nearly white flowers. The leaves are evergreen and it is in every way a highly desirable plant. 2. Most of them are perfectly hardy. We must refer our friend to RURAL of Nov. 9 for further particulars. 3. Instructions as to sowing seed will be given in a few weeks.

J. F., Paola, Kansas, desires to know if we, or any of our readers, have had practical experience in making sugar from sorghum or corn-stalks by the process invented by F. L. Stewart, Murrysville, Pa., and described in the Agricultural Report for 1877, or by any other process that has been successful. 2. He also asks if there is any kind of cane seed that has been used for sugar making, and 3, if there is a market for dried sweet corn and its price.

ANS.—1. We cannot give any fuller account of the process than is found in the Report above mentioned. For a short description of the process see the RURAL of Oct. 5, 1878. 2. We do not know of any. 3. For seed, sweet corn is sold for 25 cents a quart. For cooking purposes it sells for $4.00 a bushel.

W. W., Newburgh, N. Y., asks, 1, the name of a reliable New Jersey firm from which peach trees can be bought; 2, the name of some good late varieties of Peaches.

ANS.—Hance & Sons, Red Bank, N. J. We do not know of any nurserymen at Newburgh who sell peaches. 2. Oldmixon Freestone, Jacques, La Grange, Red-Cheek Melocoton, Smock Freestone, Lemon Cling, Morris's White (for canning). There are many new varieties, but we do not know how they may thrive in your section.

J. H. P., Selah, Yakima Co., Oregon, asks: 1, whether an experiment in raising Chufas would be likely to pay well; 2, where Chufas can be bought.

ANS.—We have tried them for three years. It does not pay to gather them by hand labor. Hogs like them and fatten upon them. There is often much gained and seldom much lost by an experiment on a modest scale. 2. See our advertising columns and notice of catalogues.

C. H., Glendale, Mich., asks whether J. J. Gregory's White Russian Spring wheat is the same as Defiance wheat.

ANS.—It is not the same. Mr. Gregory charges $2.25 per bushel for White Russian; Mr. Bliss charges $15.00 per bushel for Defiance. They are both white and beardless. We have tried them both. See RURAL of Sept. 14, which gives the result of our trial, also engravings of each.

J. M. K., Alice Grundy Co., Ia., asks the name of a periodical devoted to tobacco and its culture and where it can be purchased. Many are about to engage in tobacco culture in his neighborhood.

ANS.—The Tobacco Leaf, 142 Fulton Street, this city; subscription price $4.20 per annum. Tobacco News, and Tobacco and Grocery News, $2.50 each, both published at Louisville, Ky.

L. R. P., Helm's Store, Va., asks how many varieties of field corn are known to the RURAL.

ANS.—There are varieties without number. Study our "Corn" number soon to be issued.

PAMPAS RICE, OR DOURA CORN, per lb, $1.50; ½ lb., 50c; oz., 15c.; pkt., 10c. KENNEY'S AMBER SUGAR CORN, per quart, 60c.; pint, 30c.; pkt., 10c. PEARL MILLET, per lb., $1; ½ lb., 35c.; oz., 15c.; pkt., 10c. CHUFAS, per quart, 75c.; pint, 40c.; oz., 15c.; pkt., 10c. For 25 cts. we send 8 pkts. CHOICE FLOWER SEED. All prepaid. Illust'd Garden Guide and Catalogue of 38 pages, describing 500 varieties, *sent free*. Address COLE & BRO., Seedsmen, Pella, Iowa.

RELIABLE HOME-GROWN SEEDS.

Ten Packets for 25c. RURAL NEW-YORKER with *Extra* Premium for $2. Also Rabbits, etc. Send Postal for Circular.

TUISCO GREINER, Naples, N. Y.

FOR 2 DIMES.—One pkt. each of Verbenas, Striped Petunias, Double Hollyhocks, Balsams, Phlox and Pansies. L. D. SNOOK, Barrington, Yates Co., N. Y.

1800 ACRES IN SEED.

ESTABLISHED OVER HALF A CENTURY.

Centennial Grand Prize Medal awarded for Purity, and Diploma of Honor for Superior Quality.

This popular brand of Garden Seeds is exclusively of our own growth, from the choicest selected vegetables; they are the only Seeds in the market that are WARRANTED PURE, FRESH, and TRUE TO NAME.

Merchants, Planters, Gardeners, and all Rural Residents desiring Seeds of undoubted purity and quality, should plant them. Enclose letter stamp for Buist's Garden Manual and Almanac for 1879. 188 pages of useful information on gardening, with prices of Buist's Seeds by the ounce, pound and bushel. A Northern and Southern edition is published. Address,

ROBERT BUIST, JR., Seed Grower, Philadelphia.

E. P. ROE'S $5 List of SMALL FRUIT Plants,

For family use. 22 VARIETIES.

The most LIBERAL OFFER of the Season.

$13 WORTH OF PLANTS FOR $5.

☞ Send for Descriptive Catalogue. Address E. P. ROE, Cornwall-on-Hudson, N. Y.

Seeds, Plants, Trees.

Our combined CATALOGUE OF FLOWER AND VEGETABLE SEEDS, GREENHOUSE AND BEDDING PLANTS, FRUIT AND SHADE TREES AND EVERGREENS, SHRUBS, SMALL FRUITS, &c., &c., mailed to any applicant. Address

CROMWELL & CONGDON, 51 Light St., Baltimore, Md.

Shaker's Garden Seeds.

True and Genuine, Fresh and Reliable.

One of the oldest seed firms in the country. Seeds sent by mail, postage free. Special prices and terms to *Granges*.

"The excellence of the Shakers' Garden Seeds is generally admitted."—*Eds. Am. Agriculturist.*

Illustrated and Descriptive Catalogue of Vegetable and Flower Seeds Free.

Address CHARLES SIZER, Mount Lebanon, Col. Co., N. Y.

FREE TO ALL

D. M. FERRY & Co's ILLUSTRATED DESCRIPTIVE PRICED SEED ANNUAL for 1879

Will be mailed FREE to all Applicants. It contains 2 colored plates, 500 engravings, about 150 pages, and full descriptions, prices and directions for planting over 1,000 varieties of Vegetable and Flower Seeds, Plants, Roses, Etc. Invaluable to all. Send for it. Address

D. M. FERRY & CO, Detroit Mich.

And you will COIN MONEY.

Garden Manual and Price List for 1879 sent free. Address J. B. ROOT, Rockford, Ills.

VICK'S FLORAL GUIDE

A beautiful work of **100 Pages, One Colored Flower Plate, and 300 Illustrations,** with Descriptions of the best Flowers and Vegetables, and how to grow them. All for a FIVE CENT STAMP In English or German.

The **Flower and Vegetable Garden,** 175 Pages Six Colored Plates, and many hundred Engravings For 50 cents in paper covers; $1 in elegant cloth. In German or English.

Vick's Illustrated Monthly Magazine—32 Pages, a Colored Plate in every number and many fine Engravings. Price $1.25 a year. Five Copies for $5.00.

Vick's Seeds are the best in the world. Send FIVE CENT STAMP for a FLORAL GUIDE, containing List and Prices and plenty of information.

Address JAMES VICK, Rochester, N. Y.

Trees, Seeds, Plants, &c.

IT WILL PAY

to grow a liberal family supply of the best kinds of Fruit. For first-class Trees, Plants and Vines to produce the same, send to E. & J. C. WILLIAMS, Catalogues free. Montclair, N. J.

5 Cents Per Bushel Saved

in raising Corn. For Illustrated Pamphlet, giving particulars and prices to agents, address THOMAS SMOOTHING HARROW CO., Geneva, N. Y.

ONLY $1 For TWELVE Ever-Blooming **ROSES**

Strong Plants, your choice, labeled, *free by mail*. 125 finest sorts. Large assortment of Flowering Plants at same price. *New Tea Roses added gratis on $3 orders.* Catalogue free. INNISFALLEN GREENHOUSES, Springfield, O

GOOD CURE FOR HARD TIMES.

A PLANTATION OF EARLY PROLIFIC and RELIANCE RASPBERRIES.

100,000 Plants FOR SALE; *also* 200,000 *Cinderella* and *Continental Strawberry Plants*, Millions of other Plants, Trees, etc. Everything new, novel and rare. *Prices low.* Send for *Descriptive Circular* to GIBSON & BENNETT, Nurserymen *and* Fruit Growers, Woodbury, N. J.

GRAPE VINES.

Also **Trees, Small Fruits, etc. Wholesale** rates very low to Nurserymen, Dealers and large Planters. Send stamp for Descriptive List. Price List **Free.** T. S. HUBBARD, Fredonia, N. Y.

ARTICHOKES.

Red Brazilian and White French varieties; cheapest hog food known. Send for Circulars.

E. F. BROCKWAY, Ainsworth, Iowa.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, FEB. 8, 1879.

We will be pleased to send one or more copies of the RURAL NEW-YORKER *free to any of our subscribers sufficiently interested in its welfare to be willing to hand them to their neighbors for inspection. An intimation by postal card will suffice.*

OUR readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to* THE RURAL PUBLISHING CO., *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

Applicants for seeds will please observe that the postage on ANY POSSIBLE *selection of* TEN *sorts of seeds,* IS NEVER *more than* FIVE *cents.*

A ONE-CENT *stamp suffices for any selection of ten varieties* EXCLUSIVE *of the Beauty of Hebron potato, Pearl Millet and Defiance wheat. If the first of these three is included in the list, then a two cent* EXTRA *stamp is needed, and if the second and third are included, an extra two cent stamp is also required.*

WE offered, some time ago, to sell the cuts used in this Journal for twelve cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

OUR readers are particularly requested to read the particulars of our free seed distribution on p. 97, under publisher's notices, before ordering seeds.

WRITING FARMERS.

IT is rather a favorite "skit" at farmers who write for the papers to say that they don't practice what they preach, and that thus they frequently disappoint those who visit them by the slovenly appearance of their premises, the ill-kept condition of their live-stock, and the weediness and light returns of their crops. This charge has a small sub-stratum of truth to rest upon; and yet a pretty wide acquaintance with writing farmers enables us to declare that the foundation for such ill-natured charges is much less than is asserted by men who may be good farmers, but who are so selfish that they not only won't "do good and communicate," themselves, but enjoy "sitting in the seat of the scorner" wagging their hard heads, and comforting their little souls by exaggerating the defects of their neighbors.

So far as there is truth in the gossip of such men about "writing farmers," the explanation is not at all difficult, nor is it greatly to the discredit of those who are so criticised. There is a limit to the working ability of every man and woman. So much can be done in a day, and then the night cometh, and rest must be taken. The hard-headed and hard-hearted human animal, be he farmer or what not, who devotes all his efforts to his own selfish advancement and cares nothing for the good of others, no doubt has a shade of advantage in mere money-making over his neighbor who is willing to devote a part of his time to the general good—and such is the practice of agricultural writers, as a rule. Certainly there is no branch of literary effort where labor yields so poor a return as in agricultural writing. As yet, so little does the average farmer and his family care for improvement in their own business that, little as they read anyway, nine-tenths of what they do read is the mere news, gossip and scandal of the day, or the blood-and-thunder and cheap sentiment of the dime novel and the story paper. Few men ever earn a dollar by writing upon agriculture.

But in still other ways is the generous-hearted citizen at a disadvantage with the hard-heads in a rural community. Not only will he sacrifice his time and strength by his writing, if he writes, but he is the one upon whom his merciless critics are sure to shirk off all the useful, but pecuniarily unprofitable work of the neighborhood. Both in public and church affairs the thrifty boor and his griping helpmeet are "too busy" to lend a hand; but neighbor Good-Heart and sister Charity are delegated by a unanimous vote—and a sneering laugh in the sleeve—to do the "thank-ye" jobs for the common good. They do them cheerfully, and "great will be their reward in heaven," but on earth it is probable that Good-Heart's farm and Charity's household will suffer in comparison with those of the pious and patriotic neighbors who profit by their exertions, only to "say all manner of evil against them falsely."

We think, and have reason to think, that the readers of the RURAL are of a different class from these hard-hearted and ungrateful people to whom we have referred. We believe they appreciate the efforts of its many generous contributors to advance the knowledge, contribute to the comfort and promote the happiness of the whole. And we believe, too, that if they could visit the farms and the houses of these writers, they would not find them lacking in a practical demonstration of the advantage of a study of their work, or any the worse for the time bestowed in this way for the pleasure and profit of their readers.

EXPORT OF LIVE ANIMALS.

THE necessities of the English nation have far outgrown the home supply, both of breadstuffs, meats, cheese and butter. England has become a vast workshop and mart, and her agriculture has fallen behind in its capacity for supplying the wants of her artisans and merchants. Whether or not the peculiar condition of the English agricultural interest—which exists in a twofold, or rather threefold division, as landlord, gentleman-farmer tenant and laborer, and in which the labor of the last supports the luxuries and extravagance of the other two, is at the bottom of this, need not be here considered; although its discussion would involve some considerations most important to us. The fact is as stated, and its results appear in a demand upon foreign nations for at least one-half of the sustenance of the English people.

Out of this condition of things has grown an enormous foreign business in breadstuffs and provisions, the larger bulk of which has fallen to us in a natural manner, simply because we can supply food cheaper than any other nation. This ability may be, and probably is, a consequence of the very different position of our agricultural interest and social organization, from those of England. The English people, however, want bread and butter, cheese and meat, and we can supply all they lack, with advantage. Their needs will enlarge and our capability of supplying them can increase. In this promised enlargement of our best and most convenient market, lies the most hopeful prospect of our agriculture. One steamer recently sailed from Boston for England with 252 live steers and 4,000 live sheep on board, and this cargo is but one drop in the bucket of the rapidly growing business.

Exports of dressed beef to England began in 1845 as an experiment by the shipment, in October of that year, of 36,000 pounds. In April, 1877, more than 8,000,000 pounds of meat were exported, and from that time the shipment of live stock has become an important part of the trade, and although the export of cattle may be temporarily checked by the expected orders of the British Privy Council, these orders will probably only remain a short time in force, and until their revocation, the increase in our shipments of beef will, most likely, counterbalance any decrease in those of fat stock. The effect of our past trade has been to reduce the price of beef in the English markets from 25 cents a pound to 17 cents. At the latter price it seems as though we should have the market entirely in our own hands from the impossibility of English farmers competing with us on account of the high rents they have to pay for their farms, and the fact that they are not working-men themselves, but must live out of the proceeds of the labor of their workmen. The English laborer and an English farm cannot support two idle men with their families, and produce beef for 17 cents a pound. This seems reasonable to us who find ourselves taxed to do this latter and support ourselves by our own labor. Therefore this outlet for our products seems to be sure and permanent, and we may feel safe in laying out our plans to fill it.

American farmers are a studious class of men, and are wedded to no ultra conservative system. Their farms are happily their own, to do as they will with them. They can grow what crops they wish, and are used to change of methods. Now it is their interest to look out for the new order of things. A vast foreign trade is already in their grasp, and there is a promise of an enormous and early increase of the home markets from the expected revival of a hitherto prostrate business. With such a business outlook before them, farmers must become business men and work their farms on business principles. The main thing is to make them more productive; in what product,—so that it is food,—matters not so much, as that the products should be staple ones and such as will meet with a ready market. Grain, meat, cheese, butter; and whatever can be converted into these, have the whole world for a market either directly or indirectly, and to grow enough of these will demand all our acres, the work of every pair of hands and the thought of every active brain.

CLASS JOURNALS.

ALTHOUGH agricultural journals have a wide distribution, yet they reach but a small proportion of persons engaged in agriculture. "What can an agricultural journal do for a farmer?" is a frequent query with persons who do not understand what such a journal really is. To show what a genuine agricultural newspaper is we might be pardoned for referring to THE RURAL NEW-YORKER, as a bright example of a class journal. Many persons suppose that agriculture is the only industry represented by special journalism. To show how mistaken this idea is, we enumerate a few of the trades and industries that support and are represented by journals entirely devoted to their interests. The shoe and leather and tanning interests have the Shoe and Leather Reporter; the cabinet-makers and upholsterers have the American Cabinet-Maker; the druggists have the Druggists' Circular; there are the American Grocer, the Lumberman, the Millers' Journal, the Millstone, the Manufacturing News, the Manufacturer (for textile industries), the Architect and Building News, the Manufacturer and Builder, the Ironmonger and Iron, the Tobacco Leaf, and scores of other special journals devoted to distinct branches of industry. In these are discussed questions of interest to the readers from their own special stand-points, pertinent news and business announcements, so that no person of his class can be properly instructed and fitted for his business who neglects to study his special journal.

It is precisely so with an agricultural journal. No farmer can hope to keep up to the times—and he must do this to be successful—if he neglects to read some good agricultural paper. As a sample of such it may be entirely pertinent to look within the covers of any number of THE RURAL NEW-YORKER. There will be found items of news of importance to farmers; leading articles discussing broad questions pertaining to our industry; articles on practical subjects from the brains and pens of men who have grown gray in farm work, and whose hands have guided the plow across their fields for years, "whose talk has been of cattle" since boyhood, and who have an inspiring idea of benefiting their chosen and favorite craft and those who may call them brothers. The conductors as well as the contributors are fresh from the field and garden, and spend time and labor in investigating all that may be new in the practice or science of agriculture. From long habit as well as from a sense of duty undertaken, all these are apt to take broader views and deeper insights into matters of daily experience than those who give attention solely to the common routine of the farm. In every walk of life there are those who are called upon to learn and those who must teach. It is part of our human nature that we cannot keep a new idea in our minds; we must be communicative or nothing; and thus it is that a new and valuable idea learned in the stable, the barn, or the field, is at once made known and becomes common property. It is certain, beyond a doubt, that the present vast extension of agricultural industry, and the excellence of our present methods, are the results of the teachings of the agricultural press, just as the corresponding extension of mechanical industries has been effected mainly by the class journals referred to.

As agriculture is the industry of half the population, it is the more important that there should be a sufficient number of agricultural journals of excellence and practical value to furnish all the information and instruction needed. Fortunately the field is occupied by many of the highest character and of the greatest usefulness, and we sincerely hope that they will all of them receive during the present year and in the future the hearty support they so well deserve.

BREVITIES.

OUR free seed distribution has actually begun. We would that it had ended.

ONE can not see himself as others see him. If he could, each of our farmer readers might, we think, point out his own portrait on our first page.

J. J. MECHI writes to the London Agricultural Gazette: "There is still much melancholy in agriculture. Farmers are justly alarmed by American reports and imports."

SEEDS of early Cabbage may now be sown in boxes in any sunny window. So may the seeds of the Golden Rural Tomato in a few weeks—which reminds us of the necessity of haste in our seed distribution.

IT was Daniel O'Connell who wittily emphasized the difficulty of putting a good deal of sense into a few words, by writing to the editor of a Dublin newspaper, "I send you a long letter, *because I haven't time to write a short one.*"

NOW that Scarlet Fever is prevalent, we would say to our readers that far more depends upon careful nursing than upon medicines. Do not ever wake a child up to give it medicines. Nothing is better than warm lemonade or slippery-elm.

GEN. LE DUC has just appeared before a Committee of the Senate to urge that the Agricultural Department should be authorized to keep a strict supervision over the shipment of live stock from this country. More stringent precautionary measures in regard to this matter cannot be too promptly enforced.

AWHILE ago, a hired man was smoking a pipe while standing near the door of the stable. The door was suddenly blown back, knocking the pipe out of his mouth and scattering the fire in every direction. The sparks were put out—but we were reminded that pipe-smoking, even by the most careful men, ought *never* to be tolerated about the barn.

WE CALL THE ATTENTION of our readers to our advertising columns, which are now filling up as spring approaches. It is submitted that the character of these advertisements is strictly in accord with our professions of a desire to consult the interests of our readers as a foremost principle in the management of this journal. If by any misrepresentations on the part of advertisers, deceptive advertisements are admitted, we shall expose them so soon as the fact is ascertained, as, in several instances, we have already done.

THE St. Petersburg Gazette announces that a dairy show on a large scale will be held at Helsingfors in the course of the ensuing spring, and that the Government has granted a sum of 2,400 roubles towards the traveling expenses of country people in poor circumstances desirous of visiting the exhibition. Our politicians, too, are unquestionably deeply interested in dairy matters, and they would, no doubt, have exerted their influence upon the Government to have extended a helping hand to the "country people in poor circumstances" who desired to visit our International.

WE have no doubt that the English sparrow, in a very few years, will so damage our corn crops that we shall not only be ready to let this bird shift for itself but to join in exterminatory measures in place of the kindly protection that has thus far been extended to it. It seems only to have found out during the past season, or so, that corn in the milk is delicious food, and that by a little scratching and pecking a sufficient meal may easily be obtained. In an experimental plot of sweet (black) corn, planted in an out-of-the-way part of our grounds, we had a good opportunity of observing their operations. From the time that the corn was well set until it began to harden, a flock of about fifteen made this their headquarters. They would peck upon the silk end of the ears, open the husk and feed upon the corn as far down as they could manage to pry it open. They destroyed about half of the crop.

DR. H. DE VRIES has been experimenting to ascertain what changes occur in frozen plants. He finds that the ice is formed, *not* in the cells, but in the interstices or intercellular spaces. Hence a bursting of the cell walls, which has generally been supposed to take place, is impossible. The plants remain alive as long as they remain frozen and die only when a thaw takes place. He finds that if the thawing process is conducted gradually, the vitality is preserved. Now, if the intercellular spaces freeze, they must become distended. Why does not this distension rupture the cells upon which they press? Will de Vries tell us that? We presume the cell juices *do* freeze if the cold is intense enough, and that the degree of cold requisite to freeze the cells of different species of plants, varies. When this takes place, must the plant die; or, will gradual thawing save it in this case as in the other? In other words, must the plant perish whose cells or cell juices are frozen?

PRICKLY COMFREY.—A correspondent, one who has raised a large quantity of Prickly Comfrey, says: "Did not the RURAL advocate its cultivation awhile ago?" We reply, yes; and add that the RURAL probably influenced a trial of this plant more than any other journal. But a mistake or blunder, made years ago, is no less the one or the other for being persisted in. The cultivation of Prickly Comfrey was, as far as we know, advocated by the then editors in good faith. Our trials constrain us to believe that it is, as compared with other forage plants, nearly worthless, though we continue to receive favorable reports from here and there. We have placed these before the reader the same as if they accorded with our own views. Nearly every seedman's catalogue offers roots for sale. Our readers, having read all that can be said on both sides of the question, will judge for themselves whether Prickly Comfrey is worth its cost and their time and labor.

EXTRACTS FROM THE REPORT OF THE COMMISSIONER OF AGRICULTURE.

From the last Report of the Commissioner of Agriculture to the President, just received, we make the following extracts which we believe will be of interest to our readers:

Plants for Tannin.—The examination of two new materials, the algarobo and the canaigre, for tannin, shows the existence of a very abundant source of this important material, and gives reason for the belief that the latter, at least, may soon afford a cheap supply to the arts. . . . The importance of a new and cheap source from which tannin may be readily obtained can scarcely be overestimated, and the most diligent prosecution of this search in various directions will be continued until success is assured. The amount of barks and other substances, valued for their tannin, reaches many millions of dollars yearly, and, if the canaigre root answers our expectations, the world's supply may be easily grown by our own people.

Early Amber.—Satisfied of the extraordinary qualities of a variety of sorghum called the "Minnesota Early Amber," I procured as much of the pure, well-cured seed as possible, and distributed the same in every Congressional district in the United States. The results of this distribution have been uniformly favorable, and the variety is recognized as a great acquisition, yielding everywhere a large amount of rich saccharine juice, which, under proper treatment, gives a first-class article of cane sugar and sirup, the yield being from 120 to 250 gallons of heavy sirup to the acre. Mr. Seth Kenny, of Morristown, Rice County, Minnesota, who first made sugar from "Early Amber" cane, writes that he has made, this season, for himself and neighbors, 4,240 gallons of sirup, of which, at the time of writing, he had sold 720 gallons at 10 cents per gallon, and 13 barrels of which were grained into mush sugar. . . . The experiments thus far made have scarcely been sufficient to accurately determine the actual cost of the production of sugar from these sources, but they have sufficed to settle the question of its production with no further care than is required in making good butter and cheese.

Sugar from Pearl Millet, Etc.—In addition to the experiments made with maize and sorghum, other allied grasses were subjected to the same treatment. A few seeds of pearl millet, which had been sown late in the season to test its value as a forage plant, produced a large growth of blades and stalks. The presence of saccharine matter in considerable quantity was so apparent that the stalks were stripped and put through the mill, and the juice gave a fair quantity of readily crystallizable sugar of good quality. . . . An experiment with Teosinte, a small quantity of the seed of which had been procured from Vilmorin & Co., of Paris, was made after frost had cut the leaves of the plant and injured the stalks, and although a fair proportion of sirup was obtained, crystallization could not be induced, and the results were unsatisfactory.

Prospects of Tea Culture.—In the effort to introduce the cultivation of the tea plant and the manufacture of tea, reasonable progress has been made. In Assam, India, the native home of the tea plant, the English Government, recognizing the great importance of the subject, years since undertook the establishment of tea culture, and after many failures and at great expense has at last succeeded in making it a permanent and profitable industry. Here, with a climate and soil admirably adapted to the growth of the plant, and a people whose mechanical ingenuity is always equal to any emergency, there can be no doubt whatever of the ultimate success of this industry, but it must necessarily be of slow growth. . . . From leaves raised in the Department grounds and obtained from the Carolinas and Georgia, experiments have been made in the laboratory after the methods of the Japanese as reported by importers and other authorities, and with such success in some of the samples as to obtain the warm commendation of experts and dealers, who declared the tea made to be "excellent Oolong—as good as could be bought anywhere." . . The question whether our people can compete with the acquired dexterity and cheap labor of Asia will be answered, when the time comes, by mechanical inventions that will do the work cheaper and better. Meanwhile nearly every family in the Middle and Southern States may grow their own tea, and better tea than they at present buy in the general markets, if they do nothing more.

Analysis of Grasses and Green Manuring.—The analysis of our native grasses has been extended to thirty-nine species, and has already resulted in the conclusion that there exist very many uncultivated grasses which may fairly claim equal merit with many of our standard varieties.

Attention has been directed also to numerous plants without any reputation as forage plants, but which, flourishing vigorously upon worn-out soils, are looked to as the means of the ultimate restoration of such lands to fertility by their employment in green manuring; a method which, with clover, rye, buckwheat, and other crops, has been productive of such excellent results—an unfailing and inexpensive resource, and often the only remedy within the means of the average farmer.

The determination to institute a thorough research in this direction has been very much encouraged by a recent conversation with that eminent chemist, Dr. St. Julian Ravenel, of Charleston, S. C. The results obtained in some experiments made by him in utilizing the vetch and the beggar-lice weed of Florida as preparatory forerunners for a crop of wheat in the sandy, barren flats near Charleston, are so wonderful that the experiments will need to be repeated under personal inspection several times before we can feel sure of such favorable results as the usual sequence to such simple means.

Sugar Manufacture, from Chemist's Report.—The sorghum was a variety known as the Minnesota Early Amber. Both corn and sorghum were in a condition of vigorous growth when cut, the leaves being green. The seed of the sorghum was sufficiently mature to warrant its preservation, and indeed, the last lot received shelled slightly upon handling. The sorghum had not been planted or cultivated so as to produce even a fair average in size, as will be seen by the results appended.

The mill made use of in expressing the juice was an old sorghum-mill of common construction, which, through previous use and misuse, had been rendered quite unfit to give satisfactory results. After most of our experiments below given were concluded, it was repaired, so that afterward its working was very much better, as will be seen by the subsequent results given further on. . . .

The process in brief is as follows: After topping or stripping the corn or sorghum, it was passed through the mill, and when sufficient juice had been obtained, it was heated in the copper tank to a temperature of 82 dg. Centigrade—182 dg. Fahrenheit. After the juice had reached this temperature there was added to it, with stirring, cream of lime until a piece of litmus paper dipped in the juice showed a purple or bluish-purple color. The heat was now raised to the boiling-point, and so soon as the juice was in good ebullition the fire was drawn, and a thick scum removed from the surface of the juice.

The experiments here given clearly indicate that sugar may be thus made at a profit, and it is desirable that nothing be spared in continuing an investigation giving such fair promise of success.

RESULTS OF EXPERIMENTS IN THE MANUFACTURE OF SUGAR FROM MAIZE AND SORGHUM.

Number.		Pounds of raw stalks.	Per cent. of juice in raw stalks.	Pounds of juice used.	Specific gravity of juice.	Pounds of sirup made.	Per cent. of sirup in juice.
1	Corn-stalks, stripped and topped	2,353	35.29	830	1063	74	14.33
2	Corn-stalks, stripped and topped	2,783	33.91	597	1061	101	19.92
3	Corn-stalks (butt ends), stripped and topped	3,568	29.04	971	1053	142	14.62
4	Corn-stalks (top ends), stripped and topped	2,547	19.94	488	1050	65	13.46
5	Corn-stalks (top ends), stripped and topped	3,052	37.97	1,099	1057	146	13.33
6	Sorghum, stripped and topped	2,860	32.06	848	1057	135	16.71
7	Sorghum, topped, but unstripped	3,624	36.75	958	1057	145.5	15.30
8	Sorghum (butt ends), unstripped	1,324	47.49	445	1059	73	16.41
9	Sorghum (top ends), unstripped	1,322	43.16	498	1057	58.5	14.70
10	Sorghum (top ends), unstripped	1,290	41.49	346	1053	57	16.47
11	Sorghum (butt ends), unstripped	1,126	34.09	291	1059	41.5	14.26
12	Sorghum, small stalks, stripped	963	56.20	538	1059	103	18.95
13	Sorghum, large stalks, stripped	515	56.55	290	1060	60	20.00
14	Sorghum, small stalks, stripped	1,623	55.87	781	1061	156	19.97
15	Sorghum, large stalks, stripped	1,549	58.01	711	1064	158	22.22

When the sirup reached the density above indicated, it was drawn off into wooden tubs, the fire having previously been drawn from beneath the evaporator. . . .

It was intended to have still further concentrated the sirups in a smaller pan of galvanized iron, so arranged that by a slide the heat could be instantaneously removed to prevent the scorching of the sirup; but before this plan was completed it was found that the several tubs of sirup were crystalizing, and they were therefore allowed to stand, and the sugar was obtained by pressing out the molasses by means of an ordinary screw-press, the mass of molasses and sugar from the tubs being inclosed in an ordinary grain bag.—To be continued.

Literary Miscellany.

PARSON WILLIAMS'S SABBATH BREAKING.

On the grave of Parson Williams
The grass is brown and bleached,
It is more than fifty winters
Since he lived and laughed and preached.

But his memory in New England
No winter snows can kill;
Of his goodness and his drollness,
Countless legends linger still.

And among those treasured legends
I hold this one a boon,
How he got in Deacon Crosby's hay
On a Sunday afternoon.

He was midway in a sermon,
Most orthodox, on grace,
When a sound of distant thunder
Broke the quiet of the place.

Now the meadows of the Crosbys
Lay full within his sight,
As he glanced from out the window
Which stood open on his right.

And the green, fragrant haycocks
By acres there did stand;
Not a meadow like the Deacon's
Far or near in all the land.

Quick and loud the claps of thunder
Went rolling through the skies,
And the Parson saw his Deacon
Looking out with anxious eyes.

"Now, my brethren," called the Parson,
And called with might and main,
"We must get in Brother Crosby's hay,
'Tis our duty now most plain!"

And he shut the great red Bible,
And tossed his sermon down,
Not a man could run more swiftly
Than the Parson in that town.

And he ran now to the meadow
With all his strength and speed;
And the congregation followed,
All bewildered in his lead.

Ha! not often on a Sunday
Such sight as this, I ween,
Of a parson and his people,
A New England town had seen.

With a will they worked and shouted,
And cleared the fields apace;
And the Parson led the singing,
While the sweat rolled down his face.

And it thundered, fiercer, louder;
And dark grew east and west;
But the hay was under cover,
And the Parson had worked best.

Not a moment had been wasted;
The rain was falling fast,
As the Parson and his people
Through the village breathless passed.

And again in pew and pulpit
Their places took composed,
And the Parson preached his sermon
To "fifteenthly," where it closed.

When the services were ended,
The people talking stayed,
And among the sternly pious
There were bitter comments made.

And the good old Deacon Crosby,
A meek and godly man,
Hardly dared rejoice his haycocks
Had been saved on such a plan.

But the Parson came down, striding
In haste, the narrow aisle,
And the Deacon's bent old shoulders
He patted, with a smile.

And he said: "No fear, my brother,
Lest God think it is a sin;
For he sent the sun to make your hay,
And your friends to get it in."

[H. H. in the Independent.

WEAKER THAN A WOMAN.

CHAPTER XXVIII.

Lady Chevenix wrote a long letter home, telling her mother how greatly she was enjoying Paris—how she had been to one of the State balls at the Tuileries, and how the Emperor had danced with her—and Mrs. Haye, on her side, made all the ladies round Lilford envious by telling them how her "dear child, Lady Chevenix," was enjoying herself in Paris, and what a favorite she was at the Imperial Court.

Sir Owen was very kind to Violet in those days, and she was so completely dazzled by the novelty of all she saw that she never remembered Felix, except to congratulate herself on her own good sense in having given him his *conge*. Some slight indications of impatience made her think that Sir Owen had a certain amount of bad temper, but at present he had shown none to her—indeed she thought him far better than he had represented himself. He had told her that he gambled and drank. She had seen nothing of these bad habits; she was too inexperienced to detect that he had placed a restraint on himself which might break down any day.

She did not like him very much. Although he was a Baronet and a man of wealth, he was not a thorough gentleman. She found that Sir Owen was coarse in his manners, coarse in his speech. She often, even in those early days, shrank from, him saying—

"You talk so strangely, Owen—I do not understand you."

"Then you must have some lessons, my charming wife," he would answer laughingly, following up the remark by speech that was anything but refined.

That was done in good humor; what he could be when that humor changed she had yet to find out. She did not love him—she never made the least pretense of loving him. She was kind to him; she tried to talk to him, to amuse him; she obeyed his wishes, and made herself very amiable and charming—not because she loved him, but because he was the means of procuring her all the luxury, the magnificence, the pleasure that she now enjoyed. In his coarse way he felt that.

He brought her home one day a set of sapphires so brilliant and rare that she cried out with rapture when she saw them.

"There are no sapphires finer than these," he remarked. "What do you say for them, Violet?"

"I say 'Thank you' with all my heart," she cried.

"Is that all, Violet?"

"What more can I say, except that you are good, kind, and generous?"

"Can you think of nothing else, Violet?" he asked. She looked puzzled.

"I cannot indeed, Owen; but I will say anything you wish me to say."

He turned away impatiently.

"If you thought any set form of words, any pretty phrase would please me, you would use it—I am quite sure of that."

With the brilliant sapphires in one of her hands, she looked half wistfully at him; the man who had it in his power to make such presents as this was worthy any amount of patience.

"I would say anything to please you, Owen," she said.

He looked into her fair face.

"I know you would," he returned; but it has never occurred to you to throw your arms round my neck and kiss me, and—and say, 'Thank you, my darling.'"

She shrank from him with a little shudder, his dark face was so close to hers.

"I have noticed," he said, "that you are always ready to thank me when I bring you any of the silly trifles women like so much—you are then most amiable; but never once, by Heaven, since we have been married have you come to me and kissed me of your own free will!"

"I will do so now," she said; and she placed the sapphires in their cases.

"No, thank you," he returned. "It would not be spontaneous. You would do it because I asked you."

She was startled by the expression of his face, at the tone of his voice—startled, and just a little afraid.

"You do love me, Violet, do you not?" he asked.

She had never thought about loving him; he was to her a rich man who had wanted her to marry him, who had bribed her by his riches and his title, and for whom she had given up the man she really loved; but to love him—she had never thought of it; it had never entered into her calculations. He was to have her beauty, she was to have his money and his title.

"Do you love me, Violet?" he demanded angrily; and before she had time to speak a sudden conviction darted through her mind that she did not love him and never should—a certain terrible conviction that, although she was married to this man, she loved Felix Lonsdale still.

She trembled as she answered—

"Yes, you know I love you, Owen."

She knew the words were false, but she was too frightened to say anything else.

"I know you ought to love me," he said savagely; "but there is no understanding a woman—fair dealing is not characteristic of the sex. Still I should not like to think that you married me for my money, and for nothing else. Did you, Violet?"

She was not clever at lying, although she had broken a noble heart by her weakness. She had not the quick ready fashion of speaking falsely which she acquired afterwards. She buried her face in her hands; it was easier to weep, after the weak fashion of women, than to speak.

"Nay, I did not mean to pain you, Violet," he said. "Do not cry. Still I should like to know that you love me. No man would like to think that his wife had married him for his money."

After that little scene Lady Chevenix did not feel quite so sure of her husband, and began to stand a little in awe of him.

* * * * *

The gay French capital might be as gay as it would, Sir Owen would not remain. Invitations poured in upon him and his beautiful young wife—he would not accept them. One of his fixed resolves was to be in England at Christmas, and to England he was determined to go. In vain Violet pleaded that Garswood at Christmas would be dull. He laughed at the notion.

"No place is ever dull where I am, Violet," he cried. "That shows how little you know me. I shall fill the place with visitors of my own choosing—and I promise you that we shall not spend our time in singing psalms."

That was the first dissension between Violet and her husband. She would fain have remained longer, but Sir Owen was tired of Paris. He liked English sports, English habits, and English cheer. He was angry that Violet should for one moment presume to like Paris. It was unheard of, he said, that any Englishwoman should find Christmas at home dull. And that was the first time that Violet saw him in a rage. He swore loudly—not at her—that was to come later on. He declared the whole race of women foolish and idiotic. He frightened her so that she was glad to escape from his presence and give orders for packing up.

"I am not my own mistress, after all," she said, with a discontented look on her fair face—"I cannot do as I like. I never dreamed that I should have a master."

She did not like the idea. She had been so free and unfettered all her life that it was new to her to be under control. She had yet to learn that Sir Owen had the obstinacy of twenty men, and that when he had once set his mind upon anything he would carry it through. Her wishes, caprices, fancies, and desires would have about as much effect upon him as summer waves have upon a weather-beaten rock.

She had a sample of this when they reached Calais on their return to England. It was not wet weather, but there had been a terrible gale, and

the sea was rough. Violet was a bad sailor, and when she heard the surf beating on the shore, she begged of her husband to delay their passage at least twenty-four hours. She was so afraid, she said, of a rough sea.

He laughed. It was all nonsense—the sea would not hurt her. No one ever heard of an accident to the Dover and Calais boats.

She allowed that; but the passage made her very ill. Would he not wait?

"If you are ill, you will soon be well again; the whole passage does not occupy two hours. You must bear it as other people do."

"I did not think you could be so unkind to me, Owen," she said piteously.

"I am not unkind; but I warn you fairly that I have very little patience with the caprices of women. As for their own nonsense, I should never bear it. A man cannot be expected to go on honeymooning forever. That kind of thing is all over now, and we may as well take our proper places. Mine is to be master—and I tell you frankly that I intend to be obeyed. Make up your mind to that, and we shall get along all right. Thwart me, and we shall not agree."

They were not very pleasant words for a bride of only a few weeks to hear. She thought over them for some time.

"Felix would never have spoken to me in that fashion," she said to herself. "But I must obey. There is no help for it—he is supreme master."

She was very ill crossing the Channel; but Sir Owen only laughed. Seasickness was a sort of jest to him. He never dreamed that his young wife would resent the laughter, but she did. When they landed at Dover, she would not speak to him. He might be master, she said to herself, a hundred times over; but no man should laugh at her.

"You are sulking with me," he said laughingly. "Ah, my Lady Chevenix, you will find that a losing game! I do not think there is a person in all England—man or woman—who can sulk so long or so thoroughly as I can myself;" and that she found to be perfectly true.

Neither of them had the faintest idea of self-control—it was a thing unknown to either of them—so they reached Garswood without exchanging a word on the journey. Their coming home was quite unexpected; consequently there was no rejoicing. It was night too, and cold. Sir Owen was not well pleased at their reception, although he had expressly forbidden any one to write.

But Violet's spirits rose again when she found herself in the magnificent mansion. After all, her husband might be coarse and bad-tempered, but she was mistress of those superb rooms. This was her house. She was to live in the midst of all this luxury, with troops of liveried servants at her call. Still she did not say to herself now that it was all hers. She was beginning to understand that for her everything depended on the humor of her husband. It was not all hers. She was so pleased that Sir Owen recovered his good-humor, and the first evening they spent together at Garswood was perhaps the happiest they ever had there.

On the morrow Sir Owen found a hundred things that required his attention; nevertheless he was thoughtful about his young wife.

"You will like to see your mother and father, Violet," he said. "Order the carriage when you like. I cannot go with you, but I will come for you. You bought some presents for them, did you not?"

"Yes," she answered.

She looked wistfully at him. It was her first visit since her marriage, and she would have liked him to be with her; but she was beginning to understand that she must not interfere with his arrangements. She could not resist saying—

"I should enjoy it so much more if you were with me, Owen."

"Oh, no, you would not!" he laughed carelessly. "You only fancy so. You and your mother will have so much to talk about that I really could not stand it, you know—I could not, indeed. I will be there in the evening, and will drive you back home."

She knew that to say more would be quite useless, so she made the best of the arrangement. After all, there were many delights before her. She had a superb costume, trimmed with costly sable—one of the great Worth's masterpieces—and she was to wear that for the first time. Her heart beat as she thought of the pleasure of driving in her magnificent carriage through the streets of Lilford, dressed in her Parisian costume.

"I hope that I shall meet Lady Rolfe," she said, "just for the pleasure of cutting her."

She drove at once to the Limes, and was met with the kindest of welcomes.

"I should have gone to meet you, Violet, had I known that you were coming," said Mrs. Haye.

But Lady Chevenix thought that under the circumstances it was just as well she had not come.

They went to the drawing-room together. Francis Haye was more of an invalid than usual that day, and his daughter, on hearing that he was asleep, would not have him disturbed.

"Let us have a long talk, Mamma," she said. "I have so much to tell you."

They sat down to exchange confidences, and Mrs. Haye almost trembled with delight as she looked at her daughter.

"How well you look, Violet!" she said. "What a superb dress, and how it becomes you! Are you very happy, my dear?"

"As happy as other people, I suppose, Mamma. I am very rich—and that must mean that I am very happy. It will take me a whole day to show you my dresses and jewels."

Will you stand up, Violet? I feel quite sure that you have grown; or is it the new style of dress that suits you?"

Violet stood up.

"I have grown, Mamma," she answered. "You know I am only just twenty; I may grow taller still."

"You are quite tall enough to be graceful, my dear," said Mrs. Haye; and her eyes lingered proudly on the lovely face with its dainty bloom, so young, so fresh and fair, and on the graceful figure that was shown to such advantage by the costly dress that swept the ground. "You have improved very much, Violet," she added.

In that she was right; Violet had a grace and refinement that gave her an additional charm.

They talked long, and not unhappily. Presently Violet produced her presents. Mrs. Haye went into a rapture about a dress of Genoa velvet and some superb Mechlin lace. After that Violet began to inquire about her old friends.

Mrs. Haye had many little facts to relate about all of them.

"Mamma," said Lady Chevenix, with a slight flush on her face; "what do they say in Lilford about my marriage and me?"

"What can they say, my dear? Every one envies you, every one talks about this wonderful marriage."

Violet took up the rich tassels of her dress and played with them. She never raised her eyes to her mother's face.

"But do they—I mean, have they said that I did wrong?"

"Wrong!" cried Mrs. Haye. "Why should they? Which of them would not have done the same thing? Which of them would not be pleased to do the same wrong?"

Lady Chevenix looked relieved.

"I was afraid they would say I had acted unfairly," she said slowly. "Mamma, how are the Lonsdales? How is Felix?"

There was a brief silence before the question was answered, and then Mrs. Haye told her wonderful story.

"You have never heard of such a change of fortune, Violet," she said; "it is almost as wonderful as your own; I can hardly understand it. The Lonsdales seem to have all the business of the town now, and of the county too. They have—I cannot tell how many clerks; they give grand dinner-parties; and, what seems to me stranger still, they are frequently invited to Bramber Towers."

"We shall visit there, I suppose," remarked Lady Chevenix. "I am pleased indeed to hear all this, Mamma; if any family ever did deserve good fortune, they did. They are recognized by the county now, I suppose?"

"Yes, quite. Lady Rolfe has taken them up. I hear of nothing but the Lonsdales."

There was silence again for some minutes, and then Violet said slowly—

"And Felix, Mamma—have you seen him since my marriage?"

"No, not once, my dear," was Mrs. Haye's reply. "I need hardly say that he has never been here."

"Do they say—do you know, if he thought much of it?" Did he make a great trouble of it, Mamma?" she asked.

"I cannot say," replied the cautious mother; "I have never heard the subject mentioned."

Lady Chevenix was silent again. After a little while she said quickly—

"I should like to ask you one question more. Does Felix—has he found any one else to care about yet?"

"I have not heard so, Violet, my dear, you have every blessing the world can give; do not think about him. And, if you will take my advice, you will not talk about him—Sir Owen might not like it."

"I shall be careful, Mamma—I shall not speak of him; but I wanted to hear about him just once."

She said no more then, but as she sat in the familiar room she thought a great deal of him; it was impossible to help it. The quick eyes noted how completely every trace of him had been removed; the books that he had given her, the pictures, were all gone.

"They need not have banished everything," she said to herself.

Presently her father awoke; he was delighted beyond measure to see her looking so well and so beautiful.

Later on Sir Owen came, and they spent a pleasant hour together. But there was a dreamy look on the lovely face, a softened light in the clear eyes; she could not help thinking of the past bright girlish life that had been so simply happy. Felix had been part of that life, and she could not help remembering him when she thought of it.

She enjoyed herself, she laughed and talked, she told gay anecdotes of her triumphs in Paris; but as she quitted the house, she carefully avoided going near the bare lilac-bushes, or lingering for a moment at the garden gate. As she drove home she said to herself—

"I do not think I shall go to the Limes very often. After all, the pain is as great as the pleasure."

But she did not own what the pain was.

CHAPTER XXIX.

During the next few days Lady Chevenix was occupied in arranging all the beautiful ornaments, pictures, and statues she had brought with her from abroad. Amongst the treasures of her girlhood was a small rosewood writing-desk. On it she had written all her love-letters; in it she kept every love-letter she had received; and she remembered now that she had not destroyed them before her marriage, and that she ought to have done so. She was alone in the sumptuous room that was her boudoir. The apartment was perfect in its way, and the golden-haired girl who stood in it looked like a fitting occupant.

She took out a little key and opened the desk. How well she remembered the perfume of violets—the faint sweet perfume that she had always liked so much! There lay the great bundle of letters tied with blue ribbon—letters on which a life of love and passion had been wasted; there too lay the portrait that Felix had given her when he came home from college—a portrait that had seemed to her one of the finest works of art. She would not open the letters; it would be folly to irritate old wounds. She would burn them; she ought to have burned them before her marriage but her mind had been in such a whirl then she had not thought of it.

She went to the fireplace and stirred the fire into a bright flame. She had not thought what she was about to do would pain her—it had seemed an easy thing to burn old letters; but, when she placed the first bundle in the midst of the flames, it seemed to her that she was burning a living thing. Alas for the love wasted in them, the passion, the pathos! It seemed to her that she was torturing Felix again; the hiss of the flames was like a reproachful voice. Still it must be done. One after another she threw them all in, until the last was destroyed. By that time the color had died from her face, and her hands trembled.

Then she came to the portrait; of course she must destroy it. And what was that folded so carefully in the tissue-paper near it? A spray of lilac, withered and dead! She remembered the day and the hour when it had been gathered. She took the portrait in her hands; there could be no harm in looking at it for the last time. The noble, handsome, frank young face—how she had loved it once! How those eyes had watched her—how those lips had kissed and worshipped her! It must go. She looked at it intently for a few minutes, and then she held it over the flames; but she could not destroy it—she could not see the flames leaping round that face. It was impossible. She wrapped up the portrait quickly, and locked it out of sight.

White and breathless with emotion, her hands trembling, her heart beating, she looked up suddenly as her husband entered the room.

"What are you doing, Violet?" he cried. "Are you ill? You look as if you had seen a ghost."

"I have seen one," she replied slowly.

"What have you been burning? The grate is full of burnt paper."

She looked at him with wistful eyes. Their expression did not please him.

"I have been burning all the old letters I found in my writing-desk," she replied.

Perhaps she had an idea that he would say something kind to her; but he laughed contemptuously.

"What sentimental simpletons women are! Are you going to keep that shabby little desk here? It spoils the room," he said.

"I thought it quite a grand piece of furniture once," she replied.

"Did you? Your ideas have altered on many subjects, no doubt. I came to ask you to ride out with me."

Her head ached with repressed emotion, but she dared not refuse. She had learned one lesson already, and that was that she must keep her husband in a good humor if possible. Now that the novelty and restraint of her presence were wearing off a little, he was beginning to indulge in fits of temper that startled her. She must keep him in good humor. She dressed and went out with him.

"Why do you always select the Oldstone Road?" she asked him.

"Because I like Oldstone far better than Lilford. Most of my property lies in Oldstone. I intend to go to Oldstone church when I go to church at all, and I shall patronize Oldstone generally."

A painful sense of disappointment stole over her, but she dared not express her feelings. She had pictured herself, in all the pride of her new state, rustling in her costly silk up to the old-fashioned aisle of the dear old church at Lilford, to which all her old friends went. She would have liked to see Felix again, to see how he looked and whether he had altered. She wondered what he would think of her in her new grandeur, and felt curious as to where and how they would meet. Then she remembered their terrible parting, and said to herself that she must not think of him.

She never saw him. She went several times to Lilford—more than once she drove past Vale House; but she never saw him. Then Garswood filled with guests, and her time was no longer her own. She ought to have been perfectly happy. She was mistress of the most magnificent home in the county; she had every luxury that money could purchase; she was *feted*, admired, flattered; she received unwonted homage. The local papers were full of descriptions of the galeties and amusements going on at Garswood, and gave a list of the fashionable visitors gathered there; and every now and then came some reference to the great beauty of Lady Chevenix. The ladies of the neighborhood, reading this, looked at each other in wonder, as though they would have said, "Can this be the girl we knew as Violet Haye?"

(To be continued.)

WHAT HAPPENED TO SEVEN GIRLS IN TEN YEARS.

MARY WAGER-FISHER.

A WEEK later, Mary Cake penned *her* "ten years" of doings.

NASHTON, Jan. 27th, 1877.

WALTER, RAYNOR, BIDDLE, ROSWELL and JAYNES: All hail! And so it is expected that Martha and I will tie on our "tale-pieces" and send the kite flying up Cairns's Point way? But mind you all, I shall keep strong hold of the string, and draw in all the little bits of paper that may get tied on hereafter.

My biography of the past ten years!! Indeed, and that is easily given. Why, any one of you could write the whole of it on your smallest finger nail; "Got married and have two babies." But you all look disappointed and are, may be, hungry for one of "Mollie's yarns." Will even take in a little exaggeration, eh?

Being a Methodist, I suppose I ought to be able to extemporize a little and drum up something to outshine Roswell's wandering, eventful career, Walter's prosperous ways on this side and the other of the Atlantic, and the power Biddle has acquired during the past ten years of killing people stone dead, with a few doses of medicine.

I see *now*; I should have kept a *journal*, I remember I began one when I first came home and persevered with it until each day's record was only a duplicate of its predecessor; "Have remained home to-day, and nothing unusual has occurred," was the sum and substance of my life with few variations. Walter's visit with Mercy in '68 was one of those variations when the fingers fly so merrily over the keys, that the music floats in through every crevice of the heart and the air swells grandly up through the whole.

In the spring of '69 (May 20) I was married to James K. Chapin of Nashton. Sit down, Lee Jaynes, and keep quiet! You know as much about that variation as *I* do. I don't know exactly how it came about that I got married, for I always thought I *shouldn't*, but if I *should*, I had pictured to myself (as you all may remember) a husband fair and sandy, with blue eyes and "mutton chops." But I didn't get any such kind of a "*feller*," girls. Why! he is blacker than I am, if anything, and that you know is unnecessary.

I again saw Walter when passing through New York on my wedding trip. Came home to begin a *married life* which glided along rather evenly, until the fall of '71, when I remember a short piece of a visit from Mary Roswell. Thanks for that short favor, Molly! Oct. 27th found me in New York on a visit to Mercy. This visit furnished change and amusement until the following June, when I gave birth to a boy, and we called him Johnny Cake! (delicious you know.) The seasons following the birth of Johnny were closely filled in with maternal cares until the spring of '76, when I launched out into housekeeping. Had barely got settled, when the Grand Exposition opened. I thought I wouldn't do the Centennial *this* time, but staid at home and celebrated by receiving another little black head. Girls! can you imagine how I look dangling my own babies and singing "Hush-a-bye," etc.? I do the thing up in shape (honest.)

In summing up these events of the past ten years, I haven't lost sight for an instant of our home in Richmond. I have looked up several times, to make sure that I am not writing there in the old room. I can peek across the hall at Walter and Raynor and invite them to go down with me into Roswell's and Jaynes's room and get some hot coffee with condensed milk. Kate Hawley is brushing outside the key-hole and our portly matron steps out of her den when she smells the coffee and hears us shouting. Lee, I thought you would marry that chap who wrote you such great long letters! Roswell if I were rich, I should be tempted to start at once for California and see you in your own "home." I congratulate you most heartily on your happiness. Walter! how did you feel when you fell in love? I'm coming to see you if fortune favors me, for I must confess I want to see how you act as a married woman. Mercy! hold fast to your profession and mind you don't get caught in the noose before you know it. By way of self description, I will say that I am the same old chick. I suppose I have grown old by ten years, since I saw two of our number, but I dont feel it.

No doubt each of you, save the two old maids, has the best husband in the world. So have I. My married life is very peaceful, and though you may wonder how any man can live with me, and not quarrel, I can truthfully say we never have, and my husband is no idiot either.

My boy will match yours, Roswell. I only hope he will not prove like a false fire-cracker, that flashes up when first lighted as though a tremendous snap was in it, and then fizzles all out. The little girlie is as sweet and winning as the angels in heaven.

Martha is able to vindicate her own course; but shake hands with me girls across the sheet, that she still remains single, and things look *now*, as though, if occasion required, she might take the *enviable* position of "Aunt" in my growing family. Receive in conclusion my choicest benediction and remember I am always ready to receive and embrace you.

MARY CAKE CHAPIN.

NASHTON, Feb. 7, 1877.

DEAR SPIRITS OF '67:—Very gladly I fall into line of battle in this grand army of facts and figures, while endeavoring to lap my life onto ten years ago and see what comes out between. Summer of 1867—we parted then, and into what different paths! These few letters shall reveal *my* life: *Uneventful*. Autumn of '67, went to Alexandria, Va., as work still remained to be done among the Freedmen and the opportunity still remained to me to bear some part in it. At home fall and winter of '69, doing little. From spring of '69 until '70, teaching in Nashton. Fall of '70 went to Illinois to join an old friend; our object, to see what the West might offer as a business opening. Unsuccessful and returned to Nashton, determined to see what kind of a business woman I could make in my own town, and accordingly joined myself to a Mrs. White, of like mind as myself, and we started in and still continue together. Our sign swings "White & Cake," and we are often addressed "Dear Sirs." The success we hoped for in the beginning has been sadly interfered with by the hard times, but those wise in the tricks of the trade say we should be satisfied in that we have been able to meet our bills, and have, I hope, steadily gained in name and fame. I have a pretty store, centrally located, with well appointed millinery, fancy dry goods—and in the rear a department for giving women "fits;" so that if you walk in some pleasant afternoon, you may find me measuring tape over the counter, or striking my most persuasive attitude before some semi-beguiled mortal, with a "love of a bonnet" on her head. I can hardly say with Biddle that I am satisfied to live and die in my vocation, for an aged milliner might get a feather askew, while the old family doctor is a treasure of wisdom and skill. However, for the present I am content. This is home, and the family number remains unbroken.

Personally, the ten years have left their marks, I suppose. The gray hairs grow plentiful and the crows' feet creep into the corners of the eyes, but the heart is amazed at the passage of time.

And now, girls, my story is ended. My heart and home are open to you all, to you and yours.

As ever, MARTHA CAKE.

(To be continued.)

RECENT LITERATURE.

Hampton Tracts. For the People. Sanitary Series, Nos. 1 to 5. New York: Putnam & Sons. Price 8c. each.

THE first of the series is by Helen W. Ludlow, and has for its subject The Health Laws of Moses; the second is on the Duty of Teachers, by E. W. Collingwood; the third, Preventable Diseases, by Mrs. M. F. Armstrong; the fourth, Who Found Jamie? by Helen W. Ludlow; the fifth, A Haunted House, by Mrs. Armstrong. These useful little books deserve to be extensively read. The "tracts" are condensed and strong statements of the fundamental laws of health, with illustrations of the results of breaking these laws, and advice as to the best and easiest way of living in obedience to them. The editing committee promise that the series "will provide, as simply and in as attractive a manner as possible, carefully prepared information upon all points directly connected with physical life,"—as cleanliness of the person and house, ventilation, drainage, care of children and invalids, preparation of food, etc.

MAGAZINES FOR FEBRUARY.

SUNDAY AFTERNOON comes laden with good things. Our experience with this magazine during the first year of its existence, leads us now always to expect that every number will contain bright, suggestive papers on social reform topics, nor are we ever disappointed. The February number contains the following articles of this class: A Pair of Home Missionaries, As to Sunday Dailies (a capital article), The Littleton Reformers, (a paper which all women could read to advantage), and At the Door of the Tabernacle, each and all of which will repay perusal. Caroline Healey Dall contributes a paper on that charming woman, Anna Jameson. Ministers and Hobbies, by W. M. F. Round; A Conventional Conscience, What is Conscience, The True Story of Hans Christian, Paper Roses, A Just and Faithful Knight of God, Sunday in Water Street, Kasina Al Anwar, and The Still Hour, comprise all the articles in the body of the magazine. The Editor's Table discusses Where is the Church? Theatre Going; Notes on Current Events.

THE PHRENOLOGICAL JOURNAL, opens with a life-like portrait and phrenological and biographical sketch of Senator John P. Jones, of Nevada. It contains also portraits and sketches of the late Bayard Taylor, American Minister to Germany, and also of the Marquis of Lorne and Princess Louise.

The chapter on Brain and Mind discourses on Organic Quality, its nature and influence, illustrated with nearly a dozen engravings. Strange Plants are also illustrated. The Unfolding of Mind through Conflict and Sin is an interesting paper.

The Health Department is well sustained by the articles on Dietetic Delusions; Experiments in Magnetism; and the Proper Position in which to Sleep, while our social relations as men and women are discussed in Single-Blessedness; Can the Sex of the Human Cranium be determined? There is also a great amount of valuable information in the Editorial Department, Answers to Correspondents, etc. The publishers of this Journal have made a reduction in price. It is now published at $2.00 per year, with liberal premium offers to subscribers.

PROF. EMIL DU BOIS-REYMOND opens the Popular Science Monthly with an able article entitled Darwin *vs.* Galiani, in which the rival doctrines of *teleology* and *natural selection* are discussed and compared in a very instructive and dispassionate way, although the writer is evidently a strong believer in the latter mode of accounting for the phenomena of organic life. Prof. Joseph Le Conte follows with a second and concluding paper on the Scientific Relations of Sociology to Biology, pointing out in this article the true position of Sociology as the chief of all the sciences, how it has been made possible through the development of others, and how it is characterized by the possession of methods and data that are peculiarly its own.

The Crystallization of Gold, Silver, and other Metals, by Thomas J. Gregan, is an illustrated and untechnical account of the various beautiful crystalline shapes taken by some of the precious metals, and the conditions under which the phenomena occur. In the next article, Herbert Spencer before the English Copyright Commission, we have some strong common sense forcibly applied to a very important question; and few, after reading it, will fail to understand why Mr. Spencer was called before the Commission a second time. The Formation of Mountains is an illustrated account of a series of experiments performed by Prof. Alphonse Favre, of Geneva, to show the formation of the great irregularities of the earth's surface by means of lateral thrust and crushing due to the process of cooling.

People who believe in "bumps," as well as those who would locate the mental faculties a little deeper than the scalp, will be interested in "The Old Phrenology and the New," by Dr. Andrew Wilson. With the aid of illustrations the writer makes sad work with the professions and teachings of the old phrenologists, and shows how much more reasonable is the explanation which recent science has to offer. "Backgammon among the Aztecs," by Edward B. Taylor, is an instructive paper, on the high antiquity and wide diffusion of one of our common games. "Planetary Rings and New Stars," by Prof. Daniel Vaughan; "Mites, Ticks, and other Acari," by E. R. Leland (illustrated); "Typhoid-Fever Poison," by Dr. Ely Van de Warker; and a sketch by Prof. George B. Prescott of Mr. Elisha Gray, who is introduced as "the inventor of the Speaking Telephone," and of whom a portrait is given, fill up the body of the number.

The departments are all good, the Editor's Table and Popular Miscellany especially so. The former contains some trenchant remarks on the "Morality of Copyright," and an explanation of the present attitude of science toward the question whether the so-called elements are elementary or not.

New York: D. Appleton & Co. Fifty cents per number, $5 per year.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

THE SAFEGUARD.

A BABY crept to his father's knee,
And was lifted up and lulled to rest,
Till the blue eyes closed, so tired was he,
And his little head fell peacefully
At ease on the ready shoulder there,
While the baby hand so soft and fair,
Lay like a shield on his father's breast.

Of old 'twas said that when men drew near
To fierce temptation or deadly strife,
And lost their way in a maze of fear,
Or periled their souls for worldly gear,
By a way unknown an angel band
Would lead them out of the dangerous land,
Into the light of a noble life.

The story is true for the world to-day:
We see no white-robed angels mild;
But out of the dark and perilous way
Where men and women forget to pray,
Into the peace of a purer land
They are led by a gentle, shielding hand,
The hand of a little helpless child.

[Elizabeth W. Denison, in Sunday Afternoon.

LETTERS FROM A COUNTRY GIRL.—No. 11.

MARGARET B. HARVEY.

AND now I would like to talk a while about music. Of course, what I have to offer upon the subject will be of little practical value to those who have no instrument. So I will linger long enough to say, *Get one!* One woman will say she cannot afford it, another, that she won't have any until she can buy a Steinway grand. But friends, while you are waiting, your time is passing, your fingers are stiffening, and your taste is settling into a perpetual crudity. Don't be above starting with a low-priced piano, and the knowledge gained upon it may either aid you or encourage you to procure a better one. I venture to say, that if you use as little as seventy-five dollars for this purpose, you will be able to receive more than the worth of the money in return, even if you buy second-hand. As for organs, you can purchase just as good a new one as anybody needs for a hundred dollars. But I suppose every woman must have her heavy black silk and her gold watch and her Paisley shawl, whether her house is adorned and her mind cultivated, or not. It is her business, not mine.

Music, I believe, is the highest art, the noblest science and the grandest pursuit which can occupy the human mind. Of all things earthly, it exercises the greatest sway over mankind, and of all things earthly, it is the most incomprehensible. How can we explain why combinations of certain notes fill the heart with a sense of pure joy, holy sentiment, elevated patriotism, or yearning tenderness, and anon deep sadness and wild despair? And this not by any trick of form or color appealing to the eye,—not by any set phrase or idiom, conveying an exact, unmistakable meaning,—but simply by vibrations striking the ear. It seems, indeed, an unutterable language between soul and soul, the struggling efforts of a wandering, awful spirit to speak to us who but faintly comprehend, the tongue in which only seraphim can fully hold converse; the one reality of this lower world that we expect to find again in heaven.

OPERATIC MUSIC.

Thinking thus of music, it must follow that I consider an opera the sublimest product of human genius. When through a long extended composition any mortal man by such feeble instruments as mere sounds can control a mighty multitude, and compel its members at his will to experience in rapid succession, simple pleasure and careless joy, and deepest longing, intensest grief, fiercest hate, noblest sacrifice, highest hope and grandest triumph, I say, his creative and governing energy is something godlike. He is greater than a poet, for it is the poet's thought as echoed in the strains to which it is wedded, that is carried home to the heart and life to remain forever; he is greater than a painter, for his songs fly through the air and are transported bodily into far distant regions in which the picture is scarce heard of; he is greater than builder or monarch or conqueror, for his work remains indestructible long after theirs has crumbled into dust. The more we know of music, the more angelic we may become.

I hope at this late day, that I have shocked no one by coming out so strongly in favor of the opera. If I have, he or she is the very one who does not know how largely operatic music has entered into our every-day life. The sweetest songs and the most beautiful hymns that we have, might be described by this term, which many have learned to pronounce so contemptuously. For instance, "The Last Rose of Summer," is "operatic,"—it is from Martha: "Sleep, Gentle Mother," is from Il Trovatore: "Then You'll Remember Me," is from The Bohemian Girl. The church tune Ovio, is from Norma: Fading Light, from Der Freyschutz, while that grand air Seymour, or Von Weber (as it is sometimes more fitly called), is from Oberon, by the same author, Weber. And many a time, I hope, has your heart swelled and your eyes filled with tears to the enchanting strains of Manoah, by Rossini.

Now that some of my friends mean to set out in earnest and *play*, I would advise them right here to learn all about operas that they can. This does not touch upon the question of *going* to the opera, which I leave for others to discuss,—but covet a knowledge of such music above all other kinds. And when you have fairly learned your scales and gained control over fingers, and are ready for a "piece," attempt something classical. There are easy arrangements for beginners, no more difficult, if one determines to *work hard* and *count correctly*, than many pages of exercises. Don't, ladies, *don't* fool away your time on exercises, take at once something which will draw you out, and which, when thoroughly mastered, will be, after all your endeavor, a possession of some value. When with infinite trouble you have learned a lot of little runs and tinkles, you don't want to play them, and nobody cares to hear them. If the object of practicing them be to gain freedom of hand, this can be attained just as surely on a real composition,—only, don't get discouraged. Make it a rule *never* to give up a piece after having once commenced it, even if you don't know it for months. The next one will be ten times easier.

BALLADS AND POLKAS.

Don't waste your hours and energies upon common ballads, polkas and schottishes. There is, usually, nothing in them but a "cute" trick of expression, or a rather "smart" jingle, of which one soon grows weary. And as they depend on exact rendition for effect, they require practice which might be far better employed. You can just as well learn Meyerbeer's exquisite song, "Thy Flowery Banks, O Flowing River," from the Hugenots, or one of Abt's melting melodies, "When the Swallows Homeward Fly," or "Guardian Mother," as you can learn "Johnny Morgan," or "Whoa, Emma!" Instead of noisy, bombastic, stamping marches, written by nobody knows nor cares whom, take the really spirited and magnificent ones from Faust and Norma. A careful student had far better be busied with Mendelssohn's Songs without Words than with some trifling, merely pretty Snow Drop or Rose Bud pieces. We are immortal beings, remember; we have plenty to do in these lives of ours, and we cannot afford to choose less than the best,—not only for the time involved, but the influence upon us. If we want our hearts made pure and our tastes refined, we must first of all give preference to those things best calculated to do this for us.

Because I have exalted the opera and kindred music, I do not mean to imply that there is no merit in less pretentious compositions. But I do say, set up a high standard first, and if possible, reach it, then you will be able to judge of good elsewhere. Nothing, however humble, if wrought out in a sincere, loving, tender, unselfish spirit, is worthless, so you must aim to cultivate not only a correctness but a breadth of taste. You will often find a priceless gem, like Wilson's Shepherd Boy, among the mountains of rubbish around you.

THE SPIRIT OF MUSIC.

As a general rule, that which comes the nearest to swaying completely the emotions, approaches most nearly to perfection. Dance music, with which, alas, too many of our girls spend their leisure, is of little real value. It serves only to please the ear during the brief excitement of the passing hour. For seasons of melancholy, of loneliness, of aspiration and of faith, it has nothing to give. Those who cultivate a love for soft reveries and wailing miserere and divine psalms, will seldom find their playing unacceptable and unappreciated. Yet if you must have dashing waltzes, choose those which have more to recommend them than their sparkling movement—those which sing of flashing waters and swaying tree-tops and reveling fairies. Such are Strauss's compositions which have a witchery inimitable. He who can hear unmoved the brilliant, "Beautiful Blue Danube," or the charming "Thousand and One Nights" must be callous indeed. Of course, you will find it profitable to learn a few simple polkas and cotillions to amuse the children,—but don't consider them part of your *own* music.

VOCAL MUSIC.

So far I have spoken only of the piano. Many persons eminent for their musical culture have pronounced it a very imperfect instrument, giving preference to the violin and the organ. This may be true, we would all, I think, rather hear gay sounds in the orchestra and solemn ones in the church, than in our parlors. But as an accompaniment to the voice it would be difficult to find a substitute available for our homes. It is claimed that its notes are sharp and clear-cut, having neither the human-like thrilling of the violin nor the blending swell of the organ, but for singing, this is no drawback, as the vocal tones must rule the instrumental ones. The fewer and simpler the chords the better. Never believe that the most expensive piano or the greatest facility in execution will ever take the place of a good voice. Whatever else you do, *sing*. Women in the country, I believe, have a better chance to practice the high notes than women in the city. Let one of the latter scream in her room, and she may be sure it will be known, and her breaks too, but one of the former may go out into the woods, as I have repeatedly done, and gain control of her abdominal muscles and expand her chest and exercise her vocal chords with no fear of intrusion. Let your improvement in singing keep pace with your advancement in playing. It is a high art to be able to sing well to a correct accompaniment, simple ballads, and the old, familiar Irish, Scotch and "darkey" songs are always fresh and sweet.

I have supposed that you are going on without a teacher. Of course, the more lessons you can take the better; but, at the same time, no one can do your work for you, and nothing need hinder your doing it by yourself. You can learn all the keys and scales from a manual, and after that it is all practice. But it is a little more difficult. I think, to learn to sing by note without a teacher. You can only become able to read by picking out the notes one by one and trying them on the piano, and then striving to grasp the true sound with the voice. Yet keep on and on, and bye-and-bye, as an eminent organist said, you will "begin to see."

ORGAN PLAYING.

Now a word to the lady who has an organ. You will probably first want to play familiar church and Sunday-School hymns, as perhaps you would if you had a piano. This is well, for in any pursuit, make it yield you pleasure and profit as soon as possible; but don't let this be all. Just as grand composers have left music suitable for the organ as any for the piano. Think of your rich heritage of chants, masses, oratories and sonatas. There are published books of voluntaries made up of selections from the wonderful creations of Mozart, Handel, Hayden and Beethoven. Any music dealer can send you such a book on application.

Again I will say, practice. You must try if possible to get in, at the very least, a half-hour's work daily—but as much more as you can, short of neglecting things more important, that is, if anything *is* more important than your rest and comfort and culture. But I know that some of your neighbors will talk, and say you are giving yourself airs, or leaving duty undone. I might say, "Don't mind them," but I know you *will* mind them, at least, enough to be annoyed even if you are not frightened into giving up your effort. Yet you can remember that if you overlooked a hundred little odds and ends of time, in which you might just as well be seated before the instrument as idle by the fire, they would find no fault with you, and you would end by knowing nothing,—then you can choose, determining which fate would be the more dreadful, to be talked about, or to be ignorant. But I shall suppose that you have decided wisely, so I will tell you, for your encouragement, that I know of a young man who learned to play on a painted board and succeeded finely. Better do this than not attempt—for he learned the correct fingering of many difficult pieces, and when he did get a piano at last, practice soon took the stiffness out of his hands. I shall have to talk, one of these days, about habits of study, so that I can make you believe that you have time if you will take it. And now I will close by saying, success to your music. Success need not necessarily mean amazing ease in execution, nor ability to perform a difficult composition (a very simple piece is frequently very beautiful), nor the power to show off in public, though it may include all of these. But it *does* mean amusing the children, entertaining a friend, comforting a dear one, or mingling in private worship, in short, adding to the pleasure, the loveliness and the devotion of the home.

OLD MAIDS AND OLD BACHELORS.

J. S.

OLD maids are useful. They can cook, sew and take care of children, nurse sick people, and generally play the piano. Old bachelors are useless. They do not even know how to drive nails or split wood.

Old maids are amiable. If one wants anything done that requires patience and kindness of heart, a single lady is sure to be the one to do it.

Old bachelors are ill-natured. They snub children, despise babies, and hate young mothers, and are always so busily employed in seeing that other people take good care of them that they have not a moment to give to anyone else.

Old maids are nice looking, and "young for their years." Old bachelors generally have red noses, rheumatism in their knees, bald heads, and mouths that turn down at the corners.

Old maids can make a home of one little room, and cook delicious meals for one over the gas-jet in cunning little tin-kettles, besides making all their own wardrobes. Old bachelors need an army of tailors, waiters, cooks, distant relatives and hotel landlords, to keep them comfortable. When old maids are ill they tie up their heads in pocket-handkerchiefs, take homœopathic pellets out of two bottles, alternately, and get well again. When old bachelors are ill they go to bed and send for four doctors; have a consultation; a mantlepiece full of black bottles; all the amiable married men who belong to the club to sit up with them at night, besides a hired nurse; they telegraph to their relations; and do their best to impress the world with the idea that they are dying.

When an old maid travels she takes a sandwich, a piece of pound-cake, a bottle of lemonade in a hand-basket, and lunches comfortably in the carriage. When an old bachelor travels he orders a dinner in courses at the station, and raves because he has not time to eat it before the "fifteen minutes for refreshments" are over.

Old maids drink weak tea and it cures their headaches.

Old bachelors drink strong liquor which gives them headaches.

Old maids are modest; they think their youth is over and their beauty gone. If, after a while, some autumnal love is given them, they take it as a sort of miracle, and hope people will not laugh at them for "marrying so late in life."

Old bachelors believe that all women are in love with them, and that they must carefully guard themselves from traps laid to inveigle them into matrimony. They also fondly cherish the belief that should they eventually become married men, the world expects them to exhibit great taste in women by their choice, and that the "other fellows" will laugh if their portion be not tender youth and beauty; also that when they marry, many women will expire of jealousy.

BE HAPPY.

T. A. GERE.

NATURE, everywhere, tells us to be happy. Never mind your age, cheerfulness is not a reproach to gray hairs. Take a hint from the leaves of the trees. How they chatter with the squirrels and laugh at the dew drops all summer! Yet, when they fall, how gladly they mingle in a merry romp or joyous dance in the breezes of autumn.

A POSTPONEMENT.

THE illustrated article on Painting on China, promised for January, was delayed in consequence of our inability to procure just the engravings we wanted. We hope to be able to get them in course of a few weeks.

In response to many requests we shall give designs in Crewel Work, in RURAL of February 15.

RURAL of March 1st will contain illustrations of Cross-Stitch, a style of ornamentation very much in vogue for embellishing household linen.

News of the Week.

Monday, Feb. 4, 1879.

MISCELLANEOUS.

The fleeces of the Angora goats in Mariposa county, Cal., sell from 70 to 90 cents a pound. The excess of exports over imports for the six months ending December 31, 1878, was $148,888,036, as against $102,159.169 for the six months ending December 31, 1877, and for the year ending December 31, 1878, $304,642,571, as against $140,056,112 for the year ending December 31, 1877. The yellows in the peach is root difficulty, says Meehan in Gardener's Monthly. Sitting Bull's people are nearly starved and are anxious to make almost any terms for peace, but the chief himself says he will never again cross the line. The Senate has passed the House Refunding Bill without dissent and the Consular and Diplomatic Bill, and the Naval Appropriation Bill. On Thursday it passed the important Bill modifying the existing law of patents; and twice during the week it refused by party votes to take up Mr. Edmunds's uncomfortable resolutions concerning the enforcement of the Amendments. The House has good-naturedly extinguished the bill of Mr. Wright, the Pensylvania Communist, providing for a Government loan of $500 to every person wishing to avail himself of the Homestead Act; and has debated the bill introduced by Mr. Goode, of Virginia, devoting the proceeds of the sale of public lands to the common schools of the several States in proportion to their illiterate population. On Tuesday the House passed peremptorily, by 155 to 75, the bill from the Committee on Labor and Education restricting Chinese immigration to fifteen on any one vessel.

Many eggs are now sent to London from Continental countries in cheap coffins, instead of boxes or barrels. The coffins sell for more than cost, and the shippers make money on the packages as well as the goods. Here's a hint for some of our farmers in other things as well as eggs. The bill repealing the charter of the Louisiana Lottery Company passed the Louisiana Senate Wednesday with an amendment that the law shall take effect after March 31. A bill to punish tramps has been introduced into the lower branch of the Legislature of this State. It provides that any person going about from place to place, begging beyond the limits of the town where he is an actual resident, shall be deemed a tramp, and be punished by imprisonment in the State prison for not more than fifteen months. Any tramp who shall enter a dwelling-house, or kindle a fire on the highway, or on the land of another without consent, or be found carrying dangerous weapons, or threaten injury to any person or estate, shall be imprisoned in the State prison for not more than two years. Any tramp who wilfully and maliciously injures a person or estate, if the act is not now punished by imprisonment in State prison, shall be imprisoned in state prison for not more than five years. Any act of beggary or vagrancy by a person not a resident of this State shall be evidence that the person committing the same is a tramp. The act is not to apply to females or minors under 17 years of age, or to blind persons.

Wade Hampton is going to Florida to recruit. United States District Judge Blodgett is undergoing investigation at Chicago by a congressional committee for his alleged corruptions. A United Judge too! Secretary Sherman says he has been erroneously credited with estimating the cost of the new pension bill at $150,000,000. From the best information he can get it will cost anywhere from $36,000,000 to $100,000,000. A suit for the recovery of the Arlington estate by the family of Gen. Lee, has been in progress for some time at Alexandria, Va. It was confiscated during the war and used as a cemetery, chiefly for the remains of colored troops, of whom 40,000 were there interred. The Lee family say that it did not belong to the General, but to his wife, and was therefore illegally confiscated. The case was concluded Thursday afternoon. The jury was only out a few minutes and returned a verdict for the plaintiff for the whole property in fee. Ejectments will now lie against Kaufman, who is in possession of the cemetery, and Strong, who has the rest of the property except the portion occupied by Maria Syphax, which is not in controversy. The defendants entered a motion for a new trial; bills of exceptions will be made as soon as possible and be signed by the court at Richmond.

The Michigan lumbermen have been figuring up the work that they have done in years past, and it scares them, almost, to find how much territory they have cut over. Since 1853, 9,000 million feet have been cut in the Saginaw valley alone, and logging is going on there at the rate of 500 million feet yearly. In 1866, only 600,000 lbs. of wool reached Galveston, Texas; ten years afterwards, it received 2,000,000 lbs., and this year its receipts have already reached upwards of 2,500,000 lbs. Over $25,000,000 of coin obligations, including $1,400,00 United States notes, have been paid during the current month, yet the coin in the Treasury has steadily increased. A field between Norwalk and Los Angeles, Cal., produced last season a crop of barley, a crop of corn and then a crop of potatoes. The Nez Perces Indians are willing to cede their lands, amounting to about 4,800 square miles, to the Government for six townships in the Indian Territory and $250,000 in money. The Interior Department agrees to these terms and Congress is to be asked to make the necessary appropriation.

There is mourning in Warren County, New Jersey. Many a house is in trouble, and will be for months to come. Ex-officials and some of the present ones have been in the habit of stealing systematically. They raised checks and forged and didn't seem to think it wrong to help themselves from the public crib. Now they have been brought up with a round turn. For some time their trials have been going on, and this is the result: Ex-Clerk Mattison, four years in State Prison; ex-Director Strader, two years; ex-County Collector Cammins, two years; ex-County Collector Teel, two years; ex-Freeholder Bulgin, eighteen months; Freeholder Cox, eighteen months; Freeholder King, one year; ex-Attorney Givins, eighteen months; Councilman McDermott, one year—all at hard labor; Contractor Sliker, six months in the county jail and $500 fine. There are other indictments. The happy result of this prosecution of dishonest officials seems to have had an encouraging effect upon other communities similarly burdened, and already in three other counties within a radius of fifty miles of this city, various corrupt officials have been indicted and stand a good chance of getting their deserts.

Now that specie payment has begun and that there is a good deal of talk about the small amount of money apparently in circulation, it may be of interest to compare the amount per head of circulation now and at different dates in the near past. From the following tables it will be seen that the periods of public prosperity and business briskness by no means necessarily correspond with periods in which the volume of money in circulation was the largest. This table gives the amount of paper and specie in circulation at intervals of five years before 1860. As the banking reports before the war were insufficient, it is probable that these figures do not include all the bank issues in circulation, but if we add, say, $20,000,000, or about 10 per cent., to the amount of paper here given, the allowance will be ample to make up this deficiency:

Year.	*Bank Paper.*	*Specie.*	*Total.*	*Per Capita.*
1835	$121,032,292	$59,646,994	$180,678,286	$12 07
1840	113,664,443	34,574,829	148,239,272	8 68
1845	89,608,711	44,241,242	133,849,953	6 66
1850	131,266,526	45,379,345	176,745,871	7 60
1855	186,952,223	53,944,546	240,896,763	8 93
1860	207,102,477	23,594,537	230,697,014	9 30

Several hundred millions compound-interest and short-term notes which the advocates of inflation reckon as currency are excluded from the table. Since 1860 the currency per head has nearly doubled and the volume has increased 130 per cent, taking $310,000,000 as the volume for that year. In the previous thirty years population increased 145 per cent. and nine States were added to the Union; imports and exports increased respectively 411 and 442 per cent. and the currency increased 178 per cent. In the eighteen years since 1860 population has increased 50 per cent. imports and exports have increased respectively 28 and 45 per cent. and the currency has increased 130 per cent. The contrast may be more clearly shown thus:

THIRTY YEARS, 1830-1860.

Increase in	*From*	*To*	*Per cent.*
Population	12,866,000	31,443,000	145
Total imports	$70,877,000	$362,166,000	411
Total exports	73,850,000	400,122,000	442
Cotton manufactures	26,000,000	116,000,000	346
Currency	104,000,000	290,700,000	178

EIGHTEEN YEARS, 1860-1878.

Increase in	*From*	*To*	*Per cent*
Population	31,443,000	47,000,000	50
Total imports	$362,166,000	$466,872,000	28
Total exports	400,122,000	743,942,000	85
Cotton manufactures	116,000,000	200,000,000	70
Currency	310,000,000	713,000,000	130

It will, of course, be understood that estimates are used here in some cases, for example, for population and value of cotton manufactures in 1878, and for population at quinquennial periods.

Here is the amount of money in circulation since the outbreak of the war. For the sake of getting it in conveniently here the table has been divided into two sections, but in studying it, the reader should consider the second merely an extension of the first:

Year.	*National Bank Notes.*	*Legal Tenders.*	*Coin.*
1865	$146,138,000	$432,688,000	$18,072,000
1870	299,767,000	356,000,000	18,460,000
1873	347,267,000	356,000,000	19,868,000
1875	354,408,000	375,771,000	8,050,000
1878	319,652,000	346,743,000	30,688,000

Year.	*Fractional.*	*Total.*	*Per Capita.*
1865	$25,006,000	$621,904,000	$17 70
1870	39,876,000	714,105,000	18 52
1873	44,799,000	767,934,000	19 20
1875	42,129,000	780,378,000	18 40
1878	16,150,000	713,233,000	16 00

FOREIGN.

MeMahon has resigned the Presidency of the French Republic, Mons. Grevy has been elected for seven years to succeed him, Gambetta has been chosen as President of the Chamber of Deputies instead of Grevy, and all this has taken place with as little public disturbance or danger as if the changes had occurred among our own order-loving people, instead of among our turbulent and excitable Gallic friends. The French Republic may now at last be considered definitely established.

The Russians have waked up to the discovery that the plague is among the trophies they brought home from their campaign against the Turks, and there is much alarm in all western Europe. The disease first made its appearance in the southern province of Astrakhan, on the Caspian sea, and has rapidly advanced up the valley of the Volga to Nishnii-Novgorod, in the heart of the empire, and but a little east of Moscow. It comes upon a people weakened by war and famine, with the number of physicians reduced one-third by the conflict with Turkey and the typhoid fever that followed it, and with very inadequate sanitary regulations. It was neglected at first, too, till it has acquired such malignity as to carry off 90 per cent of those it attacks. The governments of Russia, Germany and Austro-Hungary have but recently taken strong measures against it. Should it further increase, however, Germany, will establish a military cordon of 80,000 men on her frontier. The international sanitary commission have sent doctors to study the disease and adopted a pretty strict quarantine. The plague has not appeared in Europe before since 1844, but the terrible desolation it has caused in passed centuries—it victims numbering 25,000,000—naturally excites alarm and justifies every precaution. Though it is one of the great historic scourges of mankind, the proper treatment of it is hardly so well understood as that of yellow fever, and as a rule it kills whomever it hits when it has become epidemic.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

HOUSE-WORK.

THIS is one of the most comprehensive compound words in the English language. It expresses the elements of home life in a multitude of phases. Every department of housewifery is included in its definition. A person versed in house-work is qualified to make home comfortable, enjoyable and happy. House-work is not merely kitchen drudgery; it combines the elegancies and comforts of home as well as its labors. As wealth increases, as refinement progresses, so the duties of house-work multiply, and the advancement of education makes an increase of care and labor in this department, likewise. In the last fifty years the change of programme in house-work has been more marked than in almost any other department of labor. Half a century ago one room was used for sitting-room, dining-room, kitchen and, not unfrequently, sleeping-room. The parlor or square room, was never opened, unless upon state occasions. All the preparations for the family cooking were made upon the long kitchen table. The pantry was a little seven-by-nine closet, as far from the fire as possible, and was used as a store-room for everything. One set of plates was sufficient for all the varieties of food set out for a family meal. Plain, coarse, but wholesome fare was sufficient for diet. Strong home-spun cloth was the clothing of the whole household. A garment once made, did duty for a year at least.

Now, look at the contrast! Sitting-room, dining-room and kitchen are always to be kept in order, and are in constant use. The pantry is the manufactory where all the comestibles are fabricated. Dish washing is one of the hardest jobs of the whole day. Certainly no less than three courses of plates would answer for a family dinner, and frequently more are required. Sweeping and dusting are daily occupations, and then the cooking! Such varieties of dishes, pies, cakes and what-not! It requires a busy head and nimble hands to do the work for a family of moderate size at the present time, not speaking of the making and mending, the darning and patching that are a branch of housewifery. A thorough, practical knowledge of house-work requires more brains than are needed to become a lawyer or a physician. To run the complicated machinery so as to have no jars or friction, is a science in itself, and is certainly a very important department of education, in which young women ought to be well versed. It calls into exercise all the faculties of the mind and body. One needs the wisdom of Solomon and the patience of Job to practice all the details of every-day life.

And yet we have all around us those who, day after day, go through the routine, and look, and are happy and contented with their stations. Doubtless, they have hard days and aching heads and backs, but they understand their business and equalize their daily labor. They do not undertake to crowd the work of three days into one day. They know themselves, and understand how much they can endure, and do not overtask themselves. This is a great secret in house-work—to undertake no more than one can easily accomplish. House-work is one of the most requisite branches of a girl's education, and public attention is being roused up to the facts of its utility. The time has arrived when house-work is appreciated. FARMER'S WIFE.

HOUSEHOLD NOTES.

SOME time ago a gentleman taking dinner with us, said: "What piece of the beef is this? what do you pay for such meat?" My husband said, "This is an inferior piece of meat, cheap, and one that few will buy; but the manner of cooking it makes it so tender." After washing the meat, we put it in a large covered pot with some drippings, fat or lard, and butter; and place the pot over a hot fire and let it remain a few minutes until it is well browned to close the juice cells. Then we salt the meat, pour into the pot about a quart of water, set it on the back part of the range and let it steam until done, which, as we use very large pieces of meat, will take from two to three hours. If the water boils away, add more hot water.

Many people, excellent housekeepers in every other way, say they cannot can tomatoes so as to have them keep. I boil them until the scum stops rising, and add nothing except a little flour and water, when preparing them for the table. When opened, they are so natural in taste as to be as good as fresh ones. I put them in glass jars and treat them the same as any canned fruit.

We tried a new way of keeping green corn this year, and it is a success. Cut the corn from the cobs without cooking. Have an earthen pot ready; first put in a thin layer of corn, then a layer of salt, and so on alternately until the pot is full. Then cover with a plate pressed down so that the brine will cover it and exclude all air. Before the corn is used it will require to be freshened by soaking it over night in water. A teaspoonful of sugar, added in cooking, improves it. Beans (string) can be kept in the same way. Though I've never heard of it, I see no reason why peas, shelled, couldn't be kept too. The corn and beans must be packed as soon as cut, or they will spoil.

Servant girls are the torments of housekeeping. When we secure one that knows how to work, she is either dishonest, untruthful, or so "touchy" there is no living with her. What can we do about it? MRS. E. E. O.

CURE FOR FROST-BITES.

THIS is an excellent cure for frost-bitten feet, fingers or ears: Let a small quantity of lard boil until thoroughly done; then immediately, while boiling, pour it upon a cake or piece of ice. Let it remain until it is cold as the ice itself, after which take it up. It will be more like wax than lard. Apply this to the afflicted part in liberal quantities, and bind it on with a cloth. This is a remedy for freshly frosted members, or for frost-bites of former years. When the feet are sore from old frost-bites, it is a good plan to soak them well in tepid water in which is dissolved a little alum, after which apply the lard, prepared as stated.

H. V. A.

CURE FOR A COLD.

MY mother wishes me to tell the RURAL boys and girls how to cure a cold without drinking hot drinks that cause one to sweat and then so easily take more cold. Put a teaspoonful of ginger into a pint of cold water, enough sugar to make it good, and drink as nearly all of it as is possible before going to bed. My brother's remedy, thirty years ago, when a boy, was to drink, as nearly as possible, a quart of just cold water on retiring.

A WISCONSIN WOMAN.

DOMESTIC RECIPES.

Cream Cabbage.

Wash, cut fine, boil until tender, and drain the water from it. Brown two tablespoonfuls of butter in a saucepan; put in the cabbage and pour over it a teacupful of good cream; season, and let simmer for half an hour.

To Cook Salsify.

Wash the roots, and as the outer skin is scraped off throw the roots into cold water. They require nearly an hour's boiling in plenty of water; throw in with them a little salt, a small piece of butter, and the juice of half a lemon. Serve with rich gravy or melted butter.

To Stew Carrots.

Half boil, then scrape and slice them, into a stew-pan. Add to them half a teacupful of any weak broth, pepper and salt to taste, half a teacupful of cream, and a salt-spoonful of sugar; simmer until tender, but not broken; before serving, thicken with a bit of butter rubbed smooth in flour. If liked, chopped parsley may be added ten minutes before dishing.

Venison Steaks.

Cut them from the neck, and season with pepper and salt. When the grid-iron has been well heated over a bed of bright coals, grease the bars and lay the steaks upon it. Broil them well, turning them once, and taking care to save as much of the juice as possible. Serve them with some currant jelly laid on each slice. MRS. S. L.

Oat-Meal Bread.

Will some of our friends please give Mrs. L. S. N., directions for making oat-meal bread?

Fish Fritters.

Take the remains of any fish, which has been served the preceding day; remove all of the bones, and mince fine; add equal quantities of bread crumbs and mashed potatoes; stir in two beaten eggs; season with pepper and salt; add enough cream to make the mass of the proper consistency to mold into little balls, and fry them in boiling lard.

Egg Sauce.

Boil three eggs hard; cut them into small squares and mix them in good butter sauce; make very hot and squeeze in some lemon juice before serving.

Turnip Soup.

This soup should be made, all but adding the turnips, the day before it is required.

Stew a knuckle of veal with an onion and a bunch of sweet herbs in six quarts of water; cover closely and stew gently five or six hours; put in a cool place; the next day remove the grease, fat and sediment; cut five or six turnips into thin slices and stew slowly in the soup until tender; then add half a pint of cream; thicken with a little flour and butter, and season to taste.

Mock Hash Venison.

One teacupful of gravy, two or three cloves, a little allspice, one tablespoonful of red currant jelly and the same quantity of port-wine; thicken with a trifle of flour. Season to the taste; cut some thin slices from a cold leg of mutton and simmer in this gravy for a few minutes. MARY B.

QUESTIONS ANSWERED.

Mrs. M. B., wishes a cement for fastening a brass top on to a glass lamp.

ANS.—Take three parts of resin, one part of caustic soda and boil in five parts of water; when the ingredients are dissolved and the liquid partly cold, mix with half its weight of plaster-of-Paris.

Mrs. E. M. G. wishes directions for coloring blue on cotton.

ANS.—Dissolve seven ounces of copperas in sufficient warm water to cover three pounds of cloth; put in the goods and let remain one hour, airing often; then take out and rinse through two clear waters. Dissolve one ounce of prussiate of potash in the same quantity as before of warm water, and add one tablespoonful of oil of vitriol; stir up well; put in the cloth and let remain another hour airing in the same way; then rinse and wash in cold water.

OUR FREE SEED DISTRIBUTION.

SEEDS of the following varieties of plants are offered to our subscribers without any charge whatever (except for postage, a part of which we bear) until further notice:

DEFIANCE WHEAT. A hybrid spring wheat. The most promising variety ever before offered.

"PEARL" OR "EGYPTIAN" MILLET. One of the most promising fodder plants known.

BEAUTY OF HEBRON POTATO. According to many careful tests, this is ten days earlier than Early Rose, as good in quality, and more prolific.

THE VOORHIS WATERMELON. A specialty of the Rural Farm.

GOLDEN RURAL TOMATO. A specialty of the Rural Grounds.

ACME TOMATO. This is offered as the best of the newer varieties of Tomatoes to those who may prefer it to a trial of the Golden Rural.

NEW BRONZE RICINUS. Specialty of the Rural Grounds. The most beautiful Ricinus in cultivation. A cross between Ricinus Gibsonii and R. sanguineus.

HIBISCUS MOSCHEUTOS—the showy and beautiful Rose Mallow, never before offered so far as we know. Hardy.

CALLICARPA AMERICANA (Purpurea). The brilliant French Mulberry. Hardy.

HIBISCUS SYRIACUS. One of the most charming of hardy shrubs. Sometimes called "Rose of Sharon." Our seeds are saved from double-flowering varieties—many of them from seedling plants. They grow readily from seeds, and bloom as soon as plants would if transplanted from nurseries. The seedlings "sport" without end.

WEIGELA. Seeds saved mostly from seedlings. This is probably the finest hardy shrub in cultivation.

DEUTZIA CRENATA fl. pl. Seeds saved from seedlings at the Rural Grounds. Seventy-five per cent. of seedlings will bear double flowers. It is perfectly hardy and there is no finer shrub known for ornamenta grounds.

HIBISCUS MILITARIS. Hardy and beautiful.

ERYNGIUM LEAVENWORTHII. The most striking annual of recent introduction. (See RURAL of November 9th for engraving of this and other plants, seeds of which we offer.)

GERANIUM SANGUINEUM. A true geranium of great beauty. Perfectly hardy.

YUCCA FILAMENTOSA. Every farmer and lover of plants should have specimens of this perfectly hardy evergreen liliaceous plant in his grounds. It is superb.

VITIS HETEROPHYLLA. See RURAL, Nov. 9, for description of this hardy vine.

RURAL HYBRID AQUILEGIAS. Beautiful, hardy perennials of great beauty.

GRINDELIA SQUARROSA. See RURAL of Nov. 9 for remarks.

OBSERVE.

Any ten of the above require a one-cent postage stamp:—that is, ONE *cent* for the ten, not for each except the Beauty of Hebron Potato, Pearl Millet and Defiance Wheat. The Beauty of Hebron requires a two-cent extra stamp and the other two a two-cent extra stamp also.

Other varieties *may be* added. We intend this free seed distribution to be the most valuable of its kind that has ever been gratuitously offered by any journal, and to introduce the above v uable plants to the homes of farmers and horticulturists in every part of our country.

An Extended Popularity.—Each year finds *"Brown's Bronchial Troches"* in new localities, in various parts of the world. For relieving Coughs, Colds and Throat diseases, the Troches have been *proved* reliable.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 1, 1879.

BEANS AND PEAS.—Heavy arrivals and no improvement in the demand have weakened quotations for marrows. Choice grades of mediums are not plenty and they hold up; under grades are freely offered at buyer-favored prices. Neither pea beans nor white kidneys have a steady place and prices are off. Red kidneys are in excess of the demand, again quoted lower. Black or turtle soup beans have merely a retail call. Green peas at station, $1.30; in store, $1.32½. Canadian field peas quiet, but steady at 73@75c., bulk and bond. Southern B. E. peas firmer, $2.70@2.75; Medium beans, prime, $1.35@1.37½; fair to good, $1.20@1.30; marrows, prime, free on ship, $1.40@1.42½; fair to good, $1.25@1.35; pea, $1.20@1.30; white kidney, $1.40@1.85; red do., choice, $2.60; fair to good, $2.35@2.45; black beans, $2.00@2.25.

Receipts of beans for week, 7,850 bushels; exports, 514 pkgs.

BROOM CORN.—There is but little short corn offering, but otherwise there are fair supplies and an effort to sell, which gives easy prices. Brush and short broom choice, per lb., 5@5½c; do., common to good, 3½@4½c.; hurl, good to choice, 3½@4½c.; do., common to fair, 3@3½c.; red and crooked, 2@3c.

BEESWAX.—A light business at 26½@27c. Exports 2,550 lbs.

BUTTER.—The local trade continues to be of light volume; in State, however, there is this encouraging feature to be noted; buyers recognize the merits of stock offered at 16@20c., especially as there are four or five cents difference against them when they call for next and above grades. Bargains in firkins, Welsh and some summer lines of half tubs have brought out numerous Eastern buyers. Shippers are also availing themselves of this point and exportation promises to be liberal for a time. In short, although business has not struck the winter form that holders would desire, there is a freshness pervading the market that may easily turn into a rapid movement. Receipts are heavy, as large quantities now come forward on commission. This fact has weakened dairy rates. Western butter is quoted about as before, but with the competition of useful grades of State, inside figures are mostly quotable. In creamery the demand seems to be about equally divided; heretofore Western has led the cold weather call. Western butter has largely arrived frozen and as there is some risk in the thawing of some far western marks, buyers of cheap grades have felt safer in operating in stored State rolls firm for fancy to good fresh.

Single extra State half tubs, 26@27c.; State, full dairies, special, 25c.; other, 16@18c.; firkin dairies, fair to prime, 15@18c.; Welsh dairies, fine full, 16@17c.; choice half tubs, 23@25c.; fair to prime do., 16@21c.; choice Welsh, 19@21c.; fair to prime, 13@17c.; Choice creamery 25@26c.; best western creamery, 30c.; other, 24@28c.; early packed creamery, 17@20c.; poor State, 9@12c.; Western dairy, fine fresh, 15@20c.; fair to good, 10@15c.; factory, ladle packed, 15@19c.; good, 14@16c.; other, 7@9c.; rolls, 10@18c.; grease, 4@5c.

Receipts for week, 37,000 pkgs.; exports since Jan. 18 equal to 19,000 firkins; same time 1878, 3,400 do.

CHEESE.—The exports this week have reached 48,144 boxes; in connection with the home trade, the movement has been quite satisfactory. The feeling among holders is to let supplies go promptly at current figures in order to get the pretty full general stock worked down as close as possible; the only grade excepted from this is strictly fancy, which is in reduced assortment, and is occasionally running above quotations.

Quotations are 9@9¾c. for strictly fancy; 8¼@8½c. for fine lots; 7½@8c. for good; 4@5c. for skimmed; State, farm dairy at 8@8¼c. for fine; 7@7½c. for good to prime. Wisconsin factory, fine, 8½@9c.; do. good to prime, 7½@8¼c. Western factory, fine and fancy 8@8¼c.; good and prime, 6¾@7½c.; do. full skimmed, 2@5c.

Liverpool cable 46s.

Steam to Liverpool, 40@45s.

COTTON.—There has been a somewhat freer export movement, with a variable market, closing steady at, for February, 9.45@9.46c.; March, 9.64c.; April, 9.81c.; May, 9.96@9.97c.; June, 10.10@10.11.; July, 10.20@10.22c.; August, 10.29@10.31c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*N. Orleans.*	*Texas,*

STAINED.

Good ordinary	7¾	Low Middling	8¾
Strict good ordinary	8¾	Middling	9¾

FEED.—Quoted at $14.50@15.50 for 40 lbs.; $14@14.50 for 60 lbs.; $15.50@17 for 100 lbs., and $14@15 for rye feed.

DRIED FRUITS.—In apples there is a steady movement for export, the Ohio quarters taken at 2¾@3¾; sliced lots have more local demand. Raspberries are stronger, being scarce; other small fruits are held steady.

Southern plums nominal; State plums, 14@14½c.; Blackberries are quoted at 5c. Peaches—Peeled Georgia, at 6@7c. for poor; 8@9c. for fair to good; 10@10½c. for prime; choice North Carolina, 11½@12½c.; good do., 9@10c.; unpeeled halves, 3c.; quarters, 2c. Pitted cherries, 21c. Apples—New, 2@2½c. for southern quarters in bags.; 3¼@3½c. for good and prime sliced; do., fair at 2¾@3c. State at 3@3½c. for new sliced; and 3@3½c. for quarters; Western at 2¾@3¼c. for new quarters. Raspberries, 28c. Apples, evaported, Alden or Williams, at 9¾@10¾c.; other processes at 6@8c.

Exports, past week, 763 bbls. apples.

EGGS.—Receipts for the week, 3,215 bbls.; do., last week, 3,256 do. There are light averages for New York supplies, but the market will not stand pressed prices. When rates for fresh have been put above the annexed buyers have suddenly withdrawn. Limed doing well. Market for all prime steady at the close. Near points, fresh, 31@32c.; State, Western and Southern 29c.; poor Western, 24@25c.; Canada, 25@26c.; choice limed, 23c.; good, 21@22c.; inferior, 18@19c.

ESSENTIAL OILS—Prices are easy as no export demand now supports trade. Stocks of American oils abroad said to be very large. Latest quotations, first hands: peppermint, glass (Hotchkiss), $2.30; in tin, $1.50; wintergreen, $2; sassafras, 43c; pennyroyal, $1.25; spearmint, $3.25; wormwood, $3.

FLOUR.—There is more of a movement for export, and low grade stock generally is at stronger prices. The higher grades are having more attention, and rule steady.

Latest prices are at $3.15@3.60 for very inferior to strictly choice superfine State; $3.60@3.90 for very poor to good extra do., odd lots and lines; $3.90@4.25 for good to very choice do., and fancy lots above this; $3.10@3.60 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.60@3.90 for inferior to good shipping extra do. and $3.90@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.00@5.00; choice to fancy do. at $5.00@5.75; red and amber winter wheat, very inferior to very choice trade and family, at $3.90@5.60; round hoop Ohio at $3.85@4.25, and trade and family brands of do. at $4.25@5.00, the latter rate for very choice; St. Louis, $4.00@4.75 for very poor to good extra, and $4.75@5.60 for good to choice; Minnesota clear, very inferior to fancy, at $3.60@5.00; few brands going above $4.50; Minnesota "straight," inferior to fancy at $4.40@5.60; and patent fair to strictly fancy at $5.25@8.25, few brands going above $7.50; unsound stock at from $2.00@4.75; city mill extra at $4.70@5.00 for West Indies (the latter rate for fancy in new packages); do. for England $3.65@3.80; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.50 for fair to very choice; No. 2 at $2.35@3.00 for poor to very fancy.

BUCKWHEAT FLOUR quoted at $1.70@2, with most of the sales at $2.50.

CORN MEAL.—Sales at $2.80 for Brandywine and $2.25@2.75 for yellow Western.

FRESH FRUITS.—The apple market has developed into a strong position; all good to prime have a fair demand at the extreme. Off qualities very slow. Exports for week, 2,243 bbls. Spitzenbergs, choice, $2.25@2.50; poor to fair, $1.37@2; prime Baldwins and Greenings, $1.75@2; Spys and sweet, $1.25@1.50; demand small for latter sorts; frosted or specked, $1@1.12. Cranberries are in moderate demand only, but prices hold up for choice, hard, high-colored fruit, as a fair share of using season remains. Fancy Cape Cod, $9; prime, $7.50@8.50; common to good, $5@7; N. J. crates, $3, selected; prime, $2.75; other, $2@2.50. Florida oranges dull; foreign are showier than the bulk of domestic and draw off trade; half-bbl. boxes, $1.75@3.50; some poor enough to quote at $1@1.25; bbls., $5@7. Hot-house strawberries, $5 per quart. There is not much doing in peanuts, but choice Va. are held with some firmness, at $1.10@1.15; good to prime, 30@95c; a free offering of the latter grades; shelled, 4@5c. Pecans, 7¼@9c. Hickory nuts dull at $1.50@2 for Shellbarks.

FURS AND SKINS.—Leipsic sales did not turn out as favorable as that of London, and common skins here have lost in a week more than they gained by the London buoyancy. Skunk show the most marked decline. Collection here heavy.

GRAIN.—There are reports at the close of a freer inland movement of supplies, and the markets here for all articles have eased off a little. Export purchasers of wheat and corn are somewhat freer, but there is marked vigor to the business, the cables from the other side representing quiet and tame markets.

Latest sales of wheat are of No. 2 Milwaukee spring, at $1 02 for strictly prime; ungraded amber at $1.06@1.07½; No. 2 amber, store and afloat, at $1.06@1 07¼; ungraded red at $1.01@1.07; No. 1 red at $1.09@1.09½; No. 2 red at $1.09@1.09½; do., steamer quality, at $1 06; No. 3 red at $1.04@1.05; extra white at $1.10¼@1.10¾; white State at $1.09½@1.10; No. 1 white at $1.09¾@1.09¾; No. 2 white at $1.07@1.07½; ungraded white at $1.07@1.09; No. 2 amber, February option, at 1.07¾; do., March option, at $1.08¾; No. 2 red, January option, at $1.09; do., February option, at $1.09@1.09¾; do., March option, at $1.10¼. Rye at 58@59 for No. 2 Western and 56@60 for State, the lower price for car lots. Corn, steamer mixed, in lots, at 45½@45¾c.; New York No. 2 afloat at 48@48¼c.; prime do. in store at 47@47½c.; New York No. 3 at 43¾@44c.; ungraded mixed at 47@48¼c.; New York No. 2 new at 46@46¼c.; Jersey yellow at 46¾c.; New York yellow at 47¼c.; yellow southern in car lots at 45@46c.; New York steamer yellow at 46¼c.; New York No. 2, February option, at 45¾c.; do. March, at 46¼c.; steamer mixed, February option, at 44¼c.; do., March, at 44¾c. Oats at for New York No. 1 quoted 31¼c.; New York No. 2 at 30¾@31c; New York No 2 white at 32¾@33c.; do., February, option, at 3 ¾c.; New York No. 3 at 30c.; New York No. 3 white at 31¾@32c.; white Western at 32¾@33c.; mixed do. at 30¾@31c.; white State at 33@34¼c.; mixed do. at 31¾@32c.; New York extra white at 33@33¾c.; New York No. 1 white at 34¼c.; No. 2 Chicago, afloat, quoted at 31¾c. Barley lower. State 6-rowed, 85@90c.; do, 2-rowed, 75@78c.; Canadian, 90c.@1.15; malt unchanged.

HAY AND STRAW.—There is a good call for prime hay and long rye straw, which rule in favor of holders. General receipts are larger, which presents decided strength otherwise.

Sales at 40@45c. for shipping, and 70@80c. for retail qualities. Straw quoted at 50@60c. for long rye, and 40@45c. for short rye, and oat at 40@45c.

Exports, for week, 1,900 bales.

HONEY.—Holders strive hard to place the burdensome surplus, but the low prices do not seem to aid their efforts. Single comb clover, 10@12c.; two do., 8@10c.; buckwheat and dark, 7@9c.; strained, 6@9c.

HOPS.—Exports for the week, 1,119 bales; these are partly through shipments; the market, as a rule, has rather a quiet look, and there are but few lots good enough to exceed 13. Shippers want strictly choice stock, and this being in very moderate supply accounts partly for the tame feeling.

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 10@12; New Yorks, new crop, low to fair, 7@9; Eastern, 8@12; Western, 8@12; Yearlings, 4@6; Olds, all growths, 2@3; Pacific coast, 12@15.

LEATHER.—Quotations are 18@20c. for light hemlock; 19@21c. for middle do.; 19@21c. for heavy, and 17@19c. for good damaged.

OIL CAKE.—Western moves but slowly, and is offered at $27 per ton.

PROVISIONS.—Hog products have been very much excited, violent fluctuations, and closed weak, through speculative manipulation. Mess Pork closed at $8.20 bid and $8.50 asked for old for February; $10.15 bid and $10.35 asked for new for February; $8.30 bid and $8.50 asked for old for March; and $10.15 bid and $10.35 asked for new for March, and $10 15 bid and $10.35 asked for new for April, and May at $10.25@10.40. Bacon at 5c. for long clear and 5c. for short clear. Lard at $6 60 for spot lots; $6 57½@6.60 for February $6.67½ for March, $6.77½ for April, and $6.85 for May. Stearine at 6¾c. for prime. Tallow at 6¾@6¾c. for fair to prime. Beef hams at $16@16.50. Beef, extra India mess, $18@20 as to brand; packet at $11@11.50; plain mess at $10@10.50; extra mess at $10.50@11.50.

POULTRY AND GAME.—Live stock has continued scarce, and quotations for fowls have nearly equaled best dressed; hen turkeys also doing well. Ducks and geese firmer.

Fowls, N. J., 12@13c.; Western, 11@12c.; Roosters, old, 5@6c.; young, 7@9c.; turkeys, hens, 11@12c.; toms, 9@10c.; ducks, 60c.@$1 pair; N. J. geese, $1.75@2; other, $1.25@1.75; pigeons, 30@35c.

With only an ordinary demand, dealers have as much as they can do to keep prices up to former ranges for any kind of dressed. A good deal of coarse stock is showing, and to fill fancy wants buyers have frequently resorted to city killers. Heavy turkeys are not wanted. Prime scalded stock sells about as well as dry-picked, unless the latter is from special near points.

Phila., dry-picked turkeys, 12@13c.; fresh New Jersey, 11½@13c.; selected Western, 10¾@11½c.; other, 8@9c.; Phila. fowls, 9@11c.; do. chicks, 12@13c.; nearby fresh, 11@12½c.; other, including frozen, 6@9c.; Capons, 18@20c.; slips, 15@17c.; Ducks, 9@13c.; Geese, 6@9c.

The market has been supplied so long with cheap game that consumers have had a surfeit, and dealers have still to quote low figures for even moderate supplies of many items. The weather, too, is becoming treacherous for holding, while the export outlet, which has helped diminish the surplus, is now reduced.

Quail, ₱ doz., prime, 60@75c.; soft, 45@50c.; Grouse, trapped, ₱ pair, 55@60c; soft, 40@50c.; Partridges, ₱ pair, 80c.@$1.10; Canvas-back Ducks, $1@1.25; Redhead, 50@75c.; Mallard, 40@50c.; Black and Teal, 25@30c.; common, including Broad-bills, 15@20c.; Hares, 22@25c.; Rabbits, 14@18c.

RICE.—Sales at 5¾@6¼ for Carolina, fair to good quality; and 6¾@7¾ for prime to choice do.

SALT.—Higgins' quoted at $2 40, Ashton's at $2.50, and other brands at $1 10@1 15.

SEEDS.—Lighter arrivals has tended to better prices for clover, which is now 6¾@6¾ for prime, and 6¾@6¾ for choice. Timothy at $1.20@1.25.

SUGAR.—Refined at 9⅛@9¼ for cut loof; 9@9⅛ for crushed; 8¾@9 for powdered; 8⅝@8¾ for granulated; 7⅝@8¼ for soft white and 6@7¼ for soft yellow.

TEAS.—Quotations are for Hyson, 18@22c. for common to fair, 25@33c. for superior to fine, and 35@40c. for extra fine. Young Hyson at 18@21c. for common to fair, and 25@45c. for better qualities. Gunpowder at 16@23c. for common to fair, and 30@50c. for higher grades. Oolong at 18@23c. for common to fair, 26@33c. for superior to fine, and 35@45c. for extra fine to choicest.

TOBACCO.—The home trade demand for seedleaf is quite fair, but Kentucky leaf moves but very moderately; prices generally steady.

VEGETABLES.—Potatoes that have been kept back by cold weather are now coming in and the rush making a temporary over-supply and prices bend a little under it. Bermuda potatoes have sold at $3 per bbl.; do., tomatoes, 75c. box; Nassau do., 50@75., do.; Onions very firm. Squash slow; extra large, however, not as saleable as medium sizes. Lima beans, shelled bring good prices.

Nova Scotia E. Rose, bulk, or 175 lbs. to bbl., $2.75@3.10 per bbl.; Prolific and Chili red, $2.12@2.50; P. E. I. Jackson whites, $2.12@2.37; Mercers, $2@2.25; Eastern E. Rose, with bbl., $2.87@3.00; State, $2.50@2 75; fair to good, $2@2.37; do. Peach Blow, choice, $2 87@3.00; common, $2.25@2.50; Peerless, choice, $2.12@2.37; poor to good, $2@2.12. Sweet potatoes, Del., kiln-dried, $2 40; other, $2@2.25; Onions, White, $2.50@3; red and yellow, $2.25@2.50; Chester, $2@2.25. Hubbard and marrow squash, $2; Cabbage, $5@7 per 100. Cauliflower, bbl., $1.50@3. R. Turnips, 75@87c. Beets, 75c. Carrots, 75c.@$1. Celery, 6@75c. doz. Extras; hot-house Radishes, $4 ₱ 100 bunches; Cucumbers, $4@4.50 doz.; Mushrooms, 40@50c. ₱ lb. Lettuce, 50c.@$1

Exports, potatoes, past week, 1,700 bbls.; onions, 175 do.

WOOL.—There is a more active movement on wants of manufacturers and a generally firm market. Quotations are for

Ohio, Pennsylvania and Virginia—XXX and picklock, 37@39c.; XX, 34@35c.; X, 33@34c.; No. 1, 35@36c.; No. 2, 30@32c.; common, 28@30c.; combing and delaine, 33@33c.

New York, Michigan, Indiana and Wisconsin—XX, 31@32c.; X, 31@32c.; No. 1, 33@35c.; No. 2, 29@30c.; common, 27@28c.; combing and delaine, 34@37c.

Iowa, Vermont and Illinois—X and XX, 28@31c.; No. 1, 32@34c.; No. 2, 27@29c.; combing, 33@36c.

Missouri, Kentucky and Tennessee—Washed fleece, 26@31c; unwashed fleece, 21@25c.; unwashed combing, 23@27c.

LIVE STOCK MARKETS

Saturday, Feb. 1, 1879.

BEEVES.—Receipts for the week, 10,137 head; do., last week, 9,500 do. The market has been thrown into considerable excitement owing to the report of the stoppage of importation of American cattle into England. Up to yesterday no telegrams were received by shippers confirming the report, but it is currently believed that the British Government will, for a time, prevent the landing of live bullocks from this country. It seems that reports of alarming prevalence of pleuro-pneumonia on this continent has gained credence in cattle raising districts abroad, and the prompt precautionary action of the English Government is excusable. When the facts of the general condition of cattle here become settled, dealers look for a resumption of the growing business of export. There are some who assert that jealousy of competition has prevailed in influencial circles across the water; of this, however, we cannot speak. Certain it is our English cousins must be hard to suit if the style of stock they have been in receipt of fails to satisfy them; in almost every instance of the past year, or longer, the cream of our stock yards has been sent on board steamers. Trade has dragged during the week, prices at the at the close ranging 8@10c. to dress 55@56 lbs. Seven car-loads of fat cattle have been exported since the semi-official interdiction. Chicago dressed beef, 4½@5½c.

COWS AND CALVES.—There is no trade here that can be termed a market. Cows of real value that are sent in to be realized on are just as apt to be taken back to the country. Nominal quotations, $35@45, but a cow that has lasting dairy merits is really worth more than it would bring here inside of the range of prices.

VEAL CALVES.—There has been a steady trade for prime live or dressed; the exceptional extreme quoted last week has been general for top grades of live most of the week. Small hog dressed are quoted ½c. better for best. Live calves, N. J. and Buck's Co., 7@7½c.; choice State do., 7c. other, including heavy weight, 5½@6¾c.; fed, 4@5c.; grassers, 2½@2¾c. N. J. and Buck's Co. hog dressed, best, 10c.; prime, 9½c.; other, 6@8½c.

SHEEP AND LAMBS.—Receipts for the week, 17,639 head; do. last week, 13,496 do. A brisk trade has favored sellers and the pens have been fairly cleared of both sheep and lambs. Western sheep, 5¾@5¾c.; N. J. and other, 5@5½c.; ewes, 4½@5¼c. Lambs, 5¾@6¾c.

SWINE.—Receipts for the week, 24,766 head; do., last week, 35,960 do. Good live corn hogs in good demand with sales at $3.90@4.20 per 100; poor Illinois sold at $3.57½ per 100.

N. J. dressed pork better; light, 5¾@5¾c.; medium, 5¾@5½c.; heavy, 4¾@5c.; city dressed, 5@5¾c.; Western, 4¾@4¾c. Pork tenderloins, 6@6½c.

HORSFORD'S Bread Preparation

UNSURPASSED FOR MAKING

LIGHT BREAD

Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

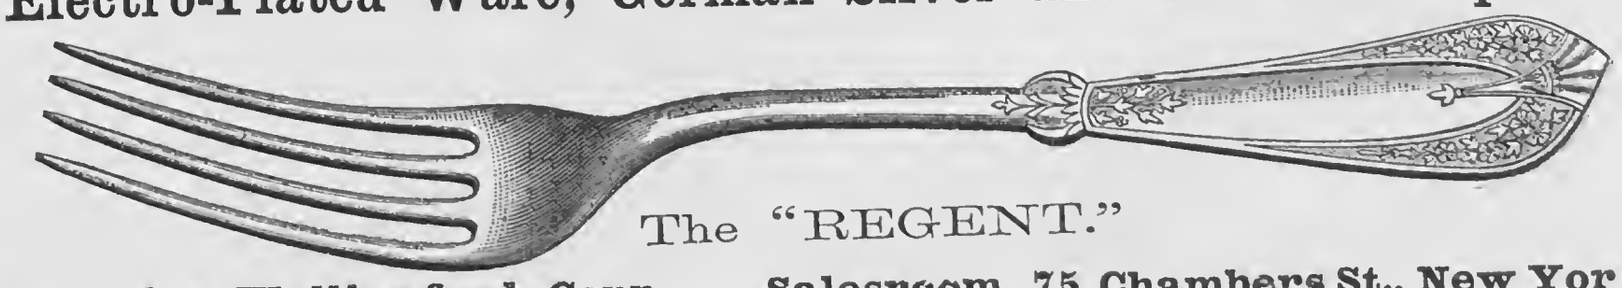
Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the direotions of Prof. E. N. Horsford, by the Rumford Chemical Works Providonce R. I.

HALL, ELTON & CO.,

Electro-Plated Ware, German Silver and Britannia Spoons.



The "REGENT."

Factories, Wallingford, Conn. **Salesroom, 75 Chambers St., New Yor k.**

Reading for the Young.

BUY MY PRETTY FLOWERS.

COME, kind people, what's your pleasure?
Do not pass my posies by;
Gathered from a fairy's treasure,
Fresh and lovely, here they lie,
Scented from sweet Nature's still,
Fragrant after morning dew.
Come, then, choose ye where ye will—
Here are some of ev'ry hue.

Here a lily bud is peeping,
Here a violet of blue,
Here a pansy, thoughtful keeping,
Gay and merry daisies too;
Here a graceful fern is bending
Low to kiss a blushing rose;
Mignonnette's sweet odor blending,
While rich beauties all disclose.

Dahlias curling, fuschias drooping,
Bright geraniums, heather-bell,
Wild vines, with their tendrils looping
Round sweet-briar, look so well.
All my blossoms tell the story,
How the earth, so beauteous clad,
Decked with gems, arrayed in glory,
Welcomes Summer gay and glad.

Come then, stay and buy a posy
Brought from garden, meadow, dell,
Gathered while you all were warmly
Wrapped in slumber's soothing spell.
Up betimes, no thought for resting,
Out the flower-girl must stray,
To and fro with eager questing
For the posies here to-day.

Buy my pretty, pretty flowers—
Choose ye as they lovely lie,
Wet with dew or morning showers;
Take a penny bunch—please buy!

PRESERVE THE INDIAN RELICS.

A LETTER FROM F. E. ASPINWALL M. D.

Jan., 23, 1879.

EDS. RURAL NEW-YORKER:—I see by a late number of the RURAL that at least one of your young correspondents is "trying to make a collection of Indian relics, arrow-heads, stone axes, &c." That is a good idea. I only wish many more would do likewise, and preserve carefully every stone implement they find. Having had nearly fifteen years' experience in collecting, I will, with your permission, offer a few thoughts and hints to your younger readers and others who may be interested in ancient implements.

I commenced collecting when a mere boy, my principal object being then to get a collection of pretty and odd specimens; but like most young people who have no one to advise them I made many mistakes, and had to learn wisdom by expensive experience.

I foolishly threw away many of the ruder and more imperfect specimens, many of which, from a scientific point of view, were just as valuable as the more perfect specimens, and several specimens, that I thought were not shaped just right, I tried to improve and thus nearly or quite ruined them. It should be remembered that the rude and imperfect and even the broken specimens, are just as necessary in the study of the archæology of any district as are the perfect specimens. Even the blocks and chips of flint, chert, jasper, quartz, &c., are interesting to the earnest student. The way the implements are broken, and the proportion of broken specimens of each class, are often clues to their uses; and the rude, unfinished specimens and the blocks of "raw material" and chips or flakes of the same, often give hints as to the methods of manufacture.

One very important thing for collectors to do is to keep a careful record, in a book for the purpose, of where, in what position, and under what circumstances each specimen was found. The date of finding may also be of interest. Whether found on the surface, or under the stump of an old tree, or far beneath the surface imbedded in the "drift" of many centuries ago, are often important hints as to their approximate ages. And whether found near the edge of large bodies of water, or in valleys near small streams, or on hills, or far back from water are all important hints as to the uses of the various implements. The proportion of each kind from each locality often indicates their uses. A good way to keep the record is to number and describe in your book each locality, and give each specimen the same number as the locality in which it was found; or each specimen can be numbered as obtained and recorded in rotation. I prefer the former method.

Another very important matter to collectors is to take good care of their specimens. Yet very few do. The inexperienced do not realize how easily flint implements, especially the more delicate forms, are broken, and other stone implements defaced if not broken. It will not do to keep them in contact with one another in a box. They will thus be liable to frequent and serious injuries. The delicate points, barbs and other parts on which their value often largely depends cannot be preserved in that way. Unless you have some good and safe way of displaying them you had better keep each specimen wrapped up in a separate piece of paper, and all stowed carefully in a box or boxes for the purpose. And be careful in wrapping them, also in handling them, for one, falling on a hard substance, is very likely to break. Also do not "strike fire" with your "flints" just to see the "sparks fly," that would utterly ruin them. In short, take the best of care of all the specimens that you find, or that may chance to fall into your hands, and if you do not wish to keep them yourself, present them to some scientific institution or museum where they will be appreciated and preserved, and your name will be recorded as the donor.

Stone implements are fast becoming scarce in the U. S. especially in the settled portions. Thousands of specimens are being annually broken by the various implements of agriculture, and many more by children and others who happen to find them or otherwise get possession of them, yet do not appreciate their value.

Farmers have excellent opportunities for making collections and should improve them. They should aid the few struggling institutions that make a specialty of antiquities, by contributions of such specimens as they are willing to part with. And all should remember that "private collections" are very apt to be sooner or later scattered and thus lost to the world, and should act accordingly.

These ancient stone implements are of historical interest, and serve to indicate, in some degree, the condition and progress of man in prehistoric times.

THE FARMERS OF THE FUTURE.

M. OAKEY.

WHO are to be the farmers of the future? Where are those who will occupy the old homesteads? Who shall be the best farmer "in our neighborhood?" By far the largest portion of the future farmers are already on the homestead. The young men and boys living on their father's farms are the candidates for the worthy position of "best farmer." Some one among them will outrank all others. Why? Because he was born so? No! not by any means. Simply because he will *make* himself the best. Young men who desire to stand well among their fellows, or who are ambitious to stand above them, have the encouraging fact to spur them on to attain such a position, and to bear always in mind, that there are no farmer geniuses born to the position. The highest rank awaits any one who will grasp the prize; and who shall succeed in acquiring it, depends solely upon the efforts made by each. Furthermore, the actual position each will assume, will be proportionate to the energy and perseverance put forth.

Now, those two words, energy and perseverance, need not scare any one. They don't mean overworking oneself and complete exhaustion. On the contrary, they prevent any such suicidal practice, or wasteful habit. One's strength and powers must be held under control—husbanded, and a check administered now and then, or else "energy," or otherwise "perseverance," will not be able to hold out. They exclude frantic and spasmodic exertions which do not promote advancement, but, on the contrary, very greatly retard it.

How shall these two qualities be applied to make successful farmers of the boys and young men? Well, if you have not begun the application already, start at once. Lay the foundation now. And let that foundation be *thought*. Keep one word always in the front and on the right and left, above and below you, until your whole expression and personality shall indicate it. That word is—*Why?* You are sent to plow a field a certain way—think, "Why?" You harrow it once. It is not enough. You are sent the second, and even a third time over it. Think, "Why?" You cultivate a crop first one way, then another—"Why?" The cattle must be regularly watered; your father says: "You attend to it." Think while doing it—"Why?" The feed must be changed. "Why?" The plow must be sharpened. "Why?" In short, while cultivating your father's field, cultivate the field of thought in your own mind. Do not ask "Why?" think "Why?" Solve for your own self each problem as it appears, and it may occur that you will be able to answer "why" to many difficulties that confront and confuse older heads around you.

First, then, lay the foundation of your future success upon a deep and broad "Why?" Do not be mere machines to perform the routine only of the work assigned you.

LETTERS FROM BOYS AND GIRLS.

DEAR UNCLE TRUE:—I have read so many of your good tales in the RURAL that I thought I would like to be one of your cousins, if you will be so kind as to accept me. I am a small boy, and was born in Honolulu, on the Sandwich Islands. My father and mother have been dead many years. I have lived with Aunty Dunlap for six years, who, I believe, has done her best to make a good boy of me; and I think she has succeeded pretty well, although Aunty's Uncle Mason, Miss Georgia and Sister Alice, all say that the picture in the RURAL of January 18, was intended for me. I am what you might call a live boy, and I glory in it; for I do despise a boy that has never been waked up. Indeed, Uncle True, I have seen some old men and women that have slept all their lives, but I am not going to be one of that class of people. They tell me I can't be President because I was not born in the U. S.; but I will try to be just as good a man as the President. Aunty makes me say my prayers before going to bed every night, and I go to Sunday-School twice every Sunday. I don't swear or use any bad language; therefore, don't you think I am a good boy, Uncle True? You were a little boy once, did you think it any harm to walk on your hands, or tie a string of Jackson Crackers to an ordinary dog's tail? I have been too long in my introduction to you; excuse JAMES CALDWELL.

West Va.

DEAR RURAL COUSINS.—The sun is now going down in a bank of swarthy western clouds across the large grain fields of my native home. All the day the sky has threatened storm. Here and there, through broken and gusty rifts, flashed out a bar of tan-colored flame, streaked with other bars of angry scarlet, like the dabbling of some bloody fingers upon the horizon. A raw wind is blowing from the west, that tries hard to entangle the stout old ivy which now commences tapping on my window as if for aid. I have just read the last number of the RURAL, and cannot help noticing the many improvements made in it since I last saw it, for I regret to say, that I have been one whole year without the RURAL; but with the new year I resolved never to be without it again, and signed for it at once.

The RURAL is a paper that should be read in every family circle. I am sorry to see that the young folks take so little interest in the Youth's Department. Many thanks to RURAL Lover for her sympathy, it is uncalled for. She is entirely wrong when she states that those whimsical daughters of Eve have successfully driven all the boys from the field. The boys take it, as I imagine that Moses of old would have done. I hope to see more of my old cousin's letters appear in the next issue, and especially should I like to see such excellent effusions as Nemo's and Hayseed's as well as those from my Pennsylvania friend, Fern. Now I will close so as to leave room for you, dear cousins all. *Adieu.* IVY.

Ivy's Rest, N. Y.

The Puzzler.

HIDDEN COUNTIES OF NEW YORK.

1. GIVE it to me, De Kalb, any how.
2. Her escort landed in New York.
3. Where is the club-room, Eva?
4. Which way, Nellie?
5. For lean suet is impossible.
6. Feed Tom on roes of the shad.
7. Yes, sextons are responsible.
8. Go range through the wildwood!
9. Don't a riot terrify you?
10. Put names of ladies first.
11. Frank Lincoln is at home now.
12. A graduate of Yale wishes to go.
13. The King saw his mistake.
14. The Earl gave livings to nearly a dozen young ministers.
15. They ate some peaches.
16. I lost the hat Jo gave me.
17. He said 'twas Dutch, Essie.
18. 'Twas cat-tar Augustus used.
19. It is awful to novices.
20. Casper, I entreat you to remain.
21. Among them were Blanche, Nan, Godfrey and Ben.
22. Do you see the wrens, Sela, Ernest shot?
23. The barque enswamped.
24. Mr. Shork, I merrily sung a lay.
25. A letter from Adi's, on pink note paper.

☞ Answer in two weeks. LITTLE ONE.

BIBLICAL ENIGMA.

I AM composed of 63 letters:
My 13, 37, 14, 23, 25 the first High Priest.
My 45, 63, 60, 50, 1, 24, 57 a seaport in Pamphylia.
My 22, 42, 29, 9, 10 a small town of Lycaonia.
My 55, 13, 26, 46, 49 a bird mentioned in the Bible.
My 44, 12, 48, 28, 32, 58, 57, 43 a granddaughter of Herod the Great.
My 42, 2, 9, 9, 36, 33, 38 one of the names of an Apostle.
My 20, 16, 21, 15 a plant mentioned in the Bible.
My 44, 45, 9, 19, 48, 26, 34, 62, 61 a coat of mail.
My 27, 46, 4, 3, 2 a musical instrument mentioned in Daniel.
My 5, 30, 35, 49, 14, 13 a General slain by a woman.
My 38, 51, 37, 29, 48, 7, 11 a bird mentioned in the Bible.
My 6, 13, 8, 44, 37, 17 a Prophet in the time of David.
My 53, 57, 52, 60, 44, 56, 4, 1 Abraham was called the father of.
My 41, 30, 31, 22, 39, 54, 5 in the Ark built by my 59, 62, 57, 44, who was a preacher of my 14, 16, 26, 44, 60, 10, 7, 4, 5, 6, 12, 35, 38.

My whole may be found in the writings of my 51, 13, 4, 1.

☞ Answer in two weeks. J. M. BRAINERD.

ACROSTIC.

1. A short time. 2. A thick rope. 3. A short-lived insect. 4. A surgical instrument. 5. A piece of music. 6. A Mexican cattle raiser. 7. To delay. 8. Cheerfully. 9. To drink in. 10. A bird. 11. To droop. 12. The doctrine of the soul. 13. Musty and rank. 14. To swing. 15. Neighborhood. 16. Weak in mind. 17. Injury. 18. A glutton. Initials form a promise which, if we remembered in the hours of adversity, would clear away the darkest clouds.

☞ Answer in two weeks. MD.

TRIPLE ACROSTIC.

1. OBSCURITY. 2. A lady's name. 3. A polished surface to reflect light. 4. A man of the Bible. 5. A noon repose. 6. A man's name. 7. Total. 8. Wedded. Primals, centrals and finals form flowers.

☞ Answer in two weeks. DR.

PYRAMID PUZZLE.

1. A CONSONANT. 2. A Bible tribe. 3. A drink. 4. Parts of the human body. 5. A flower. 6. Places for trash. 7. Nearness in place. 8. Informally. Centrals form an animal.

☞ Answer in two weeks. BALTO.

NAME PUZZLE.

PLACE nine male names so as to form a tenth.

☞ Answer in two weeks MAY.

PUZZLER ANSWERS.—Jan. 25.

DECAPITATIONS.—1, Baden, Aden; 2, Olot, Lot; 3, Snow, Now; 4, Sado, Ado; 5, Aden, Den; 6, Oman, Man; 7, Iran, Ran; 8, Kopal, Opal; 9, Prone, Roine; 10, Kraw; Raw; 11, Howe, Owe; 12, Shark, Hark; 13, Java, Ava; 14, Tanna, Anna; 15, Drukes, Rakes; 16, Peel, Eel; 17, Athy, Thy; 18, Trim, Rim; 19, Mask, Ask; 20, Sark, Ark; 21, Islay, Slay; 22, Awe, Wo; 23, Yell, El; 23, Chester, Hester.

CROSS-WORD ENIGMA.—Lida Dodge.

Sabbath Reading.

FORGIVENESS "FOR CHRIST'S SAKE."

IF any one who is a Christian finds a difficulty in forgiveness, I am going to give him three words which will help him wonderfully. "*For Christ's sake.*" Cannot you forgive an offender on that ground? Ah, the girl has acted very shamefully, and you, her father, have said some strong things, but I beg you to forgive her for Christ's sake. It is true your son has behaved very wrongly, and you did in a fit of anger say a very stern thing, and denied him your house forever. I entreat you to eat your words up for Christ's sake. Sometimes when I have been pleading a case like this, the person I have been persuading has kindly said, "I will do it for you, sir." I have said, "I will thank you if you will do it at all, but I would rather you would have said you would do it for my Master, for what a blessed Master he has been to you! Do it for his sake."

Finally, I want to say to you all brethren, that, as brothers and sisters in Christ Jesus, if we are to forgive one another, there must be some other things which we ought to do. And the first is, do not let us provoke each other to offend. If I know that a man does not like a certain thing, I will not thrust it in his way. Do not say, "Well, but if he is short-tempered, I cannot help it; he should not be so ready to take offence. I cannot always be paying deference to his absurd sensitiveness." No; but, brother, your friend is very ready to take offence, and you know that he is; have respect, then, to his infirmity of temper, such as you would have if he were afflicted in body.

In the next place, do not make offences. Oftentimes a man has been offended at another for no reason at all. One person has said of another as he passed him in the street, "He will not even nod to me. He is too proud to own me, because I am a poor man." Now, that beloved friend who was thus blamed could not see much further than his hand, for he was short-sighted. Another has been censured for not hearing, though he was deaf, and another for not shaking hands when his arm was crippled. Do not imagine offences where they are not intended.

Next, do not take offences where they are intended. It is a splendid thing if you will not be offended. Nothing makes a man feel so small as when you accept what he intended for an insult as if it were a compliment, and thank him for it. Can you master yourself to that point? Remember, you have overcome everybody when you have so fully overcome your own spirit that you remain content with that which naturally would excite your wrath.

Then, if you must be offended, dear brother, do not exaggerate an offence. If there must be something wrong, let it be as little as you can. A blind eye is often the best eye a man can have, and a deaf ear is better by far than one which hears too much. "Also take no heed," says Solomon, "unto all words that are spoken, lest thou hear thy servant curse thee." Something you have done may irritate a servant, and he may make remarks which are unbecoming and impertinent. Don't hear what he is muttering. Keep out of hearing. He will be sorry to-morrow. What would *you* do if *your* Master picked you up for every word, and if he caught up every sentence that you uttered? How would you live at all if he reckoned sharply with you? No, dear friends, as you have to forgive one another, do not take offence, and when offence is given do not exaggerate it, and, if you can, do not even observe it.

Then, again, do not publish offences. There has been something very offensive said. What then? Do not repeat it. Better that you should let your heart break, than go up and down with a fire-brand in this fashion. If a brother has done wrong, why should you do wrong? You will be doing wrong if you publish his fault.

Above all, my brethren, and with this I close, never in any way, directly or indirectly, avenge yourselves. In all things bend, bow, yield, submit. Brother, the most splendid vengeance you can ever have is to do good to them that do you evil, and to speak well of them that speak ill of you. They will be ashamed to look at you; they will never hurt you again if they see that you cannot be provoked except it be to greater love and larger kindness. This ought to be the mark of Christians; not "I will have the law of you," or "I will avenge myself," but I will bear and forbear even to the end. "Vengeance is mine. I will repay it, saith the Lord." Do not take that into your hand which God says belongs to Him, but as He for Christ's sake has forgiven you, so also forgive all those who do you wrong. "How long am I to do that?" says one. "I would not mind doing it three or four times." There was one of old who would go the length of six or seven, but Jesus Christ said "unto seventy times seven." God help us to be patient to the end. This is the kind of doctrine which Christ Himself preached, and therefore, since He preached continually this love to our neighbor, and forgiveness of our enemies, we ought both to preach and to practise it. Go ye and believe in Him, and be imitators of Him, remembering that He forgave His murderers upon the cross whereon He wrought out our redemption. May His Spirit rest upon you evermore. Amen.—[*Extract from a sermon by C. H. Spurgeon.*

Is not the soul more than raiment, more than friends, more than life, yea, more than all? Then why do you not labor to enrich your soul? 'Twere better to have a rich soul under a threadbare coat, than a threadbare soul under a golden garment. If he be a monster among men, who makes liberal provisions for his servant or his slave, and starves his wife, what a monster is he who makes much provision for his baser part, but none for his nobler nature! Ah, friends, a slothful heart in the things of God is a very heavy judgment.

PERSONAL ITEMS.

A woman lecturer modestly advertises herself in Providence as a "child of nature, wearing the unmistakable crown of genius, and doing her share in the ever-appointed work of genius—the work of 'making the whole world akin.' She brings with her the electricity of the North—the brilliancy of the aurora borealis—and all who meet her are magnetized." She blows her own trumpet so well that the RURAL won't "puff" her name.

A story is told indicative of the coolness and nerve of the Prince of Wales. He was in company with Dr. Lyon Playfair watching a caldron of lead boiling at a white heat. The doctor told him that, for certain scientific reasons, he could put his hand into the seething metal with impunity. The Prince, on this assurance, plunged his hand in, and pulled out a portion of the molten lead. It is a singular scientific fact that when lead is at a certain high temperature the human hand can be put into it without danger, the natural moisture of the skin preserving it from harm.

Nellie Hayes, a Wisconsin girl, put on trousers and started through the deep snow to walk six miles for provisions, the family larder being empty. She soon became tired out, besides losing her way, and the cold was intense. A big Newfoundland dog which accompanied her was the means of saving her life. She scooped out a hollow in the snow, lay down in it, and made the warm dog lie on her, shifting him about so as to successfully cover the coldest parts of her body. In that way she passed a whole night, and was not very severely frostbitten. "With two or three more dogs," she says, "I would have got along very comfortably."

A noisy drunkard was arrested in Chestnut street, Philadelphia last Wednesday week. He was bareheaded, and his clothing was torn. In the police station, when asked his name and residence, he said: "Maguffin, and I live on the Grampian hills, and I want to get there soon, because I've got important business." He was put into a cell, where he died of heart disease, brought on by dissipation. Then he was recognized as Mark Bates the actor. Ten years ago he was regarded as one of the finest light comedians in this country, and was, most of the time, at the head of a traveling company; but latterly drunkenness unfitted him for acting.

Deacon Schorn, of Murfreesboro, Tenn. was an Odd Fellow in high standing, and an accomplished swindler. He inserted a false name in a lodge record of 1848, had the supposed member reinstated, in response to a fictitious request from Chicago, and finally obtained for him a membership in the Chicago Odd Fellows' Life Insurance Association, then he waited for the opportunity to profit by all this scheming, and it came in the Ashtabula railroad disaster. Schorn manufactured evidence that the mythical member was killed, and obtained $1,900 insurance money, which he was to turn over to the "bereaved family." The swindle was not suspected until an attempt to repeat it was detected.

Rev. W. F. Checkley, assistant minister of St. Paul's Episcopal Church, in Toronto, starved to death a few weeks ago. Though his pay was nominally $800 a year he received about $400. His family consisted of six children (one, the adult son, having lost both hands), two children of a dead brother, and an invalid sister. After Mr. Checkley's death it was ascertained that the large family had lived on bread for two years. During that long period of suffering meat had not been tasted in the household, yet the man was always so heroically cheerful and even jocular that his dear, pious friends didn't think it necessary to pay the beggarly wages they had agreed to allow him.. An ample fund will be raised for the widow and children, so that the father and husband's woeful death will do for his family what the labor of a pious life could not do.

Potato Valley, in eastern Utah, contains only twenty families, and these are almost isolated from the rest of the world. John Boynton and Washington Phipps were partners in a ranch until Boynton murdered Phipps. The highest court official in the valley was a Justice of the Peace, but he did not hesitate to preside over a trial of Boynton. There were only six jurors, owing to a scarcity of men in the neighborhood. Their small number, and the fact that several of them had witnessed the tragedy, helped them to agree quickly to a verdict of guilty. The Justice sentenced the prisoner to be hanged, and sent him away with a constable, to whom the execution of the sentence was intrusted. But the constable took Boynton to the county seat, where he is to have a more regular trial.

Implements and Machinery.

Peerless Right-hand CORN SHELLER

Shells and separates easily one bushel of ears a minute. One man feeds and operates. Wrought shaft and heavy balance wheel. It is the cheapest and best Corn Sheller in the market.

THE article chiefly sold at most fancy fairs—The visitor.

WHEN ought mariners to have fruit at sea? When they stem the currents.

WHAT order of merit would the Queen remind you of if she were in bad humor?—Victoria Cross.

A CURIOUS sign has been adopted at Cupar by a native baker proud of his knowledge of English, "European loafer" being printed in large letters over his door.

"You want a flogging—that's what you want," said a parent to an unruly son. "I know it, dad; but I'll try to get along without it," returned independent Hopeful.

WHEN Laplanders meet they rub noses; when Englishmen meet they bow; but when Jerseyman meets Jerseyman, they shake and smile and shake again.—*N. Y. Com. Advertiser.*

FOR WOOERS OF THEIR OWN DESTRUCTION.—A bashful young man applied to his village paper for information on the important subject, "How to win a woman's love."—The reply was, "Kiss the babies, caress the tomcat, and give strict attention to the old lady."

AN old colored preacher in Atlanta, Ga., was lecturing a youth of his fold about the sin of dancing, when the latter protested that the Bible plainly said, "There's a time to dance." "Yes; dar am a time to dance," said the dark divine; "and it's when a boy gets a whippin' for gwine to a ball."

IT was a colored preacher who said to his flock last Christmas Day: "We have a collection to make this morning, and for de glory of Heaben, whichever of you stole Mr. Jones' turkeys, don't put anything on the plate." One who was there says, "Every blessed niggah in de church came down with the rocks."

ONE of the highest compliments a man can receive is to hear a friend say to him, "The very sight of your pleasant face is enough to drive away the blues."—*Chrystal.* But the satisfaction with which one hears such speeches is marred by the anticipation of the remark that is almost certain to ensue—"By the way you haven't got two dollars that you," &c., &c. —*Boston Traveler.*

Quicken the Circulation.

Don't let the blood stagnate in your veins. You can prevent its doing so by increasing its volume and purity, by stimulating the digestive organs, and encouraging assimilation, with that matchless vitalizing agent, Hostetter's Stomach Bitters. People not afflicted with any organic or inorganic disease, grow wan and haggard simply because their blood is thin, watery, deficient in nourishing properties and so meager in quantity that the extremities are very imperfectly supplied with it, and the superficial circulation extremely feeble. Hence the bloodless appearance of the countenance. But when the Bitters are used to enrich and quicken the blood, the rosy hue of health returns to the cheek, the frame acquires substance as well as vigor, the appetite improves, and no digestive qualms interfere either with its gratification or the subsequent tranquility of the stomach.

THE CLIMBING HYDRANGEA. (Schizophragma Hydrangeoides.)

Horticultural.

THE CLIMBING HYDRANGEA.

Schizophragma Hydrangeoides.

(See first page.)

We are sorry that this plant must bear so formidable a botanical name. Siebold, as far as appears, was the first to describe the Climbing Hydrangea, and having discovered that the new plant had four or five cells in the ovary where the Hydrangea had only two, he felt himself obliged to place it under a new genus. So good an authority as Maximowicz calls it Hydrangea scandens, a name by which we should very much prefer to have it known were not the other by structure the legitimate one. The illustration given is a faithful copy of the Climbing Hydrangea's appearance as given in Siebold and Zuccarini's great "Flora Japonica." Seeing is believing, and having compared a dried specimen of the Climbing Hydrangea, sent out by Mr. Maximowicz to Mr. Leroy of Columbia College, we can testify that Siebold's picture is a correct representation of the actual plant.

Mr. J. W. Clarke, lately of the Massachusetts Agricultural College, speaks of it in a recent letter as follows: "The Schizophragma has leaves, when fully grown, about the size of those of the Hydrangea paniculata grandiflora, only much more glossy and finely veined, also much thicker. If there were no flowers it would be well worth growing for the foliage simply. The flower, examined singly, is not striking, but taken in a mass, as it grows about the trunks of trees, it is very fine. The flower somewhat resembles that of Viburnum lantanoides. If given good ground and not too much shaded, its growth is quite rapid."

The general character of the illustration presented, suggests much the same conclusions. Unquestionably, the foliage is fine, being ovate, almost round sometimes on the older growth, and more pointed and serrated on the young leaves, as shown on the piece of climbing stem in the illustration.

Here also, on this stem, are evident the numerous adventitious roots or rootlets which enable it to cling, like the Ivy or Ampelopsis Veitchii, to walls and slightly rough surfaces. We learn from Siebold and others that the Japanese value highly the Hydrangea scandens, and cultivate it in their gardens. The familiar name for the Climbing Hydrangea in Japan, is the Trailing Snow-Apple, Tsura Demari. When seen climbing over the front of dwellings in Japan, the effect is said to be very pleasing. In a wild state, as seen trailing over and around rocks and trees, its appearance is also described as charming. It is found growing after this fashion in the higher mountain valleys in Japan. The Japanese also grow it as a dwarf tree, about three feet high. Siebold speaks of a variety of the Hydrangea scandens, that bears reddish-colored flowers, which we should much like to see.

Pomological.

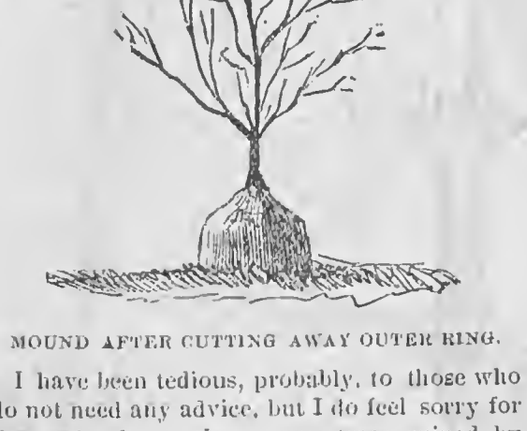
PROTECTING YOUNG TREES FROM RABBITS.

WHY SOME MOUNDS DO NOT PROTECT.

I was highly interested in General Noble's account of the treatment given those old trees. One reads so much that savors of profit only, in the management of fruit trees, that it is a treat indeed to an amateur whose object is not profit alone, to read of the General's surgery of those old trees, and as he promises more, we are in a hurry to hear it. Some apple trees have already been ruined by rabbits here this winter, and I propose to tell how I prevent their depredations. It is by mounding, of course. The Rural has objected to this method, but for want of a better preventive, and of suitable appliances on every farm for wrapping or encasing the lower part of the stems, we continue the use of the old plan hereabouts. In every agricultural paper I have ever read, I am accustomed to see many inquiries every winter about this matter, many claiming they have mounded their young trees to no purpose. Now, the trouble is they have not done the work right in two respects. The principle upon which the little mounds act as barriers, is as fixed as the habits and nature of the little animals against which the trees are to be protected. The rabbit will not climb, nor will the field mouse, to any considerable extent. Neither will the former leave the plane of its burrow coursing along just beneath the surface, to ascend into a mound; nor could it if it would, if the mounds are properly made. Well, it *might*, but it *does* not, since the mound is not only compact, but frozen through owing to its complete exposure. But all this many of us understand, still there are many who do not, if we may judge from the inquiries frequently made. Where mounds have failed, it must have been from one of two causes, or maybe on account of both, viz: the mound is not compact enough, containing trash, clods, etc., or its sides are too sloping, rendering it an easy matter for the animals to walk right up it. In nearly every instance I have noticed here, the mounds are too low and sloping.

HOW TO MAKE THEM.

I choose a time for making them when the soil is a little wet, *not muddy*, but waxy. I much prefer a day on which there is a slight freeze. I quarry out a square yard of the thinly frozen soil around the stem of the tree; the ground being slightly congealed on the surface, this is easily and rapidly done, and the operation removes away all weeds, grass and clods. The soil around the stem is then made very loose, after which I "firm" it by tramping, stamping, etc. Another portion of the upper soil is removed near the tree, which again disposes of all trash, and from this I get the soil to make my mound. This I start with a broad base, say two feet; I am careful to tramp down well every few spadefuls. In this way the mound is raised ten or twelve inches high, sloping steeply in the shape in which it is too frequently left.



MOUND AS TOO OFTEN LEFT.

I then take away the outer and lower part all around by plunging the spade in, perpendicularly, about six inches from the stem of the tree. This leaves a ball standing around the stem, the surplus soil being thrown aside. Next I "humble" myself, and with my hands mold this ball into a pointed or oval shape at the top, and pound it with my fist till it is very compact and smooth.

MOUND AFTER CUTTING AWAY OUTER RING.

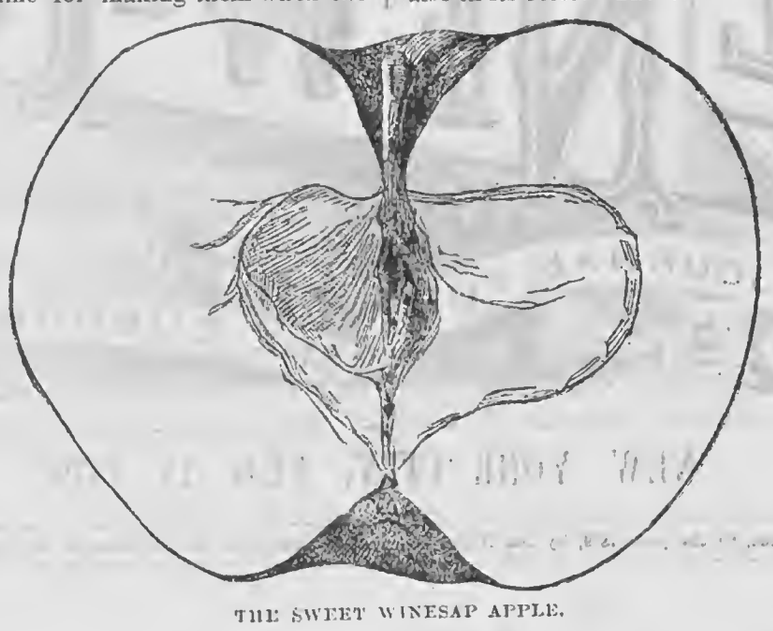
I have been tedious, probably, to those who do not need any advice, but I do feel sorry for those who have nice young trees ruined by "varmints." The aggregate loss in the West from this cause is enormous every winter. My object has been to give those help who think they have tried mounds in vain. Don't give up this plan; mounds fashioned in this way will "work." There's plenty of soil, and on many farms the materials for wrapping are not at hand. Remove all mounds in spring. If this advice will save one tree, either in this or any succeeding winter, I shall feel rewarded.

Dr. A. C. Williams.

Douglas Co., Ill.

THE SWEET WINESAP APPLE.

A short time since we received by express a dozen apples from friend Nelson Ritter, of Syracuse. They belonged to a variety purchased as the Ladies' Sweet, but were unlike others of that sort grown in that neighborhood. A couple of noted pomologists failed to recognize by the fruit to what variety specimens similar to those sent us actually belonged. Mr. Ritter says: "The tree is an upright grower—more so than the Northern Spy. The branches are very stocky, the bark is smooth both on branches and stem, resembling that of the Red Astrachan in this particular, as it does also in its color. The tree is a great bearer and the fruit keeps well through the winter. We pronounce the quality first-class. A good judge of fruit expresses the opinion that it is Bailey's Sweet."



THE SWEET WINESAP APPLE.

Having some doubts about the variety ourselves, we sent a specimen to Mr. Charles Downing, of Newburgh, and requested his opinion on the matter. He replies as follows: "It is the Sweet Winesap—Downing's 2d Revised Edition, page 378—with its several signs. It is a good winter apple. I have never been able to find out where it originated. The tree is a vigorous grower, upright, and forms a round head. It bears large crops on alternate years, and often light ones on intermediate years. Its season is from November to March, and it is considered a valuable and profitable Apple where known."

Farm Topics.

THE HISTORY OF A POOR FARM.

No. 4.

Artificial Fertilizers.

The supply of manure is the first consideration in the improvement of a poor farm. Notwithstanding the certain effectiveness of artificial fertilizers, and their convenience in handling and use, it is by no means advisable to trust entirely to them. There was never yet an old-established practice that was suddenly abolished and displaced by a new method, that was so complete an innovation upon old customs as the substitution of artificial fertilizers for barnyard manure; and it is not probable that any system of farming by the use of these alone will soon become prevalent. Yet they are invaluable as a help to increase the yield of our fields by assisting the effects of manure, or by stimulating early growth, and thus forwarding the plants' maturity. Another of their invaluable uses is to help to improve such a poor farm as this of mine, so as to make a beginning and lay the foundation of the often-repeated sequence, "more feed, more cattle; more cattle, more manure; more manure, more feed," and so on. Without the easily procured artificial fertilizers, the "more feed," with which one must start, would be impossible, and a poor farm must ever remain in a condition of hopeless sterility.

MOUND FINISHED.

"The first thing to be done in the course of improvement, is to procure manure; of that there is no doubt," said my old neighbor; "and for my part, I would choose stable manure before any other kind. My grandson, William, has been trying phosphate, bone-dust, and some other fertilizers, and is quite wild about them; but I have my own doubts. They may do very well to help a little and hurry up the crop, but they won't last like manure; at least it doesn't seem natural that 200 or 300 pounds of the stuff, sown over an acre of ground, can bring a ton of hay or 30 or 40 bushels of corn extra."

"Suppose you were to burn that ton of hay or corn, how much would be left of it?" asked Doctor Jones.

"Not much," replied the old gentleman. "When my barn full of hay burned up about 40 odd years ago, I remember there was a very small heap of ashes left, and there were five-and-twenty tons of hay at least in it. But what has that to do with it?"

"Only this, that every ounce of potash, phosphoric acid, lime and other minerals in those 200 or 300 pounds of fertilizer that go into the ton of hay, you would get back in the ashes; and the only part of the fertilizer you would lose, would be the ammonia or nitrogen. If I remember aright, a ton of hay contains 133 pounds of mineral matter, or ash, and this consists of 34 pounds of potash, 8½ pounds of soda, 6½ pounds of magnesia, 15½ pounds of lime, 8 pounds of phosphoric acid, 7 pounds of sulphuric acid, 39½ pounds of silica, 10½ pounds of chlorine, and 3½ pounds of sulphur. Of the remainder, 31 pounds are nitrogen; and the balance consists of water, carbonic acid and hydrogen. The nitrogen is the only one of these which it is necessary to supply in the manure or fertilizer. Now, suppose we make a mixture of 150 pounds of sulphate of ammonia, 75 pounds of muriate of potash, and 50 pounds of fine bone-meal, we should have the following substances, which we may compare with those contained in the hay. We should have

	In the fertilizer,		and in the hay.	
Nitrogen	32	pounds	31	pounds.
Potash	37½	"	34	"
Lime	14½	"	15½	"
Phosphoric acid	10	"	8	"

Besides these, there would be some sulphuric acid, soda, chlorine, silica and magnesia in the fertilizer, so that the 275 pounds of mixed chemicals would supply all that was required to make one ton of hay, without taking anything from the soil at all. Now it seems plain enough to me that it is all right."

"You would prescribe for a sick soil just as you would for a sick man, I suppose?" remarked the old gentleman.

"Well, something in the same way that I would feed a child, or a man, or a pig, or a cow. I don't see any difference. If you don't feed a pig something out of which it can make fat, it never will get fat, that is certain; and if you don't give your crop potash, phosphoric acid, nitrogen and the rest of its food, you will have none. Now, does it matter whether you give a pig peas or corn, oatmeal or barley, so long as it has the elements out of which it can make fat? and if not, does it matter whether you give your crops wood ashes, or potash salts, phosphates and sulphate of ammonia; or barnyard manure in which the potash, phosphoric acid and ammonia are supplied? If the crops get these, it matters not in what shape they are provided, so that they get them."

"I like to see a good heap of manure going on to the land," said the old man; "something to fill up the ground and make it rich; and you may talk and talk, but I never can believe a wheel-barrow load of chemical stuff can do the good that ten wagon-loads of manure will do."

"A good many farmers think as you do," I replied, "and a few are beginning to think as Doctor Jones does. But here is my difficulty, and scores of others find the same trouble: what are we to do where there is no manure to be had? We must then use artificial fertilizers for a start, and after that if we can make enough manure we are all right; if not, don't let us cast away the boat which carries us safely over the stream, because we think we shall have a bridge by-and-bye. It is very clear to me that I shall have to make use of fertilizers unless you will sell me some manure, and the question is, what shall they be?"

"I have no manure to spare at any price, and no other farmer that I know of has," replied the old man.

"Just so; no farmer can sell manure; he might as well sell his bread and butter and go hungry. And when barnyard manure cannot be had, some substitute must be provided. We have no substitute for manure but artificial fertilizers, and without these my case would be hopeless. A poor farm cannot be started on the road to improvement without them, unless one has the money to buy stock and feed, and then make manure. When the large capital needed to do this is not at hand, the only resource I can see is, to use some artificial fertilizers. There are twenty acres of rye which I have just sown. I shall put 200 pounds per acre of fertilizer upon the land, which will contain 16 pounds of potash, 10 pounds of phosphoric acid, and 16 pounds of nitrogen. In the spring, I shall repeat the application, which, in all, should enable this land to produce at least 25 bushels of grain and one ton of straw per acre. I shall expect to get 20 bushels of grain if the season is fair. Twenty bushels of rye and one ton of straw, will take from the soil 26 pounds of potash, 15 pounds of phosphoric acid, and 27 pounds of nitrogen. There will be something left for the grass and clover, but not much; and it is a question with me if I ought not to use 300 pounds of the fertilizer instead of 200 pounds. But I shall try 200 pounds, and we shall see the result.

The fact is, that no soil is so poor but that

it contains a vast amount of latent fertility. It is there, but is not available. It is locked up. Every particle of soil, unless it is pure quartz or silica, contains potash, soda, phosphoric acid, magnesia, and other mineral plant food, or rather sources of plant food, in it. And amongst the particles there is always some organic matter which contains nitrogen. But none of these are plant food until they become soluble. To the extent that the rain, the atmosphere, and the sun's heat slowly dissolve out the plant food that may exist in it, the poorest soil is able to produce just so much or rather so little; to the extent that manure or fertilizers help to dissolve more plant food by their action on the soil, the soil can produce so much more in addition to what the fertilizers supply food for; and to the extent that the decomposing action of the roots themselves is exerted upon every particle of the soil which they touch, the latter will still produce so much; so that if we add manure or fertilizers to the poorest soil, we may reasonably expect to get more returned than we have given. This is the theory. In practice we may get this or we may not, and it is safe to expect less, because the season may very rarely be such as to favor all these different results, and may, in fact, exert an unfavorable influence and prevent some of them from taking place. So that it is always safe to supply more than is actually supposed to be necessary."

Rural Architecture.

A FEW AXIOMS IN BARN BUILDING.

W. J. CHAMBERLAIN.

"An axiom is a self-evident truth." So says the definition. Sometimes, however, our attention must be called to it before it is seen to be "self-evident." This is the case with some of the axioms of barn building, to which I propose to call attention.

FIRST.—Money is saved by increasing the contents *perpendicularly* (vertically) not horizontally. Let Fig. 1 be an end section of a barn of any size, with posts thirteen feet high, and showing posts, girths, &c., ready for the siding. Suppose now we double the hight as in Fig. 2. We have doubled the capacity of the barn without increasing the size of the roof. If we double the size horizontally, we must double the roof as well as the siding. But the roof is, proportionately, the most expensive part of the barn. Therefore it pays to economize in roof by making the barn as high as possible without inconvenience. By taking advantage of a slope, or by grading up as in Fig. 2 for a "bank barn," hay, etc., may be drawn in, *part way up*, and pitched down, and thus the additional hight instead of proving a disadvantage in labor, will be an advantage. That this axiom is not understood by many, is attested by the multitudes of low, flat barns everywhere found. That it is an axiom, however,—a self-evident truth,—all will at once admit on examination.

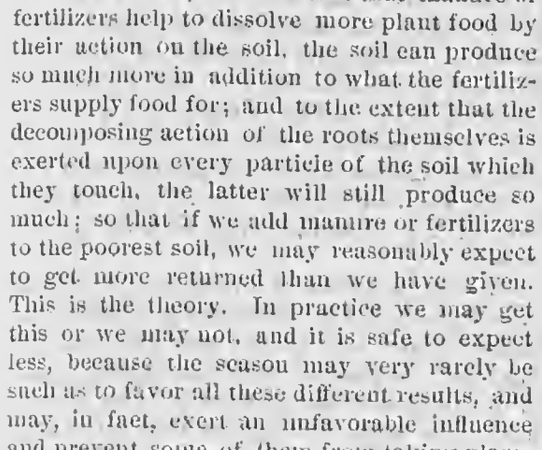


FIG. 1.

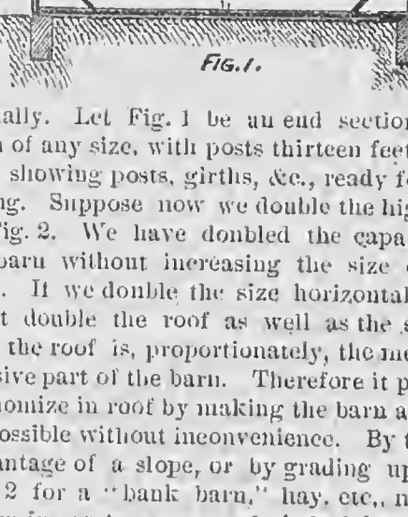

FIG. 3.

SECOND.—It pays to build *one* barn rather *than several covering an equal space*. Let Fig. 3 represent the ground plans of four small barns. Now suppose them simply moved up together and covered by a common roof. Evidently the amount of roof remains the same, except that there is a saving of half the cornice, but half of the sides and half of the ends are rendered useless and disappear. That is, the four barns will require twice the lumber and timber for siding their outsides that will be required for one barn that shall cover the same space and store as much (yes, more) hay, grain, &c. This, too, is self-evident when once pointed out. If, now, the principle here involved be combined with that involved in Figs. 1 and 2, we see that a barn of *twice the length, breadth and hight* of any given barn—for instance, one of those represented in Fig. 3—will hold *eight times* as much hay, &c., but will take only *four times* as much roof and siding; or, in other words, a given amount of money spent for roof and siding will house *twice as much* feed in one such large, high barn as in four small ones costing the same money.

Add to this the great economy of time in the feeding and care of stock in one barn, and we wonder to see small barns scattered all over the farm, as we do on multitudes of farms. The object of this mode of building originally was to save in the hauling of hay and the returning of manure to distant fields. But the best farmers now favor concentration. It has many advantages that I cannot stop to mention here. "Put all your eggs in one nest" is, after all, a good rule in barn-building.

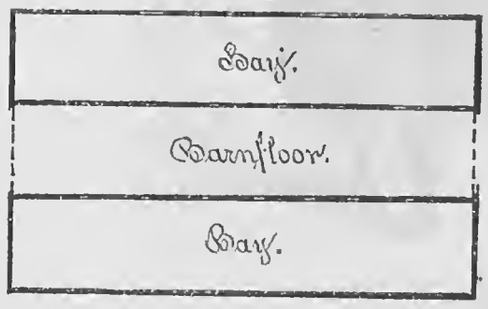

FIG. 4.

THIRD.—The barn floor should run crosswise, not lengthwise, of the barn. Let Fig. 4 represent the ground plan of a barn 45x75 feet. If a barn floor 15 feet wide, runs through the middle *lengthwise*, it occupies *one-third* of the room of the barn, clear to the ridge. If a scaffold is laid over it, it interferes with the storage of the bays, and a high, long scaffold is in itself a nuisance. If, now, a barn floor of the same width runs *crosswise* of the barn, through the middle, as in Fig. 5, c, it occupies only *one-fifth* of the room, and permits the hay in the bays to be stored to the ridge of the roof. In so long a barn it is a good plan to have three sets of doors, at c and b, b, Fig. 5. The spaces b, b, can be used as barn floors till the bays a, a, are filled to the roof, and then the doors closed, and these spaces, b, b, used as bays and filled with hay from the floor, c. The three sets of doors are for convenience in storage. The cattle, etc., are supposed to be below in the basement.

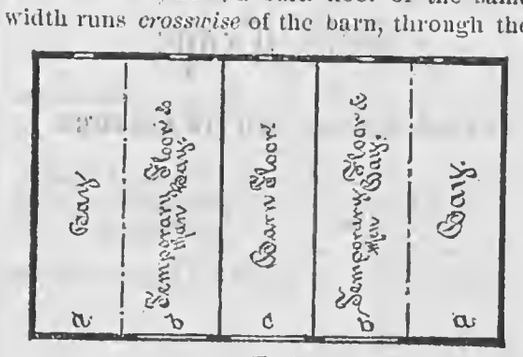

FIG. 5.

I have seen many expensive barns, excellent in many respects, but in which it seemed as if half the storage-space was wasted by wrong arrangement of details, chief among them being the wrong position or direction of the barn floor. Barns will be expensive enough at best, but they can be rendered far less so by careful attention to a few self-evident truths or obvious principles.

Summit Co., O.

The Herdsman.

POLLED OR HORNLESS RACES OF CATTLE.

M. C. WELD.

GENERAL CHARACTERISTICS.

THE horns of cattle are certainly of very little use to us. True, we utilize them finally, but they are too often used as terrible weapons against mankind, as well as against other animals. Cattle are frequently greatly injured by one another's horns, and horses are not unfrequently killed when turned loose in confined yards with cattle. Polled cattle are by no means helpless when attacked by horned beasts, for they defend themselves resolutely, and their heads are well adapted to this use by reason of a considerable knob in the center of the poll, with which they can well push and punish an adversary. In fact, though almost uniformly of a gentle and docile disposition, it often happens that in a mixed herd the *boss* (I use the word legitimately) is a hornless animal. One reason for this is that the hornless ox or cow has so peculiar and, so to speak, unscientific a way of fighting that the others are taken all aback by it, just as an adroit wrestler would be likely to be worsted in a rough-and-tumble "rassle."

The hornless breeds are quiet and good feeders. They lay on fat smoothly, evenly and rapidly. They are so quiet in disposition that they are excellent travelers, bearing transportation by rail or by road better than any of the horned breeds. Their lack of horns is of particular advantage in shipping by rail, as they are very little likely to hurt one another either in the cars or when yarded, and they may be packed closer. Those qualities are elements of profit which, were the breeds better known, would not only make them favorites with the drovers, but, naturally, the breeder would realize his share of the profit in the better prices he would get. Their distinguishing peculiarity is transmitted almost invariably to half- and even three-quarter-bred offspring; and not this alone, but their other good qualities accompany it. The quality of their beef is surpassed by that of none of the British breeds, unless it may be by the Highlanders, and certainly not by any of the continental breeds, and they possess a hardiness of constitution and an aptitude to fatten which are unusual.

As to their form and comeliness when exhibited in perfection, these points can hardly be better shown than by copying from Youatt his picture of a Galloway heifer named "Queen of Scotts," bred by Mr. Mure, fed by Mr. Wright, in Norfolk, and exhibited at the Smithfield fat-cattle show. Her portrait was taken under the sanction of the Club, and the following are her recorded measurements: Hight at shoulder, five feet two inches; length from nose to rump, ten feet four inches; across the hips, two feet six inches; across middle of back, three feet; across the shoulders, two feet four inches; girth of leg below the knee, eight inches; distance of breast from the ground, one foot three and a half inches; width between fore-legs, one foot five inches; weight, 1,520 lbs. The weight and perfection of this heifer were, however, extraordinary.

Youatt recognizes four principal breeds of polled cattle, namely: the Galloway, Angus, Norfok, and Suffolk breeds.

THE GALLOWAYS,

as now bred, are a black breed, though red and yellow used not to be uncommon; of medium size, maturing early, fattening kindly, and very evenly, and producing beef of almost unrivaled quality. The cows have no place in the dairy, but what little milk they yield is of very rich quality.

THE ANGUS

cattle are a closely allied race, and are considered as descended from the Galloways. As would be expected, a more favorable climate, better feed and, perhaps, care, have developed a somewhat larger frame in them, accompanied by greater length of leg and better handling quality. They, also, are black; have grown much in favor of late years; and, judging by the offers of prizes at the English Agricultural shows for "Angus and other polled breeds," as a class by themselves, one would suppose that this was the leading breed among the hornless ones, where they are best known. They are essentially a beef race, and no doubt, as profitable feeders, they are fully equal to their aforesaid cousins, while they are no better as milch cows.

Both Galloway and Angus cattle have been imported into this country and Canada in small numbers, but neither they nor any other of the polled breeds have become as popular as their merits warrant, especially in the beef-producing section of the country.

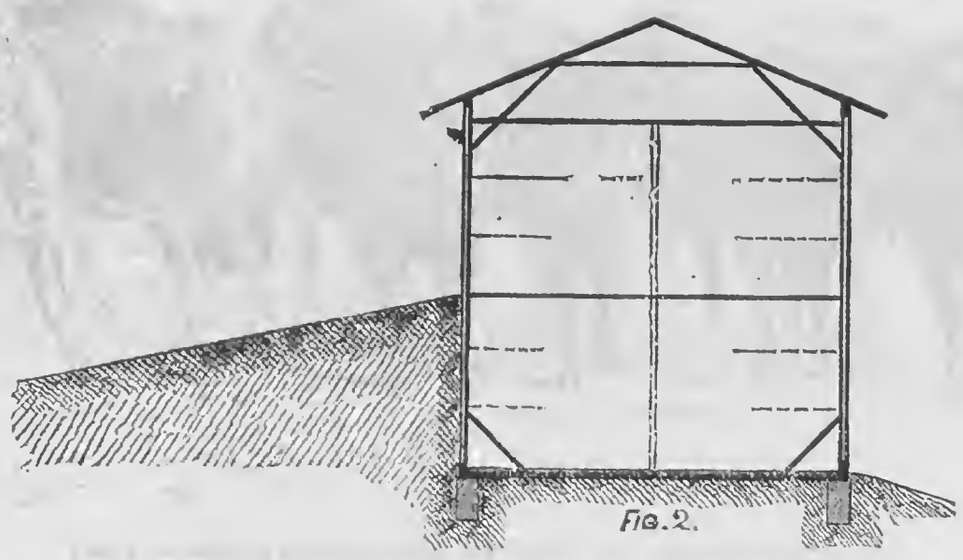

FIG. 2.

THE NORFOLKS

originated from mingling the blood of the Galloways—which were brought in great numbers into that part of England to be fed for the London market upon the rich pastures of Norfolk and Suffolk—with that of the native stock. The original cattle of Norfolk resembled the Devons both in color and general style. The hornless beasts from Scotland were greatly their superiors in flesh-making and quality, so they gradually came to be preferred, and the horned breed gave place to the hornless one, which retains the rich red color of the native Norfolks.

Youatt gives, after a rather unfavorable description of the breed, the accompanying beautiful portrait of a cow bred by Mr. George, of Eaton, near Norwich,—as near an approach to ideal perfection in a useful cow as could well be drawn. It is obvious that the cow is not in full milk; at least with no knowledge to the contrary, and knowing that the breed retains the milk-giving character of the ancient race of Norfolk, we may well suppose that the udder which is in perfect form, is dry, and the same is indicated by the shriveled look of the teats. This portrait of Mr. Eaton's cow, which was taken hardly less than fifty years ago, bears a very close resemblance to the beautiful Norfolk cow exhibited by Mr. Taber, of Patterson, N. Y., at the International Dairy Fair in December, and it is a pleasure to be able to point to a beautiful and useful herd of these cattle in our near neighborhood.

The Norfolks, as now bred, are red, above medium size, of excellent form, and superior as milkers. They are easy keepers, good feeders, mature early, bring good-sized calves, and for the farmer who values cattle for all purposes—namely, for veal, milk, labor and beef—there are few, if any, more attractive breeds.

Of late years especial attention has been paid to improving the Norfolks upon the estate of Lord Sonds, and the efforts of that nobleman and his efficient steward, Mr. Fulcher, seem to have met with merited success. The objection to the Galloway and Angus breeds in this country, has always been that they were purely beef breeds. The Norfolks are not liable to reasonable objection, for they are excellent milkers, and fatten as kindly as Short-horns or Devons, or even as Galloways.

CROSSING POLLED BULLS ON WESTERN AND TEXAN COWS.

The use of polled bulls for Texas cattle and for all the herds of the Western Plains, has often been advocated. Such reforms are not brought about by "precept upon precept." People who sit here on Eastern farms and write letters to the papers, get enthusiastic over great reforms which it seems as if it would be easy to effect, if the people most concerned were only half as wide-awake to their own interests as we are. We wonder why in the world the active, thinking men of the Plains, Texas, New Mexico, California and Colorado, do not work out of their long-horned, slab-sided brutes, and by crossing with improved animals, work into really handy, profitable cattle. They, on the other hand, wonder how active, thinking men can be contented to stay here in this old-fogy, money-lending, dead-and-alive, humdrum East, on our little tucked-up, fenced-in farms. The fact is, the reforms come as fast as it is healthy for them to come. If the breeders on the Plains should wake up suddenly to the conviction that polled bulls were the only ones they ought to use, the supply would be exhausted at once and we would have to import at high figures, and that would discourage the breeders.

The course which seems the wisest for the Western breeders, generally, to pursue, is to combine upon the foundation of their hardy Spanish stock the excellencies of the Short-horn and of the polled breeds. It would matter little which cross was first taken. Were the polled bulls first crossed upon Texas cows, the progeny would be horuless, greatly improved in form and quality, not essentially increased in size, but weighing more at parallel ages; much quieter, less prone to wander, more tractable, and making a better use of their feed; that is, keeping in better condition on the same food. They would mature earlier, probably,—certainly, if well fed. They would not show themselves fighters, but would defend themselves well against horned animals. When the heifers come to profit, they will be found fair milkers, if of the Galloway or Angus cross, and uniformly good to large milkers, if of the Norfolks. The young bulls will be found to propagate the characteristics of the hornless breed with considerable regularity, and will be sought for as breeders. Example is better than precept, for it is *contagious*.

OTHER CROSSES.

The use of Short-horn bulls upon these cross-bred or grade heifers, will generally result in increasing size, confirming their early maturity and their early fattening qualities, as well as their gentleness and quietness of disposition. Few horns will develop, but there will, no doubt, be an occasional reversion in the second generation to the long horns of the Spanish beasts.

The cross of Short-horn or Short-horn-American bulls upon Texas cows, is well known and highly valued. It increases size, quality, weight, early maturity, milk and all good points. The cross-breds, or grade Short-horns, need, however, better care, better feed; and

they fall off, "shrink," worse on the road. The crossing of polled bulls upon these grade cows may be depended upon to give a class of cattle which, while they will have all the advantages of the Short-horn grades, will do better on rather short pasturage, travel much better, shrinking less, and packing closer both in yards and on railway cars or steamboats. There seems to be every reason why we should value the polled breeds in this country, the Norfolks being apparently best adapted to Eastern and central farming—say to the great dairy region—and the Galloways or Angus to the great beef-raising and feeding sections.

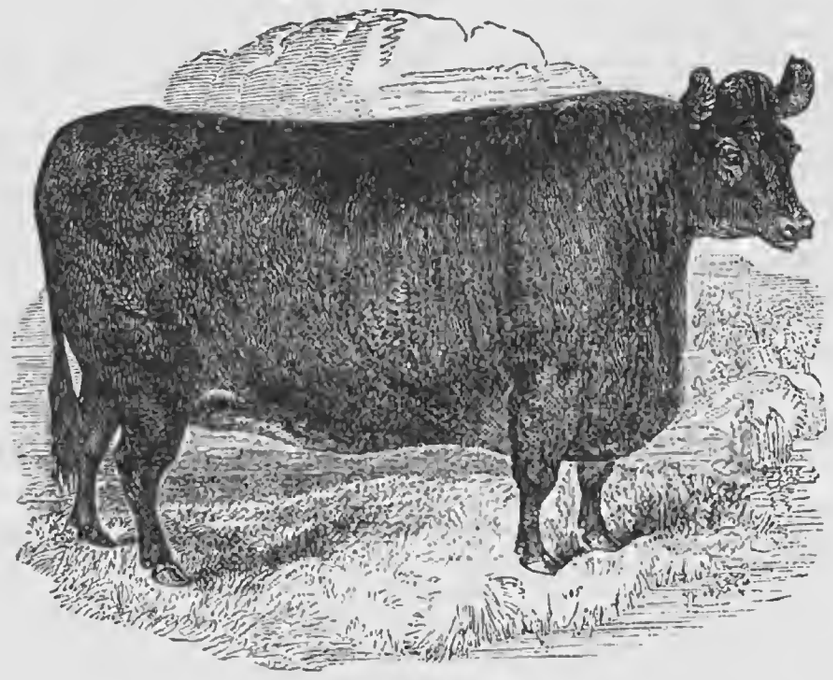
A FAMOUS GROUP OF POLLED CATTLE.

THE accompanying engraving of the champion group of Angus, or Aberdeen cattle exhibited at the late Paris Exposition, by Mr. McCombie of Tillyfour, Aberdeenshire, is a faithful reproduction of an illustration taken from photographs, and published in the Agricultural Gazette for January 20, '79. The animals were taken "at home" after their return from the great Show and when they had recruited on their native pastures from the miseries of the quarantine to which they had been subjected. More than one reference has been made in the RURAL to the high distinction won by the members of this group individually and collectively, and it gives us pleasure to be able to place before our readers accurate portraits of the animals which carried off the highest honors at the World's Fair, and have won for themselves and their owner a world-wide celebrity.

On the left flank is Gaily, a four-year-old cow. On her right is Sybil 2nd, two years and three months old. Next comes Pride of Aberdeen 8th, probably the most valuable animal of the breed in existence, her owner having refused upwards of $1500 for her. Fourth comes Halt 2nd, one year and eight months old, the easy winner of the first prize and gold medal in her class. Then comes a little beauty, Witch of Endor, one year and three months old, while on the right flank is Paris, one year and two months old, the gainer of the first prize and gold medal in his class.

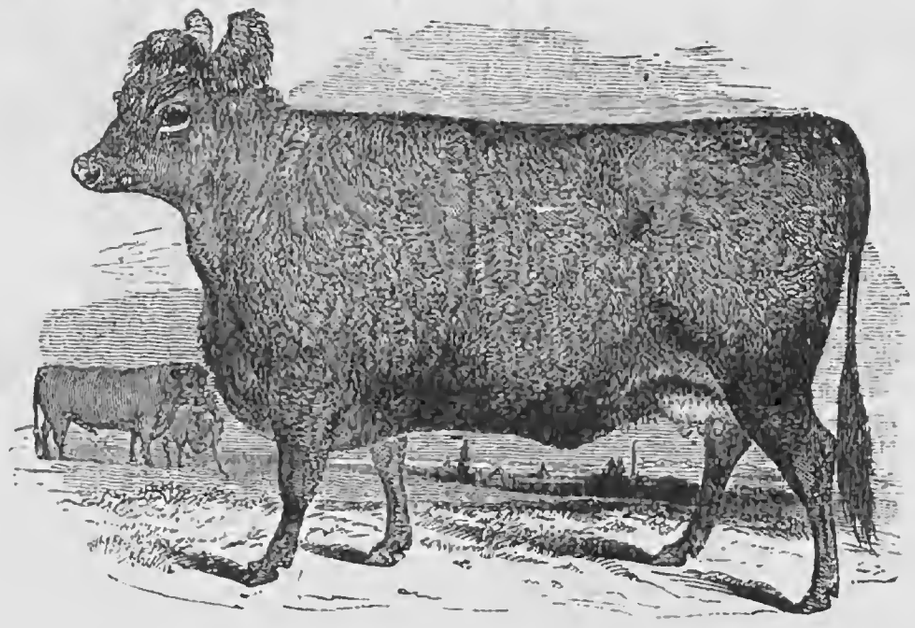
STOCK NOTES.

JOTTINGS.—At a recent meeting of the agricultural department of the Royal Jersey Agricultural and Horticultural Society, it was stated that the returns show that the exportation of Jersey cattle during the preceding twelvemonth, amounted to 2,080 head. Of these 1,790 were for England; 210 for America and 80 for France. Regrets were expressed that so many of the best stock were sold for exportation, and measures were suggested by the adoption of which it was hoped that the best bulls might be retained on the island. . . . The (English) Farmer mentions the case of a cow-calf of Dutch breed, whose udder began to swell when the animal was only two months old. When six months old, the udder was fully distended, and thereafter the calf was regularly milked every day. When eleven months old, the animal's development was backward, but she gave about four and a half quarts of milk daily; it contained, however, a little more water than that of a full-grown cow. . . . The Bulletin of the A. J. C. C. mentions another instance of early lactation. In 1873 Mr. Parke's heifer Anne Page (2,690) when eleven months old began to yield two pints of milk daily, which she increased to two quarts within a fortnight. She was taken to the bull for the first time when twelve months old. . . . The English Herd Book of Angus polled cattle has reached its fourth volume. . . . Holsteins were first introduced into this country in 1852 and the last American Herd Book of that breed contains the names of 197 bulls and 251 cows, or a total of 445 head. . . . Thiers, one of the shrewdest men France has ever produced, said, "The agriculture of France cannot dispense with sheep" and many of the most progressive farmers in the Eastern States seem to think the saying true of their own section also. England's 34,532,000 sheep on 77,284,184 acres, yield annual products worth $150,000,000, and, moreover, English farmers consider that sheep have contributed more than any other kind of stock towards enriching the land so that the average yield of wheat, which in the days of Elizabeth was six and a half bushels to the acre, is now upwards of thirty bushels. It has been well said, however, that a few sheep well cared for, will be profitable on every farm, while a large flock would, in nine cases out of ten, be a source of trouble and expense to the ordinary farmer. Dr. J. L. Hayes, Secretary of the National Association of Wool Manufacturers, says that the enormous clip of Canada wool is obtained from small flocks, rarely exceeding fifty head. He recommends long-wooled sheep, especially Cotswolds. . . . A Stock-Breeders' Association has just been organized in Mississippi with a view to dairying and fine stock raising on the prairies in the eastern part of the State. Already a commencement has been made, as it is estimated that 400, or so, of the inhabitants, have a few choice hogs or sheep, and, now and then, a few head of thoroughbred cattle. . .



GALLOWAY HEIFER.

. The Department of Agriculture's statistics of the live-stock in this country in Jan., 1878, though not strictly accurate, are the most trustworthy attainable. These estimates made up from a multitude of local reports, show that of horses we then had 10,329,700, valued at $600,813,681, an average of $58.16 for each animal; of milch cows, 11,300,100, valued at $298,499,866, an average of $26.41 each; of oxen and other cattle, 19,223,300, valued at $329,541,703, an average of $17.14 each; of sheep, 35,740,500, valued at $80,603,662, an average of $2.25 each; of hogs, 32,262,500, valued at $160,838,532, an average of $4.98 each. New York was ahead in the number of milch cows, having 1,404,100. In "other cattle" Texas took the lead with 3,458,300. Illinois was next, but a long way behind, with 1,274,100. That State, moreover, was first in horses, having 1,091,500. Iowa stood first in hogs with 2,950,000, and next came in order Missouri, Indiana, Ohio and Illinois, none of them with less than 2,000,000 porkers. . . . An English correspondent for whom the National Live-Stock Journal vouches as an authority in such matters, says that for fat bullocks the West Highlanders are the best that come to the London markets, bringing from half a cent to a cent a pound more than beasts of any other breed. They are seldom fit for the butcher till fully ripe, bring top prices every time. The Hereford being a grass beast, is most prized in July, August, September and October, when he readily tops the market. Despite the large number of Short-horns in the country, few bullocks of that breed reach the London market, and although some bring top figures, as a rule they sell at lower rates than any of the sorts already mentioned. The Polled Scots, he thinks, require a northern climate, and plenty of roots—swedes and turnips. When brought south, he says, they frequently merit the sobriquet of "pensioners."



NORFOLK COW.

Field Crops.

PEARL MILLET AND ITS CULTURE.

Twenty-five years' experience with it; drilling it; its early appearance and rapid growth; growing it in double rows; broadcasting it with cow peas; as a soiling plant.

FOR the benefit of numerous inquirers about this valuable forage plant, and the best method of its cultivation, I give, through the RURAL, my experience with it for twenty-five years past, the most economical plans of growing it profitably, and the uses for which it is adapted. I have attempted to utilize it in a variety of ways, never failing to reap a satisfactory crop during the long period of its growth here, in latitude 33° north. It probably finds its most congenial home and greatest development under our long, warm suns, and in our porous soils. It revels in a dry sandy loam, and is the grossest feeder and most rapid grower of all the Sorghum family, if it properly belongs to this family of plants. [Same order—genus Penicillaria,—EDS.]

The land being made fertile, if not so naturally, after breaking it well, I make the beds some four feet apart, harrow off clean, open a very straight furrow with the marker, and drill in with any one of the hand seed drills about three pounds per acre of the clean seed, and cover it lightly. When the seed first germinates, the grower will feel discouraged. The very fine, grass-like spears do not promise the gross, luxuriant crop, of which boasts are constantly made, and after a few cool mornings have turned the blades to a sickly yellow, he will be almost tempted to pronounce the crop a failure. But a slight side-line hoeing, together with the warm suns of May and June, makes a most rapid change; and by the tenth of June the plants have here attained a hight of from three to four feet, are fit to be cut as a green soiling crop, and furnish a cutting every fifteen or twenty days thereafter, till frost. I cultivate simply with the horse hoe, cultivator, or sweep in the middle of the rows. I seldom give more than one hand hoeing. I never chop through the stalks, except where seed are grown, but let the plants stand thick in drills, shaving the sides of the drills with the hoe or sweep.

The best method of growing it is in double rows on a seven-foot bed, with the drills fifteen inches apart. The plants soon close up the interval. No grass or seeds can appear. And in this form it is the prettiest growing crop I have ever seen. Sweeps or the cultivator should be used only in the wide middles. In these double rows it is easy to cut with a stiff grass scythe, the hand having more room to operate on each side of the drills.

The third and most profitable way to grow it I find is to broadcast it with our field cow peas, on rich land about the middle or last of May. Having put a piece of rich soil in good tilth, I broadcast one and a half bushels of peas to 215 pounds of millet seed, harrowing in the mixture and rolling the surface. Under our warm suns both plants start the race together, each struggling for the ascendency; the pea climbing upon the middle stalks, dwarfs the latter, and the two make a dense mass of the finest green or dry forage, which can be cured better than if grown singly, as the millet stalks are now quite small and spindling. In the two plants there is a combination of a "cereal" with a "legumen," and this makes a valuable rich winter food for all stock. If one can conceive a vegetable-growth, from four to six feet high, so dense that a rat could scarcely pass through it, and on which a horse and cart might stand over a full load for the latter, his conception would be realized here by this combination of growth on rich land, in August and September. The plant seems to be greatly influenced by sun and moisture. Commencing in March, I plant it every month till August, either in drills or broadcast. It would probably be advisable not to put the crop two years in succession upon the same spot, unless it be well manured. It must draw heavily upon the stores of fertility and consume all plant food in the soil, being so long a grower. It will give a return in proportion to the food given it, and during the many years in which I have planted and used it, I have often wondered that its merits were not properly appreciated.

I have never tried keeping it by "ensilage," but I should suppose that with its latest growth in September, this plan would succeed admirably. I use it principally as a green soiling plant for horses and cattle, and know of no crop that furnishes so much green, succulent food.

W. B. JONES.

MR. M'COMBIE'S CHAMPION GROUP OF POLLED ANGUS CATTLE AT PARIS.

Industrial Topics.

HOW TO SECURE A GOOD COUNTRY SCHOOL-HOUSE.—No. 2.

PROFESSOR W. J. BEAL.

"Agriculture advances with the improved conditions of the common schools."

There is more at stake in a little country school than some of us are aware of. The surroundings of a child exert a wonderful influence for good or ill. It is good economy to see that the school-house and its surroundings are convenient and pleasant. For beautifying the ground, employ a landscape gardener or the man or men of your own neighborhood, who have displayed the best taste in beautifying their own homes. Before constructing a school, do not be afraid to pay a small fee for plans to be examined. Then, on these plans get the advice of a committee of teachers. Every man is not a landscape gardener or an architect, any more than he is a blacksmith or a doctor. By employing the best men for each place or business, time and money are saved and verything goes off better.

There are numerous approved patterns of stoves and furnaces which are made for bringing into the room, in a partially heated condition, an abundance of fresh air, and for expelling the impure air. To do this may take a trifle more fuel but it will prevent cold

draughts, drowsiness, pale faces, and poor health. Good health is a priceless treasure, often too little prized till it is taken from us. To regain it we are willing to spend fortunes; to preserve it in our children we should take all reasonable precautions.

A school-room, even the poorest, need not be destitute of ornaments. A little effort on the part of a teacher or of the school board, will secure some pictures, brackets and vases for flowers. Once in a while some evergreens may be tastily arranged and suitable mottoes placed about the room,

And now after making all needful preparations in the house and its surroundings, do not neglect the most important part of placing a first-class teacher in charge. The people may be poor, the number of children small, the times hard, and the most rigid economy seem necessary; but here is one of the last places wherein to cut off expenses. The enterprising farmer does not try to hire poor, cheap hands to do his work, because produce is cheap or because he is in debt. He knows the best are the cheapest at any reasonable price. He hires men to drive his team, to feed his animals, milk his cows, plant, cultivate, and harvest his crops. He does not expect that even his best men will perform these duties with profit to himself without some of his personal oversight. To perform this work, he often pays a man more wages than is paid the teacher of the summer district school. He is willing to leave this cheap teacher with entire control of his children all summer for the best hours of the day, but he would not think of trusting the entire care of his swine to the best man he could hire. He could not afford it. He would lose money. Swine may live a year or two and that is the last of them. The children will probably live forty to sixty years, and mold the character of those who follow them, and, to some extent, of all those with whom they associate. There is no reason in thus discriminating between the care of our domestic animals and of our children. Is it not a wonder that the district schools are as good as they are, considering their management?

Every farmer does not know how to superintend a school. But few of them know how, and they are aware of it, hence they do not visit the schools or attempt to interfere with their management. In some States the people employ skilled or *professional* persons to superintend their schools, but in many places there is almost no supervision. The school runs itself, if the teacher and scholars can get along together. Every man ought to be expert at his own business, and has no reason to expect he can do everything and do it well.

To all I say, employ only good teachers. How can this be done? Certainly not without taking some pains to find out that they are good. The candidates should be thoroughly examined in various studies, by *competent* persons, who make this their entire business, or an important part of their business. This is not all. Good testimonials must be produced, vouching for moral character, correct habits, etc. If the person has ever taught school before, great care should be taken to learn that he has liked the business, kept good order, and succeeded in interesting his pupils. With thorough examinations and a searching inquiry of reliable persons as to character and former success, competent teachers can be selected.

There is no objection to hiring such persons at the lowest possible rates that will employ them, but hire them at any price, and do not take up, even for one term, with a person who does not bear the severest test. In hiring for low wages, this must be taken into consideration: the teacher will not be contented with his place or business. He may think it important to give part of his time to something else, to eke out his small salary. If he is possessed of good caliber, he will soon engage in some other business, where his energy will bring larger returns. This will make it necessary to employ new and untried teachers. Frequent changes of teachers are much to be avoided.

Agricultural College, Lansing, Mich.

RUSTIC VASE SUPPORTERS.

Rustic work or ornaments, if more generally used about our premises, would add much to their beauty, and that cheaply, too. For instance, the vase supporter shown at Fig. 2, is simply a portion of the top of a tree with parts of two or three branches remaining. The main portion may be from three to five inches in diameter and about five feet in length, set firmly in the ground. The tops of the branches and main stem are cut off square; use for the main stem a large vase, or even a tin jar or wooden butter bowl, if at hand; and for the branches, pint or quart basins painted green. Nail them firmly in position, fill with earth; place in them some hardy running vines, and in the large vase a Monthly Rose or Verbenas, Petunias or some low-growing flowering annual. If possible, cover the earth in the vases with moss, which retains its moisture, necessitating less care in watering. Let the bark remain on the supports, and the

FIG. 1.

more scraggy-looking they are, the better the effect. A few Morning-glory plants allowed to entwine about the support, will add much to the beauty of the whole. The arrangement in Fig 1. is a support for one vase only; and should be only about two feet above ground, and if in a settled situation, the vase may be filled with tall-growing plants.

CATALOGUES, &c., RECEIVED.

Register of the Vermont Merino Sheep-Breeder's Association, Vol. 1.—Somewhat over half-a-dozen years ago a large New England lock company was reported to have lost heavily by the issue of a very expensive catalogue of their wares. The edition of 2,000 copies cost them, it was said, $80,000, or $40 apiece. A copy of the work was presented, *gratis*, to each of their customers who bought $500 worth of their goods in a single bill, and the remainder of the books were kept on sale to the rest of the trade at cost price. Judging from the growing tendency towards artistic and expensive catalogues among those who wish to employ such compilations to introduce their goods to the favorable notice of the agricultural community, we are sometimes disposed to think that there is some risk that a few of these may share the experience of the getters-up of that costly lock catalogue. The size, the fine illustrations, the neat French-morocco binding, and the general make-up of the above-named work strongly suggested this reflection.

Besides an interesting account of the introduction of the Merino into the United States, and 22 excellent engravings of fine specimens of that breed—it contains full information with regard to the history and breeding of the various Vermont Merino flocks recorded in the book. Now that a lively interest is aroused throughout the country in pure-bred stock of all kinds, this publication is very timely, of interest to all sheep breeders, and of importance to the owners and intending purchasers of the oldest breed of all sheep—the Merino. The work is well edited by Albert Chapman, of Middlebury, Vt., Secretary of the Association, and is offered for sale at $2, which, we are assured, is a trifle less than the cost of the book and postage.

The Ensilage of Maize and Other Green Fodder Crops. By M. Augustus Goffart. Paris, 1877. Translated and published by J. B. Brown, 55 Beekman street, New York. Price $1.

This is a neat little book of 79 pages, printed in large type upon glazed paper, handsomely bound in imitation morocco, and containing a full account of the method of preserving fodder by ensilage, the way in which the plants should be grown, cut and stored away, the changes that take place in their constituents, and, in short, of every particular that might interest or instruct those who may adopt this excellent method of preserving stock feed. Just a word about translations of such practical works, designed for the use of the farming community. In mentioning the measures throughout the work the original French terms are used. It seems to us that these require translation into American equivalents just as much as, if not more than, the rest of the work. It is a poor excuse for this omission to point to the vocabulary prefixed to the work, wherein the reader may learn that a *litre* is equal to 1 76-100 pint or 61 cubic inches; a *centime* to one-fifth of an American cent; a *kilogramme* to 22.055-10,000 lbs avoirdupois, and a *hectare* to 2.471-1,000 acres.

Even a mere reference to this vocabulary must distract the reader's attention, and to "work out" into American equivalents the quantities and areas mentioned throughout the

FIG. 2.

work would be a labor too tedious, not only for most farmers, but for most readers of any class. Such a source of obscurity and incomprehensibility is hardly pardonable in quotations from foreign authorities, even in the short-lived pages of an agricultural paper, and should never find place in a work which, like that before us, deserves to become a standard on the subject of which it treats. The recent introduction of the metric system into most of our public schools will, doubtless, in time, obviate the necessity for such translations, but those who publish books to-day will scarcely be content to wait for their sale until then, and meanwhile it's hardly reasonable to expect that adult readers will hunt up smart school-boys or, better still, girls, to work out the sums.

Alfred Bridgeman, 876 Broadway, N. Y.: Annual descriptive catalogue of vegetable, grass, herb and flower seeds.

Mr. Bridgeman was good enough to send us a large assortment of novelties last season. These were planted and marked with usual care; they germinated freely, but were cut off by the late frost which, everywhere in this section, perpetrated so much damage. This is an old establishment, and a very trustworthy one. The catalogue is finely illustrated with accurate portraits, and the lists of seeds are printed in large type, with all needed details.

E. P Roe, Cornwall-on-the-Hudson, Orange Co., N. Y.: Descriptive Catalogue and Price List for 1879.

This catalogue is full of the information that the enterprising grower of small fruits most needs. All the best varieties of Strawberries, Raspberries, Grapes, Gooseberries, Currants, &c., are offered with impartial statements regarding their merits from many people and from many localities. We believe that Mr. Roe tries to tell the truth, a little matter that many small-fruit dealers disregard in proportion as the telling of it interferes with the sale of their plants. The catalogue will be sent free to our subscribers.

The American Stockman. This is a daily, semi-weekly and weekly journal; price, per annum, $5, $3 and $2 respectively; published by the American Stockman Co. at Chicago, Ill. It is devoted to the live-stock interests of the country, and the excellent character and wide experience of its editor, E. W. Perry, are ample guarantees that it will be conducted on high principles and in an effective and progressive manner.

State Supervision of Insurance. Speech of Hon. C. R. Knowles, made in the House of Assembly, New York, in support of such supervision; also, a pamphlet of 16 pages, giving the opinions of the various Insurance Companies in the State with regard to the matter, nearly all of them in favor of it.

D. C. McGraw, Binghamton, N. Y. Abridged catalogue of seeds, greenhouse and bedding plants, shrubs, evergreens, &c., for the Spring of '79. This, as well as his larger plant and seed catalogue, sent on application.

The Brazilian Tea—Cha-maté (Ilex Paraguayensis). This is an illustrated pamphlet of 19 pages concerning this new aspirant for cultivation in the extreme south of this country, by Charles Wm. Zaremba, M. D., etc., etc.

B. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, London, N., England: Descriptive catalogue of agricultural seeds, &c. 65 pages, profusely illustrated.

Industrial Implements.

CORN SHELLERS.

The Sandwich Manufacturing Company of Sandwich, Illinois, is said to be the oldest house engaged in the manufacture of Power and Hand Corn Shellers in the United States, it being now nearly a quarter of a century since they commenced that line of manufacture in a small way and with a few men. They now employ more than 200 hands and, at this season of the year, are taxed to their utmost capacity to keep pace with the demand. They make shellers of all sizes and capacities—from the large warehouse and portable sheller with capacity of 3,000 bushels of shelled corn per day, to the one-hole "Count" hand sheller, illustrated on this page, which has a capacity of 150 bushels per day. This and the "Veteran" sheller, advertised in this number, are probably best adapted to the wants of Eastern farmers and millers, while the larger sizes have an immense sale in the North and West and Northwest, as well as in many sections of the East and South, where corn is raised in sufficient quantities to warrant the use of a Power Sheller.

We recommend the Veteran Sheller especially, to the notice of those farmers who have use for a small Power Sheller of convenient size and capacity for general farm use. It is a machine that with proper care will last a lifetime, and may be operated by wind, horse, steam or water power, or by hand. We advise all who contemplate buying a sheller of any size or for any purpose, to write for their circulars

Sandwich Manufacturing Co's. Corn Sheller.

Everywhere.

NEBRASKA NOTES.

Yesterday I saw a neighbor buy a Dickey No. 2 farm mill for twenty-five dollars, on time at ten per cent interest. The mill is good enough, but I opine my neighbor must be exceedingly shrewd and fortunate, or a year hence, he will find his note a difficult one to take up. In this section there is no profit in extensive wheat growing. It demands expensive machinery—the drill, the harvester and the thrasher. Before the "labor-saving-machinery" era farmers were compelled to offer large wages to secure a hasty harvest, and without reason laborers to-day demand an exorbitant price if they handle wheat. Last summer, hands asked one dollar and fifty cents per day for handling nicely bound bundles of wheat, but were willing to handle heavy Hungarian hay all day for seventy-five cents. It occurs to me that the wheat-growing farmer uses machinery needlessly expensive. Every self-binder that comes into this county meets my mental regrets. Think of it—over three hundred dollars for a binder that is expensive to keep in repair and feed with a wire, and at best is used but a few days, leaving the farmer still to invest another hundred before he can cut his hay.

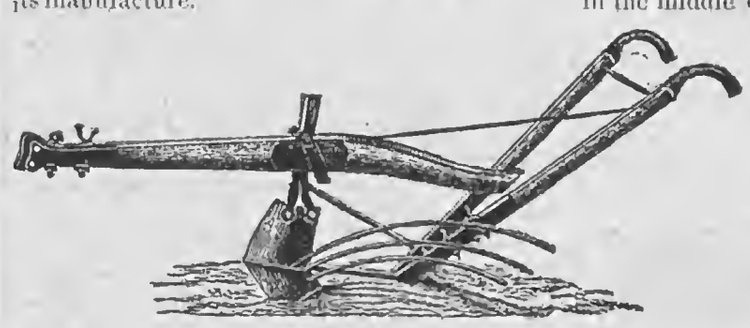
A history of the reaper from the time it was held in the yeoman's strong hands until it reached its present complicated form, would be full of interest. Let us look critically at one chapter in that history. The harvester carrying its crew of binders, sailed for a season over the cereal sea. To an ingenious man, the first perfect working harvester must suggest the doing with arms of steel what was often imperfectly done by the two or three binders. This actually occurred, and presto! "Orthello's occupation's gone." It was necessary to elevate the grain, wind or no wind, to suit the living binders' convenience, but why hoist it up in the wind to be bound in wire? I here throw out a suggestion, hoping that it may prove a bonanza to some grateful genius who will remember me with the materialized idea: Combine the binder with a table rake. When the gavel on the table is compressed ready to be delivered, tie it up and gently push the bound bundle off. Why not?

The next step is to cut hay with the same machine. My experience proves that a two-wheel machine is not the best for cutting grain, and a one-wheel machine is an imperfect mower. We have already learned to overcome that difficulty. I can name a machine that has two wheels when mowing—and a good mower it is, too, its only objection in my eyes lying in the fact that it is a rear-cut—but in grain harvest its two wheels are put side by side on the center of the axle, thus making it an equally good reaper. The two four-inch-wide mower-drivers make an eight-inch reaper wheel. What would be the gain in such a combination? 1. Two hundred dollars, or fifty per cent. on first cost of the machines. 2. A machine that would work well in the wind where many binders work badly. 3. One horse less in harvest, as no power would be consumed in useless elevating. 4. A trifle would be saved in grain by binding the gavels near the ground instead of binding them high up and throwing the bundles out of the way, thus shelling more or less grain.

PLOWS.

The Center—Nebraska is not in the West—has plows peculiarly adapted to the wants of its inhabitants. Our stirring plows, made of steel, are short, light and costly. The furrow slice is suddenly raised and pitched as much forward as sidewise, and tumbled upon its head, stubble and ordinary "trash" entirely disappearing. The longer mold-board of the East would seem to be of lighter draft, but it would not "stir" or pulverize as does ours. I say "would seem to be of lighter draft," for if those iron fellows of the East have not been materially modified since my boyhood days, our light steel plows would "get away with" them so far as lightness of draft is concerned, provided each moved an equal amount of earth. I notice a gradual change in the form of plows as annually sent out by the factories to this "plowman's paradise." Our breakers which are not intended to *break*, but simply to invert about two inches of the soil, have grown longer from heel to point, aiming to lift the slice as gently as possible, and let it fall over.

While the mold-board and land side have grown ridiculously long, the share or "lay"—as we call it—has grown correspondingly short. Our breakers now are divided into "square cuts" and "slanting cuts." The latter often have iron land sides with a piece of steel deftly welded to the heel, where there is the greatest amount of friction. The more slanting the cut, the greater necessity for the steel and a long land side. The question occurs, "Is not the friction that calls for the use of steel, a continual loss?" A square cut was patented and put on the plow, with gratifying results. It was found that the plow fitted in this way, was of about one-third lighter draft in the ordinary conditions of the soil than those without this device, and the difference was still greater when the ground was so dry that a "slanting cut" could not be used; for then the "square cut" worked excellently. It is expensive, however, and the land side is superfluous. An enterprising friend of mine has brought out another plow which he names the Eureka. It is not patented, and an ordinary mechanic can construct it without a heavy outlay. It is sold by the inventor for a dollar an inch, that is, a twelve-inch plow for twelve dollars, and a plow that cuts a furrow fourteen inches wide, for fourteen dollars. The accompanying cut shows its construction and may aid in its manufacture.



It would be poor economy, indeed, to incur the freight on such plows from a distance, as any good local mechanic can supply them cheaper than those made elsewhere can be furnished, with freight and other charges added to the cost of manufacture.

The advantages claimed for this plow are: 1. Lightness of draft; 2, it is a "dry ground breaker;" 3, the expense of keeping it sharp is ten per cent. less than that for the patented plow: and, 4, the first cost is thirty per cent. less. When the plow gets dull—which it will not do much sooner than a spade—it is sharpened on the blacksmith's anvil. Only two bolts are removed to get the plow ready for the smith. The rods cause less friction than the old-style mold-board. The strop of iron running from the horizontal cutter to the bottom of one of the handles, stiffens the plow and steadies it in running.

Orleans Co.

NOTES FROM SOUTHERN TEXAS.

As regards the fruit and nursery business in Southern Texas, the following extract from a friend's letter of January the 20th, may interest some RURAL readers. He lives in Washington Co., on the Austin branch of the Texas Central R. R., and in a lovely country—rolling prairie considerably broken by timber belts—about 11 miles west of the Brazos River. The soil is sandy and black sandy, inclining to hog-wallow along branch and creek bottoms.

"A good many trees are sold" (by agents—W. F.), "but the collections are uniformly deficient. * * * We are planting nursery stock in the field below the R. R., and which we recently bought—soil, a black sandy; but I think the cut-leaf ants and the poisoned spots in the land are as bad there as anywhere else. These two things, with some others, are the peculiar curse of this country. (They are. Cyanide of potassium dissolved in water, and a little poured into the mouths of their holes, kills a multitude of ants, but it must be repeated weekly, and the cost of time in applying it is a great consideration. They may also be dug out, flooded out, and fumigated in their towns, but altogether their annihilation is a tedious, laborious and expensive job,—far better settle where such a curse does not exist. For the 'poisoned' spots in the land, I never knew a cure.—W. F.) Trees and plants are continually dying out. Very many pear and apple trees in our orchards, and which a few years ago were very promising, are now dead, and I think a year or two more will finish all. A year ago we planted a new peach orchard of 5,000 trees—mostly Amsdens and Alexanders. They have grown well. It was a timely plant, as the old peach orchards are nearly run out. None of these cultivated fruits seem to be durable in this soil and climate, not even the Peach, which has always been claimed to be specially suited for Southern soils. We had an abundant crop of peaches last summer, but got nothing for them, as the country was full of peaches, many young orchards just coming into bearing, and the few small cities in the State require but few fruits, and St. Louis is too far off, and rates thither too high to ship. The present promise for fruit is not good; our trees are mostly run out and many of them half-dead; many of them blossomed in December, when the last half of that month was quite cold. This phenomenon of late fall blooming also occurred in the Long Island orchards, as I notice in the newspapers. The present winter, so far, is unusually cold and rainy. All our soft-wooded plants froze in the greenhouse,—we have a greenhouse but no heating apparatus in it. * * * We were much frightened all last summer because of the yellow fever, but had none of it in the State, so far as I know. * * * I read in the papers of snow four feet deep in Central New York, which is my old home. No snow here at all, but in the northern part of the State there are from four to ten inches, and in some places ice has been cut and packed. Times are hard here, money scarce, wages low; nobody has money but the three-per-cent-a-month men and the Jews. A good crop of cotton, but prices so low—six to seven cents—that it is a loss to raise it, but it is the only thing to make money out of."

WILLIAM FALCONER.

RURAL SPECIAL REPORTS.

KANSAS, Parsons, Labette Co., Jan. 27, 1879.—A sudden and great change has come over the spirit of the weather. The sun and southerly winds operated the whole of last week, and though the temperature rose to 58 dg. and 62 dg. in the middle of the days in the last of the week, it required the full week to liquefy the snow, which rested upon a couple of inches of ice. There is not a vestige of it in sight. It remained on the ground just six weeks. Though an inexperienced person might naturally think to-day, that winter was gone, this would be a wrong conclusion. We shall yet have several cold snaps, but in future the sun will quickly put an end to them. Fine days here in the spring and fall, are quite illusory. A stranger was here one day in late December, (not 1878). He sat with his friend on a sunny bank, and the new-comer was surprised beyond measure at the bright warm sun, and the soft south wind. He would write straight home about the delightful country. The friend told him to leave room for a postscript. They met the next morning, one running *from*, and the other *right into* the teeth of a bitter northwester. "Did you send off your letter?" asked the friend. "Yes," said the stranger, "and the postscript, too."

It is quite probable that the wheat in this latitude will be thin, as the seed did not germinate well: still, the sanguine newspapers represent that it looks well, etc. The acreage is probably one-fourth less than that planted last season. Of course, corn, potatoes, etc., will occupy the place where wheat was last year. Owing to a very inferior yield of all farm products in this (south-eastern Kansas) section, and the low prices of grain and stock, farmers are in a very bad state. But we find they are no better eastward. Taxes here are not heavy, say 2½ to 3 per cent. on a 50 per cent. valuation. If not paid when due, then follows a penalty of, say, 24 per cent. every six months, and penalty and taxes failing to be paid, the property—real—is sold, and if not redeemed, will be lost. Execution issues immediately for personal property tax, if not paid when due. Many farmers have mortgaged their farms, and a great many mortgages are being foreclosed.

The land is entirely destitute of swamps and only an exceedingly small portion is not available for cultivation, this portion being stony. The country is beautiful, all the streams running between the rolling prairies, being fringed with trees. The climate is that of the Indian Territory—from the north line of which we are only 20 miles distant—and is not excelled in the Southwest, except on the Pacific Coast. People living off the "bottoms" escape the malaria, and when cultivation becomes general, the country will be more free from such diseases than Illinois or Indiana. We are 965 feet above the sea. It seems a little singular that no one is sun-stricken here. The oldest physicians have never known of a case. The highest point of the thermometer last year was 98 deg., and with a heat over 86 deg., we always have good breezes. Our nights in summer are invariably luxurious. I have never known a case of hydrophobia here, and in all conscience we are not in want of dogs. J. B.

TENNESSEE, Humboldt, Jan. 28.—A general thaw has set in hereabouts. During the past week the mud and slush have been simply awful. We are now having spring-like weather with thunder showers. Bull-frogs are croaking lively, as a sort of bass accompaniment to the cheeringly melodious songs of the mocking-birds. Elms, Maples, evergreens, etc., are pushing out their buds and blooms. We count this a hard winter, however. Since the first of December ice and snow have been abundant all the time until quite lately, the thermometer varying from freezing point down to zero, and several times dipping down 5 deg. below that. Stock and small grain are looking well. Provisions are abundant and at low rates. Pork, 4c. per lb.; bacon, 6c.; flour, 2½c. to 3c.: corn, 50c. per bushel; wheat, $1; potatoes, 50c. to $1; apples, none in the market: cotton and tobacco are going at very low rates. Lands, if at all salable, bring only half former prices, and rent for less than half of old-time figures. Yet, on the whole, the outlook is encouraging. Frugality and thrift—and these virtues only—can get us out of our troubles. B. F. T.

N. Y., Corning, Steuben Co., Jan. 31.—The weather is now very pleasant and the snow is nearly all gone, except in sheltered spots and along fences; but we shall likely have more before long. Until within a few days, it had been quite steady cold since the fore-part of December. We have also had quite good sleighing since about that time, which is something quite unusual for this locality so early in the season. Every snow that has fallen has been very dry and the wind piled it badly up beside the fences and into the roads, so that in many places the roads have been abandoned altogether, and teams have gone around through the fields. It has been a good time for lumbering, and those who had much teaming to do, have been quite busy. The snow came so early that but very little frost is in the ground. Prices of produce seem very low, but when compared with those of most articles which the farmer has to buy, they stand about the same as during several years back; that is, five dollars' worth of produce will buy nearly, if not quite, as much now as five or six years ago. Hay is selling for $5 to $7 a ton. F. H. D.

MAINE, Paris, Oxford Co., Feb. 6.—Plenty of snow for the lumbermen in the northern part of the county. The Lewiston Steam Mill Co. propose to land over 5,000,000 feet of spruce and pine on one of the Rangeley lakes the present winter. The farmers are getting about 75 cents per bushel for potatoes, which are taken by railroad to the Boston market. Several thousand bushels have been sent from this county. The Early Rose command from 5 to 8 cents per bushel more than other kinds, a fact which proves it pays to raise improved kinds of potatoes. The farmers of this State propose to give the corn crop extra attention the present year. It has been proved that good corn can be raised in this State at an expense of 41 cents a bushel. The proprietors of the Lewiston Journal, the leading paper among the Maine farmers, have offered a cash premium of $50 for the best acre of corn raised in the State in 1879. This paper advocates the raising of more corn and wheat at home and sending less money for these products to the West, though the railroads receive the larger part of it for freight charges. S. M. D.

ILLINOIS, Rockford, Winnebago Co., Feb. 3.—We have had a fine winter with from 12 to 14 inches of snow, and six or seven weeks' good sleighing. There have been no bad storms or snow drifts to interfere with traveling. We have had some pretty cold weather, however, the mercury having dived down 20° below zero several times. That wonderful piece of vertebra, the winter's backbone, has now been broken, however. For the last ten days a warm thaw has destroyed sleighing, but left us excellent wheeling. Last season the crops were all good in this county, except potatoes, and of these there was an abundance raised for our own use. Our grocers are now retailing them at 60c. per bushel. In our wholesale markets wheat is selling for 75c. per bushel; corn, 23c.; rye, 40c.; oats, 20c.; hogs, $3; beef cattle, $3.50@3.75 per cwt. We have lost a good many hogs by hog cholera. J. D. H.

MAINE, Brooks, Waldo Co.—The winter, since New Year's, has been steadily and at times severely cold. The mercury has been down to 24° below zero. Stock of all kinds is doing well at the stables, and there is no epidemic disease throughout our borders. Hay is worth $6 to $10; butter, 8c. to 16c.; eggs, 22c.; cheese, 8c. to 12c.; corn, 55c. to 60c.; potatoes, 65c. to 80c.; and stock rules low. The Legislature, which is now in session, proposes some needed reforms in cutting down salaries and curtailing needless expenses. There promises to be considerable immigration to the newer lands in the Northern part of the State, about equal to the emigration that will leave us for the West. With the increase in production of wheat and corn, that has taken place in the past ten years, carried forward for the next ten years, Maine will produce her own bread and corn. J. W. L.

ILLINOIS, West Jersey, Stark Co., Feb. 3.—This winter we have had more snow and better sleighing in this State than white folks have ever had since the departure westward of the red man. Although we have had some pretty severe weather, I think the farmers have enjoyed this winter better than last. Our first snow was on the 8th of December, and ever since we have had good sleighing until the last three or four days, during which the snow has been rapidly thawing, so that now sleighing is pretty well over for the present. Produce is very low and farmers complain of the scarcity of money. M. E. M'C.

ILLINOIS, Risdon, St. Clair Co., Jan. 31.—We have had the coldest spell of weather this winter that we have had for years; the thermometer reaching 17° below zero on the morning of the 3d inst. So far as we are able to learn, fruit is injured badly, and a majority think the Peaches are all killed. There is no question but that the weather has injured wheat, as the cold spell commenced with sleet, and the drill rows were all filled first with ice and then with snow. There is very little wheat held over here, nearly all the farmers having sold all they could spare. A very few, however, are holding for better prices. N. J. S.

CANADA, Oxford Co., Ontario, Jan. 29th—We have had steady winter weather for the

last six weeks; a big bluster occasionally, but no thaw; lots of snow and that badly drifted. Times were very dull, but they have improved a little on the arrival of the sleighing. A good many men are still out of work; wages 50c. per day and board. Prices are as follows: wheat, 70@88c. per bushel; barley, 40@60c.; oats, 28c.; peas, 50@60c.; corn, 50c.—not much grown;—hay, $8 per ton; beef, 4@5c. per pound, live-weight; pork, dressed, $3@3.50; potatoes, 80c. per bag; apples, 50@60c. per bag. We think prices have touched bottom.

G. K.

ILLINOIS, Hugo, Douglas Co., Jan. 31.—It is hard to describe the straitened monetary condition of our people hereabouts. Even among those considered our wealthiest citizens it is no easy matter to collect even small debts. "No money" or "wait a little" is the usual answer to a request for payment. If the farming community could only be induced to take the RURAL, or even an inferior agricultural paper, and to act upon its teachings, I feel confident that they would be in a fair way to better farming and easier times. Prices are: corn, 18c; potatoes, 50c; wheat, 75c; apples, none for sale; oats, 12½c; hay $3.00 per ton (!!!); hired hands, $10 to $15 per month; land, $20 to $30 per acre; hogs, $2.10 per 100 pounds. Every thing is low, even our spirits.

A. C. W.

LABORERS' WAGES AT MEMPHIS, TENN.—With reference to this subject a friend—a business man of Memphis—writes to me as follows:—"Wages are low here. Negro men get from $8 to $12 a month. The best white labor—and people are cautious about hiring white labor on account of so many men representing themselves as laborers who have never done an honest day's work—commands from $12 to $15 or $16 a month, with board. It takes the very best labor to bring the outside figures."

W. F.

KANSAS, Phillipsburgh, Phillips Co., Jan. 25.—The early sown fall wheat looks well, but the late sown is thin on the ground. The weather was so dry here in the fall that it did not all come up. Wheat is worth, in Phillipsburgh, 30c. to 40c. per bushel; corn, 35c.; oats, 30c.; potatoes, 25c. to 30c.; butter, per lb., 15c.; eggs, 12c. per dozen; cows, $20 to $35 each; horses, $75 to $100; draft cattle, $100 per yoke. The Yucca filamentosa, or Soap Plant, grows well here, so do the Sensitive Rose and many other nice flowers.

V. B.

KANSAS, Oxford, Sumner Co., Feb. 3.—I do not think that men who have homes and families should allow themselves to be overcome with the mania for coming West—as many do. We do not want maniacs. We have plenty of room, however, for those who read such papers as the RURAL, and after fully investigating the matter, come hither as a matter of business. For such men there are plenty of business openings here.

The Poultry Yard.

CARE OF POULTRY IN WINTER.

FARMERS often complain that poultry are nothing but a bill of expense in the winter. As managed by some farmers who make their hens roost on trees, it must be confessed that hens make little return, but this is not the fault of the hens but of the owner of the flock. If a man wants eggs, he must get a good breed, give them comfortable quarters and suitable food. Hens are egg-making machines, and they will turn out just as many eggs in winter as in summer, if they have proper care. Eggs are worth twice as much in winter as in summer, so it is worth while to take some pains to have the production as great as possible. Some persons feed their poultry pretty well, but they give them no egg-shell material. To furnish the raw material for manufacturing egg shell, I have never found anything better than bones, and clam or oyster shells pounded fine. Hens should have a mixed food—corn, oats, wheat, rye, buckwheat, etc. Thick sour milk with wheat bran or boiled potatoes, fed warm, makes an excellent food on winter mornings, for laying hens. Six or eight years ago I kept Brahmas, Cochins, Hamburgs, etc. One day my father said, "Why don't you get the White-Crested Black Polish fowls? They were the best I ever had." I bought a trio, paying $12 for them. Now, I have five years' experience with them, and I have found out that they have more good points than any other breed I have had. In the year 1877, I had twenty-five hens and they laid 4,575 eggs—381 dozen, or 183 eggs per hen. In the year 1878 I had twenty-five head again, and they laid 4,250 eggs—354 dozen, or 170 eggs per hen or pullet. In the year 1877 I had more pullets than in 1878. Some of my neighbors keep White Leghorns and their hens averaged only 150 eggs per hen.

"The sparkling, bristling, earnest, independent
"RURAL NEW-YORKER."

Professor E. M. SHELTON of the Kansas Agricultural College says:
"*The* RURAL NEW-YORKER *has more influence and is more quoted than all the rest put together.*"

For the largest Farms—the smallest flower plots—for the crops in the fields—the vegetables and small fruits in the garden—for the Herdsman, the Dairyman, the Apiarian everywhere.

For the Country, Village and City---For everybody that loves his home and desires so to elevate agriculture and horticulture that they shall be recognized as the noblest pursuits of men.

B. PICKMAN MANN of Cambridge says:
"*For years I have taken the leading agricultural journals, and they all seem* TAME *when compared with the* RURAL NEW-YORKER."

The most vigorous and able combination of practical writers ever before collected together in the columns of any journal.

2d YEAR OF ITS PRESENT MANAGEMENT. 30th YEAR OF ITS AGE.

Professor WM. J. BEAL of the Michigan Agricultural College:—"*The* RURAL NEW-YORKER *is now the* BEST *paper.*"

CHARLES DOWNING says:—"*I am glad for the public as well as for yourselves that the* RURAL *has so much improved.*"

Thousands of plant cuttings and seeds have been distributed free to subscribers during the past year—and our present Free Distribution of Seeds will, we believe, when they shall have been tested, be regarded as the most liberal offer of the kind ever before made.

Pearl Millet and Defiance Spring Wheat (now selling at not less than $15 per bushel each)—the Beauty of Hebron Potato—Golden Rural Tomato, Bronze Ricinus and sixteen varieties of seeds of our choicest hardy shrubs (most of which are not offered for sale), will be found in our present collection. (See page 113.)

Pres. T. T. LYON of Michigan says:—"*The* RURAL *is the best paper I see.*"

Sec'y C. W. GARFIELD of Michigan says:—"*I find that the* RURAL NEW-YORKER *has more things in its columns that I want than any other paper I take.*"

Ex-Gov. FURNAS of Nebraska says:—*The* RURAL *is most welcome to my table and family.*"

Dr. E. LEWIS STURTEVANT of Boston says:—"*The* RURAL NEW-YORKER *has the best list of contributors of any paper of its class in the country and is doing a noble work.*"

S. RUFUS MASON of Nebraska says:—"*I feel that I do not flatter anybody when I say that it is the* BEST *journal of its kind that I ever saw.*"

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, FEB. 15, 1879.

The several statements in our columns to the effect that we intend to send trial lots of corn to our subscribers, have brought us a great number of premature applications. Now we beg to state that, being in the very midst of our other free seed distribution, we CAN NOT *regard these applications. The announcement in relation to the corn will be made in a few weeks. As we believe, the variety to be offered is the most prolific of any hitherto cultivated. It was for this reason that we have hastened to secure a quantity sufficient to supply every one of our subscribers who may apply with enough to give it a fair trial.*

We will be pleased to send one or more copies of the RURAL NEW-YORKER *free to any of our subscribers sufficiently interested in its welfare to be willing to hand them to their neighbors for inspection. An intimation by postal card will suffice.*

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to* THE RURAL PUBLISHING CO., *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

Applicants for seeds will please observe that the postage on ANY POSSIBLE *selection of* TEN *sorts of seeds,* IS NEVER *more than* FIVE *cents.*

A ONE-CENT *stamp suffices for any selection of ten varieties* EXCLUSIVE *of the Beauty of Hebron potato, Pearl Millet and Defiance wheat. If the first of these three is included in the list, then a two cent* EXTRA *stamp is needed, and if the second and third are included, an extra two cent stamp is also required.*

OUR readers are particularly requested to read the particulars of our free seed distribution on p. 113, under publisher's notices, before ordering seeds.

LESSON OF THE FAT-STOCK SHOW.

THE rapid progress made during the last two years in opening a profitable market abroad for our best live cattle and best fresh beef in the quarters, makes it more important than ever before that the American farmer should study carefully the laws of animal growth. And it may be considered most opportune and fortunate that a fat-stock show was instituted which has demonstrated one of the most important of these laws. The saving of even two per cent. in the manufacture of cotton goods often makes all the difference between loss and liberal dividends. Taking a hint from this, the farmer may easily find in his business a leak of from 10 to 50 per cent.

Let us take a look at the facts disclosed at the late Fat-stock Show at Chicago. Here we must expect to find only cattle that have been well fed and have lacked nothing to make them fine specimens of their breed and age. They were brought there to compete for high prizes, and, having been of different breeds and ages, a careful study of them will disclose some important facts which may be generally applied to cattle feeding. We desire our readers to make a careful review of the prize animals, published on page 8 of this volume.

The RURAL has often called attention to the fact that profitable beef raising can only be found in *early maturity*. This show gives such remarkable examples of this point that we have taken the average of four classes of Short-horns and their grades, animals of about equal merits for beef. These being prize animals and all fed to the best advantage, illustrate in the most admirable manner the effect of age on profit in feeding. We have arranged them accordingly in classes of four each, as follows:

	Average age. Days.	Av. weight. lbs.	Av. gain per day. lbs.
4 Steers,	669	1,420	2.13
4 Steers,	967	1,637	1.74
4 Steers,	1,281	2,166	1.69
4 Steers,	1,890	2,332	1.32

Here is a lesson of the greatest value to every feeder. It shows conclusively that it costs much less per pound to make beef when the animals are under two years old than when they are beyond that age. It may be said that in each succeeding month in the life of a steer, it costs more to grow a pound of beef than in the preceding one. But the falling-off in gain per day does not include all the loss—scarcely half of it. If the reader will examine this table, he will see that between 669 days and 967 days, or for 298 days, the steers only gain 267 pounds, or .89 of a pound per day, instead of 2.13 lbs. per day; but the steers will eat at least 30 per cent. more during these 298 days than during the same number of days of the previous period, so that each pound of flesh put on, will cost more than twice as much per pound for the second as for the first period. And during the next period, it will cost still more to put on a pound of growth; and this cost increases the older the animal grows until it reaches full maturity.

The philosophy of this increase of food is found in the fact that the older and heavier the animal grows, the more food it takes to keep up animal heat and supply the waste of the system. This waste constantly increases according to the age of the animal, and thus, whilst the food necessary to support the animal is constantly increasing, the part of it applied to meat production is constantly decreasing, and upon the food of meat production depends all the profit.

Every farmer ought to see from this illustration, that all his animals intended for meat, should be pushed without any standstill from weaning age to market day.

CHANGE OF SEED.

IF not already done, it is none too soon to look out for good seed for the crops of the year. The farmer may be a good one. He may have saved his own seed for many years in succession. He may have continued to improve it. This is all right and proper, but *a change will be a benefit, or rather he will gain a large percentage in the yield by obtaining seed of the same variety he now raises, and then mixing it with the seed kept for years on his own place. The advantage of this mixture will not be apparent until the second year. It will be less and less apparent for several years after.* The ideas expressed by the words in Italics are not the outcome of guesswork or theory. They are the result of many experiments made for ten or twelve years by Mr. Charles Darwin. Professor Beal has also lately made some experiments in the same direction, showing a great advantage in mixing seeds of the same variety grown in different places. He promises to furnish us the result in a few weeks.

OUR SEEDS.

WE shall be sadly disappointed if our friends do not meet with gratifying success with the seeds we send them. With the seeds of Weigelas, Deutzias, Yuccas, Hibiscus Syriacus, H. Moscheutos, etc., etc., we have never had the least trouble. They germinate under ordinary treatment and the young plants transplant well and thrive lustily. Many of them will bloom the second season, which is all they would do if the plants were purchased from the nurseries. Besides, and this has always been to us a fascinating part of seedling culture, some of them will so differ from the parent plants as to constitute distinct varieties. Again, they are all of them hardy and are generally looked upon as among the most desirable shrubs for our gardens and lawns.

We shall send these seeds to thousands of rural homes throughout the country, and we hope that two years hence, if not before, we shall have abundant evidence that the endless botheration and expense which attend these distributions have not been in vain.

Agricultural Report for 1878.—We wish the newspaper editors who have been disparaging the fitness of Gen. LeDuc for the office he holds, would read his last report, extracts of which appear in this and the last issue of the RURAL. He has been blamed for suggesting the introduction into general cultivation of several plants which his critics do not think could be profitably grown in this country. Some of these, they say, have already proved failures here, which is true; and others, from their own inward consciousness, they are certain will not succeed; but we are all fond of boasting that this is an age of rapid progress, and hence the failure of an enterprise in the past should hardly be deemed conclusive of its failure today. And with regard to the untried plants, whose adaptability to our present agriculture promises profitable additions to our list of products, an opening for the employment of our superabundant labor and a help in our present distress, wisdom and common sense demand a trial for them, and this is all the Commissioner asks. We cannot help thinking that political prejudices rather than the good of agriculture have prompted many of the low attacks upon Gen. LeDuc which have been made from time to time.

Geranium sanguineum.—We are obliged to discontinue our offer of seeds of this plant. Anticipating our supply would fall short of the demand, we sent an order for a quantity to Mr. B. S. Williams, of London, and to the Lawson Co. of Edinburg, requesting that if they could not fill the order, they would endeavor to procure the seeds from other seedsmen. The reply is that, in spite of diligent inquiry, they are unable to send us any. It is strange that our American seedsmen seem to know nothing of this desirable plant;—desirable, because it is everblooming and perfectly hardy; because its leaves are pretty and nearly evergreen; because it spreads over the ground; grows compactly and leaves little to be desired for bedding purposes. We shall increase our stock as fast as we can, and again offer seeds of Geranium sanguineum to our subscribers in the fall. Meantime we request all who succeed in raising plants to save all the seeds which their plants bear.

BREVITIES.

QUESTIONS and Answers are crowded out this week.

THE distance of only twenty feet apart is now advocated by several good apple growers.

"BLAME is bestowed by those who wish you prosperous and those who fear that you will be so."

MOST of our readers are not aware of how beautiful the finest strains of the dwarf, double Hollyhocks are. There is no other flower that has been really improved by florists more than this.

"NOT to distort nature," says Mr. Meehan, "but to encourage her towards her best efforts, is surely a worthy object of the garden art,"—which means that "nature must be judiciously directed by art."

WE are thinking about offering to our subscribers a premium for the largest yield of corn from the seed we propose to send those who apply for it. In this case we shall be careful to send the *same* amount to all.

THE CORN number of the RURAL NEW-YORKER will be issued next week or the week after. In it notice will be given of our free distribution of what we call the most prolific variety of corn in cultivation, for all sections to which the variety is adapted. We have secured a sufficient quantity to furnish all our readers who apply, with enough to give it a fair trial.

N. Y. STATE DAIRYMEN'S ASSOCIATION AND BOARD OF TRADE.

IT was my privilege some five years ago to attend Dairymen's Conventions throughout the country and catch the drift of the general discourses on milk, cattle, cheese, butter and kindred subjects. After returning to my home in Kentucky, I was asked to explain some of the fresh thoughts I had brought back with me. My reply was that had I been visiting some old lady in central Kentucky, I would have heard the same old story on butter-making that the very learned butter expounders of the North had been pouring into the ears of their confiding listeners.

I return after five years and sit in convention and listen to the same old story, "Come here, my child, and I will tell you the story of my wedding-day," certainly something fresh and startling! Such was my experience on my first visit to Utica.

Everything was serene and happy. The Convention was evidently gotten up for harmony. But let us change the scene. A few weeks later I attend another Convention at Utica. Here there is no effort at harmony. Men are at liberty to say just what they think. The market for twelve months has been in a ruinous state of depression. Men are sick of flattery, and getting hungry for the truth. Seeing the necessity for looking things squarely in the face, President Folsom brought together the freshest, brightest, most original and independent speakers it has ever been my pleasure to listen to. In a clear-cut and manly manner, in his opening address, he set forth the prime necessity for a lessened supply or increased demand in the cheese market. With a merchant's mind directed to the latent power of organization, he pressed the dairymen to form county associations, just as merchants form their boards of trade. He told the farmer in no flattering terms, that while Canada was improving in the quality of her cheese, the makers of the State of New York were absolutely deteriorating in the quality of theirs; while the West was a dangerous competitor. He impressed upon the farmer the importance of making a more solid cheese that will ripen quickly, and yet stand a trip across the Atlantic in summer without deteriorating in quality. At the same time he called attention to the fact that cheese made now is ripened in ten or fifteen days, while in former years, twenty-five to thirty days were considered none too long for perfect curing, to which change may be attributed the bad keeping qualities of this season's make.

A letter to the Convention was read from Mr. Henry Kemp, one of the oldest dealers in New York City, treating of the export trade from 1840 to the present date. He divided the subject into five epochs, tracing step by step the gradually accelerating exports from the beggarly sum of 11,666 boxes in 1840 to the flood of 2,133,225 boxes that overwhelmed the market in 1878. [If the quality had only kept pace with the quantity, America would be the foster-mother of the world.] Mr. Kemp is evidently a great admirer of the commercial laws of England, and makes the capital point that how can we expect the English artisan to buy our goods if we make laws refusing to receive the products of his handiwork. In other words, if you do not buy of him, he will not have money with which to buy of you.

H. K. & F. B. Thurber made the convention a present of one of the fine Cheddar cheeses that took the premium at the International Dairy Fair. This was cut and handed round to the cheese makers, who were taught a good lesson by being able to compare their own make with this sample of the finest product of their competitors. The letter called attention to the necessity of our makers studying the tastes of their English customers; and while it praised the intelligence of the American farmer as being much above the average, at the same time he must not imagine that his English competitor is standing still, and the progressive thought abroad was evidenced by an English address, freely quoted, and full of warning to the English farmer.

THE PHYSICAL REACTION OF MILK.

This subject was treated very cleverly by Mr. O. S. Bliss, of Vermont. Much of this address was scientific and related to the conflicting statements of our speculators on the component parts of cows' milk. Mr. Bliss gave us his original ideas on the manner of testing skim-milk to tell whether or not all the cream had been taken from it. Taking first as a standard, the heaviest skim-milk reported in the books, he found that his method of cooling milk had produced the heaviest skim-milk on record and, arguing *a priori*, he had produced the most perfect method of creaming milk, yet discovered. This paper called forth pretty general discussion, showing that the dairymen's ideas are by no means a unit on the all-important subject of raising cream.

EASTERN AND WESTERN BUTTER MAKING.

This was a paper read by L. S. Hardin and consisted in drawing a strong contrast between the two rival methods. It was shown by a paper read at the late American Dairymen's meeting, reciting national statistics, the subject having been illustrated with maps, that New York was not only the most prosperous, but the very center butter-producing district of the country. Mr. H. called attention to the fact that these statistics were taken from the Government report for 1870, nearly ten years ago, while the daily quotations in the New York papers show that Western butter is selling from six to eight cents a pound in advance of Eastern or New York make. The New York Dairyman has his cows all come in fresh in the spring. The milk is all produced when butter is hardest to make and selling at lowest market rates, thus requiring that it should be held over and come into the market "strong and venerable with age." Against this old obsolete method the Western farmer works his cows the year through. His butter is made from cream that is sweet and pure, and is shipped in refrigerator cars and reaches the consumer when hardly three days old, "fresh and rosy as the blushing morn."

CONSUMPTIVE DEMAND FOR DAIRY PRODUCTS.

This subject was treated by Mr. X. A. Willard in a most exhaustive manner. To say it was the best paper I ever heard Mr. Willard read is paying it a high compliment indeed. Now that the conflict between the English and American cheese-makers had begun in earnest, he felt cheerful with regard to the result in view of the progressive spirit of our dairymen, and especially the cheap cow feed of the West. We must, however, keep a strict eye to the question of quality. He called attention to the fact that while the Englishman consumed 16 pounds of cheese per annum, we use scarcely one-fourth of that quantity. Our cheese-makers must make the finer brands and in greater variety for the home market. He spoke with earnestness against going back to the old method of making cheese from sweet curds, giving at length the history of the rise and decline of this heresy.

COST OF PRODUCING CHEESE IN 1878.

This was the subject handled by Secretary Gilbert with the cautious care due to figures. By means of printed circulars he had gathered reports from a host of farmers, showing exceedingly close work for this season. The cost of production per cow was, gross, $39.70, while the gross money product was $47.25—no very encouraging exhibit, it is true, but as the cost came mostly out of his own labor and farm, the farmer is able to stand it. There were many interesting special items, but there is not room to report them. H.

EXTRACTS FROM THE REPORT OF THE COMMISSIONER OF AGRICULTURE.

(Concluded from last week.)

The sugar thus obtained was very greatly improved in appearance by the addition of five or ten per cent. of water, and stirring it into a mush, and again subjecting the mass to pressure, by which operation the adhering molasses was almost entirely removed, and the sugar obtained was, in the case of sorghum, nearly white, while in the case of corn it was of a rich golden yellow. I may add that in no case, either with corn or sorghum, did I fail to obtain satisfactory results in the way of crystallization, although, of course, the molasses still contains a very large percentage of crystallizable sugar, which will, at least, in great part, be obtained by further concentration. . . .

The point which these experiments have fully settled is, that there exists no difficulty in making from either corn or sorghum a first-rate quality of sugar, which will compare favorably with the best product from sugar-cane grown in the most favorable localities.

After a few minutes the sediment from the juice subsided, and by means of a syphon the clear liquid was decanted off, leaving a muddy sediment which was equal to about one-tenth to one-twentieth of the bulk of the juice. This muddy sediment was then drawn off by means of a stop-cock, and filtered through a plaited-bag filter, and the clear filtrate therefrom was added to the liquid previously syphoned off.

The clarified juice which, during the above operation, is not allowed to cool below a temperature of 66 deg. Centigrade, or 150 deg. Fahrenheit, was now emptied into the evaporating pan, and there was added to it, with stirring, a solution of sulphurous acid in water, until the lime present was neutralized, as was shown by the reddening of litmus paper when it was dipped in the juice. The evaporation was now hastened as much as possible, and the juice concentrated to a sirup at a boiling-point of 108 deg. Centigrade, equal to 226 deg. Fahrenheit, or thereabout. . . .

On account of the trouble in stripping the stalks, experiments were made with stalks unstripped, the tops alone being removed, and these experiments appear to prove that this troublesome operation of stripping may be avoided without any diminution of the amount of juice or of sugar obtained therefrom.

Below are the results obtained from stripped and unstripped sorghum, calculated to the raw stalks used.

By raw stalks is meant the stalks as they were cut in the field, leaves, tops, and all.

	Average per cent. of juice to raw stalks.	Average per cent sirup in juice.
Stripped sorghum (Nos. 5 and 6)....	35.02	15.00
Unstripped sorghum (Nos. 7 to 11, inclusive).....	40.60	15.47

The character of the maize and sorghum operated upon still remains for consideration. As has been already stated, the maize-stalks had been stripped of their ears three or four weeks before they were cut for the mill. It is much to be desired, and is contemplated in the further experiments, to determine whether this was the time when their content of sugar was at the maximum. It is by no means improbable had they been cut when the grain had begun to form, and was still in its milky state, that the product of sugar would have been greater. At least further experiments are needed to learn at what time the stalk may be most profitable as a sugar-producing plant. . . . . The experiment with millet, already mentioned, gave very interesting results, and it promises to be a new sugar-producing plant of considerable value. . . . By the treatment of this juice by the process already described, 24¾ pounds of juice yielded 2¼ pounds of sirup, which speedily crystallized, yielding an excellent sugar, which polarized 92°.

An experiment was also made with a small lot of sugar-beets, received from F. D. Curtis, of Charlton, Saratoga County, New York, the object being to learn whether the process for the preparation of sugar from corn and sorghum, as above described, was applicable to beets; 14.5 pounds of sugar-beets were ground up, and 7.87 pounds of juice were expressed, having a specific gravity of 1080. This juice yielded a sirup which crystallized readily within twelve hours, and yielded .61 pound of sugar, which polarized 91°.7, and .58 pounds of sirup, from which an additional quantity of sugar may be doubtless obtained.

SILK CULTURE.—Last spring, through the courtesy of Mr. Long Tsuda, a valued correspondent in Japan, the department was presented with a few cards of the eggs of a kind of silk-worm known as the *Yana Gawa*, a valuable race, producing a small white constricted cocoon. The worms were fed on three different species of *Maclura*, or Osage Orange, and on eight different species of Mulberry, as well as on some other allied plants, by way of experiment. Another race that has been fed for the last eight years on Osage Orange by Professor Riley was also grown. A part of the silk from these worms has been reeled in this country by Mr. L. S. Crozier, of Silkville, Franklin County, Kansas, and proves to be of the very first quality. But the most interesting fact in connection with these experiments is that the silk produced from the Osage-orange race, which was originally a cross between the best French and Japanese worms, actually proved superior in quantity and equal in quality to that fed on Mulberry. . . . There can be no question as to the adaptation of the larger part of our country to the silk culture, or of our ability to grow the worms successfully. Experience has established these two facts, as it has the superior quality of American-grown silk. It is not so necessary to urge the cultivation of the Mulberry as it is to establish first a market for the cocoons. In some parts of the South the best of white mulberries are already grown in large orchards, for the sake of the fruit, which is deemed most valuable food for hogs, and in case the Mulberry trees already grown should at any time be cut off by mildew and disease, as they were at the close of the Multicaulis fever in 1839 and 1840, we have the advantage over Europe and other countries in being able to fall back upon the *Maclura*, which proves, when judiciously fed, to be as good as Mulberry.

TOBACCO CULTURE.—The tobacco crop does not promise so large a yield this year as last, but the quality is much superior. Later returns are necessary before any estimate of the quantity can be made. . . . The following table presents the number of persons engaged in the different occupations in the United States at the last enumeration:

Population.	1870 (census).		1878.	
		Per cent.		Per cent.
Total over 10 years.....	28,228,945	.....	34,000,000	.....
Males in all occupations.	12,505,923	.....	15,000,000	.....
Agriculture.....	5,922,471	47.35	7,600,000	50.66
Manufacturing and mining.....	2,707,421	21.65	2,900,000	19.33
Professional and personal.....	2,648,793	21.47	3,000,000	20.00
Trade, commerce and transportation	1,191,238	9.52	1,500,000	10.00

The agricultural interest being valued at 38 per cent. of all others combined, the value of farms and property is $11,124,959,037.

Value of farms, 1870.....	$9,262,803,861
Value of farm animals, 1870.....	1,525,276,747
Value of farm implements, 1870.....	336,878,429
Total.....	$11,124,959,037

The increase of population over 10 years was somewhat above 21 per cent. At the same rate of increase of values of farms and farm products for 1878 would be as follows.

Value of farms, 1878.....	$11,207,992,671
Value of farm animals, 1878.....	1,845,584,863
Value of farm implements, 1878.....	407,622,899
Total.....	$13,461,200,433

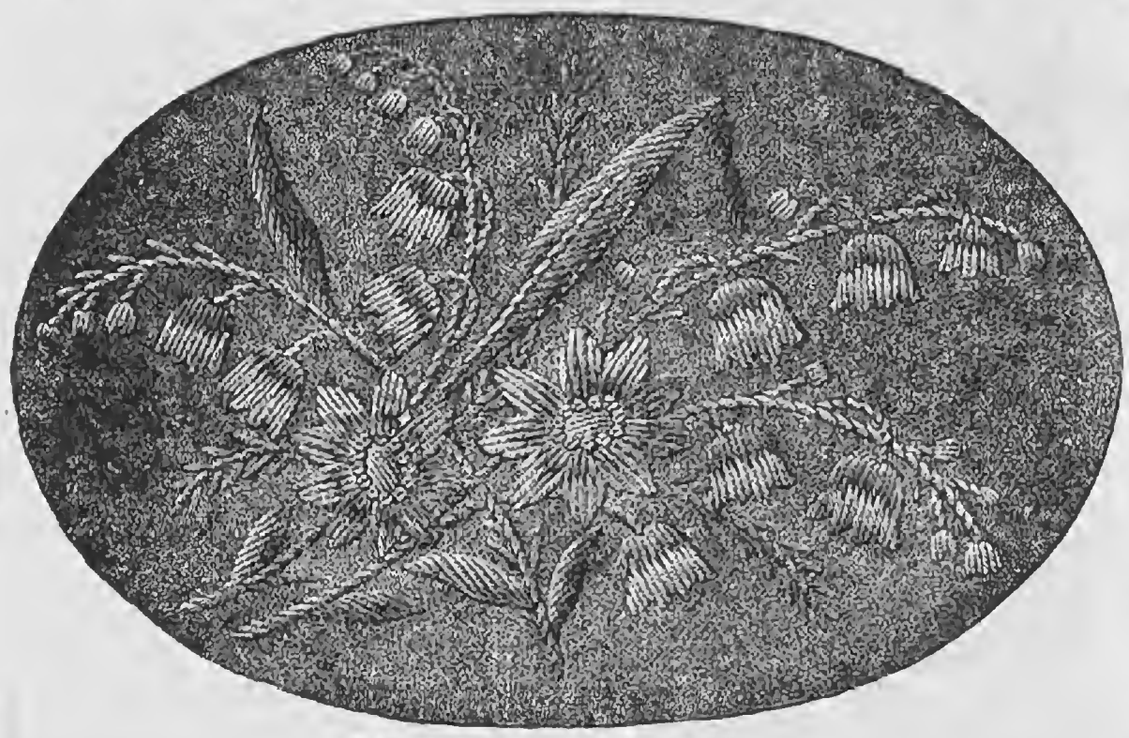
For Women.

CONDUCTED BY MISS FAITH RIPLEY.

CREWEL WORK.

"CREWEL" is a loosely twisted yarn or worsted, manufactured in all shades and colors. It is sold in two sizes, fine and coarse. The coarser make is that in most general use. The foundations usually employed for Crewel Work are unbleached linen—that known as Bolton sheeting is the material generally used for doyleys, toilet sets, chair-backs and one yard square table-covers. It is inexpensive. There are other materials which are employed for foundations of Crewel Work for various purposes, such as satin-dechine, twilled-silk, broccatine, burlaps and crash, linen, serge, diagonal cloth, gray and blue felt, flannel and Holland. "Crash" is the name of the gray linen, now so much used for Crewel Work. Round toweling may also be used. Crewels, are the only kind of worsted used for this artistic embroidery. They are made with only two plies, and then a loose twist causing them in working to form lines, which may be compared to the lines in fine engravings. In color, too they may be brilliant without being harsh. The embroidery silks are floss (coarse and fine) Dacca, Mitorse, silks and Filoselle, which latter is very durable, and far easier to work than floss, and also cheaper than silk. Gold and silver threads are also used. The needles used are ordinary round-eyed, and the long-eyed embroidery needles, the latter are used for Crewels and floss silks, and the former for twisted silks and cords and for gold and silver threads. Always choose a needle large enough. If you have to tug a needle through the material it is evident it is too small, and should be rejected, always select the best needles. Thimbles that have been worn smooth are the best, as they are not so likely to injure and catch the loosely twisted threads, a stiletto will be required to make holes for taking thick edging cords through the stuff.

To fringe doyleys, etc., cut a square of linen the depth of the fringe from each corner, and draw the threads out from four sides to the required depth. Take a needleful of Crewel (the skein for this purpose should be cut only once). Put the end of the Crewel to the edge of the frayed-out fringe. Then put your needle downward through the edge of the pattern about an eighth of an inch above the drawn threads. Now place the needle as close as possible to the left of where it was last inserted, pass the Crewel under the point of the needle from left to right, hold the Crewel firmly between the thumb and forefinger of the left hand until you have drawn up the stitch as you would a button-hole stitch, carry the Crewel on from space to space, and cut the fringe when you have finished sewing



NO. 1—MEDALLION IN CREWEL WORK.

in the loops. When Crewel work is finished it will be found that it has become much drawn and puckered. To remedy this, a clean cloth must be tightly stretched and pinned upon a drawing board or deal table, upon which the work must be placed face downward, stretched and pinned as tightly as possible. A wet sponge should then be passed over it till every part is made damp, especially that which is most puckered. When it has become dry again it may be taken up, and then it will be as smooth as if it had been ironed. In washing Crewel Work, make a lather of fine soap, and rub the article to be washed in it. Do not put a particle of soap on the work. Rinse in warm water and squeeze; do not wring. Shake well and stretch till dry; as directed for new work.

Crewel Work designs stamped on white or ecru linen ready for working, can be purchased at the following rates. Scrap bags, 3 for $1.75; single pattern, 45c.; school bags, at same rates. Wall pockets (with two pockets), 3 for $1.75; single pattern, 60c. Toilet sets, 3 for $1.25; single pattern, 45c. Tidies for chair backs or seats, 3 for $1.00; single pattern, 37c. Sofa cushions, 3 for $1.00, single pattern, 37c; chair stripes, larger size $2.50 and smaller size $1.50 for 3; single patterns in larger size 95c., in smaller, 55c.

The instructions given above, taken in conjunction with Miss Harvey's article on Crewel Work, published in RURAL of December 14, contain most that there is to be said about this style of artistic embroidery; but if any ladies want further information, I shall very gladly furnish it to them. Please address all letters relating to fancy work and fashions to Faith Ripley, care of RURAL NEW-YORKER.

Description of Cuts.

At A and B are shown methods of working the crewel-stitch. The length of each stitch must be left to the taste and judgment of the worker, who can make them suitable to the coarseness or fineness of the material to be worked on, making also due allowance for the abruptness of the curves. A closer stitch and more solid work are required for articles that are intended for use rather than for mere ornamentation. For instance, the stitches in this case should be evenly and smoothly made, and should resemble the woof of satin. In working, the outline is to be covered first; and in such work as the stalk of a flower, begin from the lower end first and work on until it is crossed by a leaf or ends in a flower, then pass the needle to the other side and work downwards then make another line of stitches inside the outline until the stalk is filled up. See B.

In more elaborate Crewel-Work designs the satin stitch may be used. The stitch is made in passing the silk from one outline to another. A piercer comes in useful here for keeping the stitches even and smooth. When it is desirable to raise any portions of the work, it may be done with cotton and silk taken over it. See J .K. L.

NO. 1.—MEDALLION IN CREWEL WORK. The ground-work is unbleached linen. The design, which consists of lilies and blue corn-flowers, may be worked in their natural colors, and will serve for ornamenting table covers, drapes, for baskets, toilet sets, etc.

NO. 2.—DESIGN IN EMBROIDERY. This design may be worked in crewel or silk, in their natural colors, or in several shades of one color as preferred. It can be used for sachets, bags, book covers, chairs, etc.

NO. 3.—EMBROIDERED STRIPE. The foundation may be cloth, velvet, crash or linen worked in silk or crewel. The work is in the natural colors of the flowers and foliage. The stripe can be used for ottomans, chair backs, etc.

NOS. 4 AND 5. These little sprays are pretty for ornamenting pin-cushions, toilet-cushions, etc. They may be worked in crewel, embroidery cotton, or silk, according to the material to be ornamented.

MISS HARVEY'S REPLY TO THE CRITICS.

DEAR MISS RIPLEY:—I find I am being criticised, but I believe unjustly. One of your correspondents has lately taken me to task for saying that I do not believe in the woman who does not know how to sew. Perhaps I will be indulged if I tell *why* I don't. It is because I think every true woman will instinctively seek first of all to perform the duties nearest at hand, acquiring the lowlier arts in common with all her sisters before rising beyond them. I know I should be ashamed to sit down to paint, or embroider or play the piano, if I did not understand how to make a garment, dust a room, or get a meal as well as most women do.

Again, some one finds fault with my saying that every lady ought to have a black silk dress always available, adding, as though giving me a suggestion, that purchasing one is a bad investment, unless one has another dress to save it. I do *not* remember remarking that the young lady described hadn't a single suit to her back until she got the silk, and I do remember saying that she soon after bought a cashmere, trimming it with pieces left from the better material. If she wore the less costly dress at all, wearing it must certainly have saved the other. I think I also intimated that she had a serviceable *de bege* for every day use. I am sorry I cannot always make myself understood. Very truly,

MARGARET B. HARVEY.

PRICE OF PHANTOM WORK.

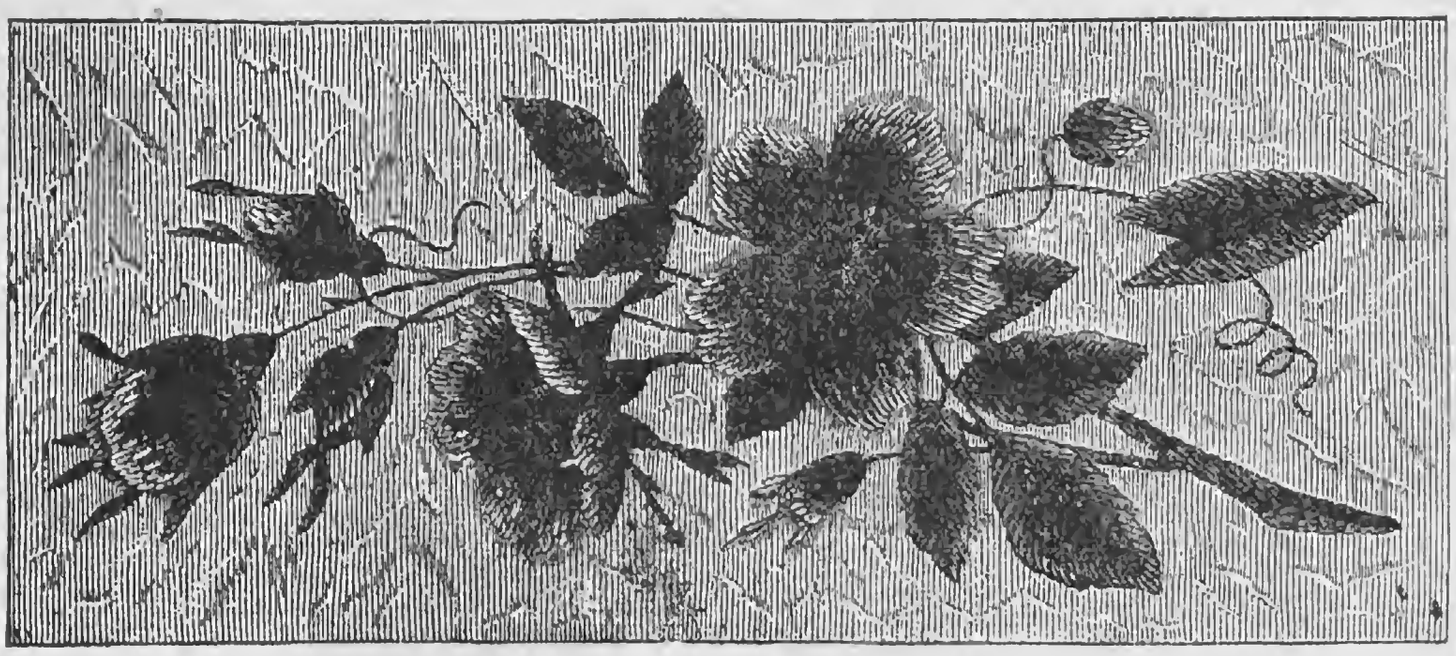
I AM sorry I cannot give, in reply to the inquiry of Mrs. Post, a satisfactory answer.

The value of phantom work depends altogether upon the quality and the market. In the cities such artistic tid-bits occasionally command high rates, but the present over-supply of fancy productions and fancy workers must, materially, affect market values.

A fern-leaf faultlessly wrought and of medium size would probably sell for fifty cents. There was a time, not long since, when it would have brought four times the amount.

ROSE GERANIUM.

A LARGE design in Crewel work will be published next week. It was crowded out of this issue.



NO. 2—DESIGN IN EMBROIDERY.

WILL some of the ladies tell Mrs. H. B. K. how to make white wax lilies? Please send answer to RURAL NEW-YORKER office.

THE address of Margaret B. Harvey is No. 116 North 11th St. Philadelphia Pa. We would suggest that those who write to her for information should not omit to inclose a stamped envelope or a postal card addressed to themselves. It is hardly just that Miss Harvey should be expected to pay postage on replies to questions sent to her.

Literary Miscellany.

THE TRAMPS.

A WOMAN and man; she pallid and wan,
And with sad eyes, hollow from fasting;
His, glassy and marred by the drunkard's reward,
That still about him are casting
With that death-eager look of that terrible thirst
That has borne him and torn him down from the first

As they stand in their shame by the bright kitchen flame,
With despair in each shivering motion,
What a story I read of man's madness and greed
And of woman's angelic devotion—
Of the wonderful love of two ill-mated lives,
Which still, in its storm-trampled embers, survives.

Does her memory stretch from that poor, bloated wretch
Far back into days that were golden,
When his love, first breathed, seemed a treasure bequeathed,
For which she was ever beholden?
Surrounds him still with the illusion of yore
Through which women behold the men they adore?

Aye; there, as they stand, she touches his hand—
The hand of the sot and scoffer—
And a gleam of old grace lights the sad, shrunken face
As she turns to the food that we offer,
And gives him the larger share—wolfishly thrust
To his lips ere her hunger has broken a crust.

Then, their rags closer bound their chill frames around,
They pass on the way of the vagrant;
For wretches so mean in good homes to be seen
Would be a transgression most fragrant;
But the woman half turns, with a wave of the hand
And a sad, thankful look that is simple and grand.

And I look through the panes, as the brief day wanes
And the shadows of night are blending,
